to think that the common home-maker in the country needs an exhaustive list of all sorts of trees, and shrubs, and elaborate descriptions, without discrimination. Mr. Parsons has undertaken to give such information as he thinks essential for what we would generally call "small places." One of his chapters is specifically devoted to these modest homes. The lawn does not seem to this author to be a nicely-sheared and citified front-attachment to a country home, but to include the whole surroundings of the house. He would have the rear fully as beautiful as the front, and he would exclude from every homestead those parts which are generally given over to waste and rubbish. He does not, however, sufficiently exclude that fussing with lawns, which consists in perpetually digging out every little wild customer that nature insists on sowing where we have put selected grass seeds. Nor is he quite ready to let go of some of the old hobbies, such as rockeries and artificial development of natural slopes. The chapter on "Grandmother's Garden" is delicious. Unlike modern gardens, this old-fashioned garden was not created for show alone, but was a real storehouse of color and odor, out of which one could, day after day, gather rich treasures. Where shall we find now such beds of pinks and sweet williams? Great hollyhocks were there, too, with richly colored single petals—and there were tulips without stint. The nasturtium, however, was relegated by our mothers to the vegetable garden. There its seeds were daily plucked, to stuff mangoes or to fill deliciously scented pickle jars. Mr. Parsons gives us a brief chapter on city parks, another on railway lawns, and another on the church yard. All of these are compact, suggestive, and would bear enlargement as monographs if the author desired.

The Great Adventurer. By Robert Shackleton. New York: Doubleday, Page & Company, $1.50.

The most that can be said for *The Great Adventurer* is that it is evidently written with a sincere purpose, and that some solid truth is told in the course of it. A judicious selection of extracts from its pages would make a very good pamphlet on the evil effects of trusts. In a novel, however, other things are needed. It is curious, by the way, that fiction dealing with the struggle between capital and labor is almost always lacking in artistic merit, in naturalness, in most of the qualities that go to make a good story. Even Zola's pen lost its cunning when he wrote *Labor*. And yet, after all, this is not curious, for any one who studies these topics is pretty sure to form strong partisan opinions, and partisan opinions have a dampening effect upon the divine creative fire. As for

The Great Adventurer, the scheme, in the first place, is too ambitious, and the plot cumbersome. The author has sought to show the logical conclusion of the trust system by picturing how one Newbury Linn, financial genius, unites all existing trusts in one great overshadowing combination, controlling all the business interests of the country. The method by which the reader is convinced of the vastness of this trust is one which consists chiefly in adjectives. "The great Trust loomed monstrous, portentous, threatening." . . . "Newbury Linn, silent, strong, imperious, animated by splendid ambition" . . . "Impassive, imperturbable, self-contained, monosyllabic, he sat at the desk." It does not take very much of this kind of thing to make you feel as if little hammers were playing on your brain. Toward the end of the book the great trust is dissolved by Newbury Linn himself, who sees the harm and misery it is causing, and experiences a change of heart. We never heard, in real life, of a financial magnate of that type having a change of heart; but it may be possible. The conversation in *The Great Adventurer* is ponderous, and the love interest is of a like quality, and all in all one puts down the book with the feeling that again has a good *motif* been wasted. The trust, as it flourishes in this country, is one of the most dramatic developments of modern life, in its every aspect it is overflowing with literary material, and if ever a novelist arises who can employ this material with a due sense of its artistic value, and without preaching, he will stand a fair chance of producing "the great American novel." So far H. G. Wells, in "When the Sleeper Wakes," has made the most artistic use of the dangers of an all absorbing trust.

The Price of Youth. By Margery Williams. New York: The Macmillan Company, $1.50.

This book may be somewhat crude in style; the diction is often careless; but it has a certain blunt vigor which makes one overlook these faults. They are manifestly the faults of youth, for the story is full of the feel of youth and of racing blood. The scene is narrow enough—a little New Jersey village, petty, gossip loving, thoroughly commonplace. Against this background the figure of Fan Tasker, the heroine, stands out vividly. She is more like a boy than a girl in many ways, keen, virile, recklessly and contemptuously indifferent to village opinion; but a good girl, with the making of a good wife in her. That she is good is rather remarkable, for her father, who keeps the town bar, is a man of more than doubtful morals, and Fan lives in the hotel behind the bar, waiting on an occasional boarder, and enduring the presence of a woman whom her father keeps there in defiance of established standards. One of the boarders who comes is a young newspaper man from the city, and he and Fan drift into comradeship and later into love. Yet you feel from the first that he is going to fail her. Village gossip comes to his ears, gossip which she has provoked, no doubt, tho her escapades have been no more than the "revolt of unchecked youth against the monotony of her surroundings." Were he a man he would trust in the loyalty that underlies her rashness, but instead he listens to the gossip. What makes the story noticeable in its modest way is the uncompromising directness with which it probes under the surface of things, and its manner of picturing the little piece of life with which it deals. What is common and vulgar in the life is shown without the slightest touch of glamour; and verity, after all, is a more valuable quality in a novel than finish of style—if one cannot have both.

The Psalms in Human Life. By Rowland E. Prothero New York: E. P. Dutton & Co., $3.50 net.

Next to the Gospels, the Psalms are the best known portion of the Bible, and it is probable that some of the Psalms excel even the Gospel story in hold upon the heart. In addition to the excellence of the Psalms for private devotion, the liturgical use of the Psalter in many Churches does much to preserve their popularity. Every one must have a general impression that the Psalms have been quoted often at important crises in men's lives, and have served to give expression to feeling at memorable scenes in history. Mr. Prothero has collected "some of the countless instances in which

the Psalms have guided, controlled and sustained the lives of men and women in all ages of human history, and at all crises of their fate." He has collected notes during many years with much diligence and patience, and the list of works from which he has drawn his material occupies 18 pages. He has arranged the references thus gathered by chronological periods, but a complete index enables one to trace all the references to any particular Psalm. The volume is of much value to any one who has occasion to use the Psalter, and will interest all who are interested in the Psalms. For the most part the incidents related are of real interest and importance, tho sometimes the part played by the Psalter quotation does not seem to be important, and occasionally the pertinence of the actor's use of the Psalter may be questioned, as on p. 365: "'Quaker Wallace,' of the ninety-third regiment, plunged into the Secundarabagh like one of the Furies, quoting a line at every shot fired from his rifle, and at each thrust given by his bayonet:

"I'll of salvation take the cup,
On God's name will I call;
I'll pay my vows now to the Lord
Before his people all."

Perhaps it would have been better to have omitted President Kruger's proof from the Psalter that the Boers would win against Great Britain. However, the wealth of material is so great, the number of pertinent and valuable references is so large, and the matter is so well arranged and indexed, that the work as a whole is to be commended.

The Voice of the River. By Olive Katharine Parr. New York: E P. Dutton & Co. $1.25.

This is a very young book, written by a presumably very young person, who modestly confesses on the fly leaf to having already published "Poems." The characters portrayed are two English children on a "River" with a "Voice" that gossips its way through the tors and goyals of Dartmoor. The tales the River tells compose the volume,—a daring conceit, but well sustained by a remarkable simplicity. As we grow older we forget the innumerable small realities, the natural things, that filled our earliest years with innocent joys and excitement; but in this book they are all remembered and set down in a pretty ballad style refreshing to those among us who have wandered "far inland" from the happy shores of childhood; and it is, therefore, very appropriately dedicated "To all children, whether big or little."

Sylvia's Husband. By Mrs. Burton Harrison. New York: D Appleton & Co.

The persons who figure in this novel are members of an English house party who "carry on" more or less scandalously. One does not know whether to blame the author or the state of British society; but certainly it is a snobbish tale of snobbish people, and it is a matter for conjecture where a Virginia woman of Mrs. Harrison's distinction became so intimately acquainted with the types she portrays. They are so unrespectable. And if this is a sample of the "Novelettes de Luxe" series now being issued by the Appletons, we have only to say that the foolish gilt and tinsel life displayed in them will appeal especially to chorus girls and other pathetic creatures of that kind among us.

The Nature of Goodness. By George H. Palmer. Houghton, Mifflin & Co., $1.10.

This is a very winning and suggestive study in ethics. The author has had the benefit of the criticisms of audiences at a number of colleges, and he acknowledges his indebtedness to them. Self-consciousness, self-direction, self-development, self-sacrifice,—these are the traits in which the real ground of difference between person and thing is to be found. These traits are subtly analyzed and explained, and from the analysis two antithetic worlds emerge, a world of nature and of spirit, the former guided by blind forces, the latter self-managed. The contrasts and relations between these worlds are drawn out with admirable insight, and many difficulties are solved by the doctrine of three stages of goodness. This treatment of the perennial problems of ethics is thoroughly refined and elevated.

Editorials

Opening the Exposition

It has taken six years to prepare the Exposition which commemorates what happened a hundred years ago. A hundred years is a short period in human history for such a marvelous accomplishment as the century has shown since Jefferson stretched to the breaking point the strict authority the Constitution gave him, and he dared to purchase of France the Western side of the Continent watered by the Mississippi, to be enlarged later by acquisition from Mexico. Long might the new Territory have remained forest and bare prairie but for two mighty influences. One of these was the invention and development of steam travel by water and land, which made distant regions easily accessible; and the other was the new and fascinating exhibit and experience of liberty which our nation offered to the people of the hard-ruled Old World. So now fifteen million people inhabit the mountains and valleys for which we paid fifteen million dollars, and fourteen populous States and Territories show solid local governments having part in National government, where France gave over to us herds of buffalo and cities of prairie dogs.

No event in our history, since the Declaration of Independence, celebrated so worthily in Philadelphia in 1876, so deserves local celebration on national lines as does the Louisiana Purchase. And worthily is that great act honored with the help of generous grants from the National and the State Government. It will be, we believe, the most complete and grandest Exposition ever held on either Continent. It opens, as all Expositions have opened, unfinished, but yet nearer a full installation than those that have gone before. Architects and landscape engineers and exhibitors and directors have combined their genius to show the best product that can instruct and stimulate the millions that will visit it. We earnestly advise all who possibly can to take some days to see and study this great Exposition. It will teach them much to do and have for their own homes, and it will fill their minds with long memories of useful hours.

The first Centennial Exposition was of immense value to our people for the lesson it taught of art to be added to utility. We then learned something of what Europe could teach us, for the best of Europe was thus first brought to our eyes, and we could compare what we had done that was coarse and crude and strong with what the older nations were doing that was also beautiful. It made a revolution in our industries, and yet we do not forget that from that Centennial we also date an invention, that of the telephone, which has revolutionized the world's business and comfort. The Buffalo Exposition will be remembered for what it taught us of the possibilities of decorative architecture, and of grand sculpture; and parks and plazas in a hundred cities are made beautiful by the lessons of the Court of Honor. What this Exposition will teach us we cannot yet tell; perhaps its chief lesson will be for the fourteen commonwealths whose creation its celebrates.

Yet one thing further we know. It appears coincidently with a great change in the policy of our Government. A hundred years ago we purchased Louisiana and turned our vision to the Pacific. Now we look across the Pacific, from our new observatory of the Western Sierras, and with confidence attack our new problem of far Eastern colonies, and watch with concern the struggle of the nations for control of the most ancient and populous empire of the world. We accept Secretary Taft's confidence, expressed in his speech in behalf of the President, that our nation will solve that problem well. We are not quite sure, with him, that the Philippines will never become States in this Union. "Never" is a word that looks long ahead, and

overlooks many possibilities of progress. We remember that before the days of railroads Daniel Webster was sure that Oregon could never become a State, because no elected representative could reach the Capitol before Congress should adjourn. But if the Philippines shall never receive admission as full States, the alternative must certainly be at least as much independence as Canada and Australia enjoy. The problem opens with this Exposition. The beginning of the next century will probably show a vaster May-day Exposition in Manila.

A word for Mr. Stedman's stately opening hymn. Lanier's Cantata of 1876 called forth many criticisms from those who failed to solve its significance. And yet it uttered plainly the response of Heaven to Columbia's questionings:

"Long as thine Art shall love true love,
Long as thy Science truth shall know,
Long as thine Eagle harms no Dove,
Long as thy Law by law shall grow,
Long as thy God is God above,
Thy brother every man below,
So long, dear Land of all my love,
Thy name shall shine, thy fame shall grow."

Stedman's song is framed in strong and simple phrase which all can understand. It utters naturally the deep worship which our people pay to the Divine Power on which they depend, the Power which

"empire unto Freedom gave,
From cloudland hight to tropic wave."

It concludes with a reference to the elements from all nations that have entered into the population of the added Territory:

"Thou, whose high archways shine most clear
Above the plenteous Western plain,
Thine ancient tribes from round the sphere
To breathe its quickening air are fain;
And smiles the sun
To see made one
Their brood throughout Earth's greenest space,
Land of the new and lordlier race."

That word "lordlier" may strike a doubtful note, as does the "lesser breeds" in Kipling's "Recessional." But we are so used to that assumption of superiority that we hardly notice its expression, and it has to be forgiven.

Save a little, sacrifice a little, but see the Louisiana Purchase Exposition.

Congress and the Issues

It was a short session because the Republican majority could see no political advantage to be gained by making it a long one. Indeed, from the Republican party's point of view there was probably something to be lost by deferring adjournment until the first or the middle of June. Controlling all branches of the Government, the party was of necessity on the defensive in the closing weeks of a session immediately preceding the national nominating conventions. It had not much to fear in the Senate, but it might expect to lose some votes by reason of the Opposition's attacks in the House, where a keen, judicious and well-equipped Democratic leader had arisen. Moreover, there were measures pending, in or out of committee—among these the labor bills—upon which it preferred to postpone action until after the election.

Outside of the great supply bills, there was little of prominence or importance in the session's work, except the action of one house, or of both houses, upon propositions originating with the Executive. Inevitably, therefore, the personality and the force of Mr. Roosevelt were continually before Congress and the American people. The greatest of these propositions were the treaty of reciprocity with Cuba; the Panama Canal treaty and all that came in its train; the treaty with China for open ports in Manchuria. With these were others, coming from the Government but not originating in Mr. Roosevelt's term, altho they were pressed forward by him—such as the Platt Amendment treaty, and the agreement for naval stations on the Cuban coast. The prominence thus given to the President did not indicate that he sought to control the action of Congress. By the force of circumstances, and because he promptly took advantage of opportunities for accomplishing something in behalf of the American people, he was a leader. When Congress sought to oppose his leadership, as in the case of the treaty of reciprocity with Cuba, it was wrong. He persisted, as it was his duty to persist, and Congress at last admitted the justice of his cause.

It is partly on account of this natural and necessary relation between Mr. Roosevelt and the action taken at the recent session—a relation which is shown

also with respect to legislation concerning the army, the navy and the Philippine Islands—that his personality will be an issue in the campaign. Because it will be an issue his political opponents ransacked his published books and the entire history of his public life for material to be spread upon the pages of the *Congressional Record*, and thereafter to be circulated in the form of campaign documents. Looking at his relation to the legislation of the session from the point of view of the politician, we cannot see that it has been injurious to his candidacy or harmful to the interests of his party.

Nothing was gained for the Democrats by their opposition in the Senate to the Panama Canal policy of the Government. They suffered by reason of wretched leadership. Mr. Gorman might well have taken lessons from Mr. Williams in the House. The acquiescent vote of almost exactly half of the Democratic Senators buried that question as an issue for the campaign. We believe that if the Government's Panama Canal policy could now be submitted to the country by itself, associated in no way with political questions, it would be approved by at least three-fourths of the voters.

So far as the demands of organized labor are concerned, the dominant party is not committed by the passage or the rejection of the pending bills. The President is committed to the "open shop" in the Government service. As a just man and the chief magistrate he could take no other position. His record in the Miller case is one that his party can well afford to support. His intervention to procure peace and arbitration at the anthracite coal mines should commend him to workingmen, in or out of unions, and to the public.

It is well known that the session's legislation concerning the Philippines was more narrow and restrictive than the President and his Secretary of War desired it to be. But neither their attitude nor that of the majority in Congress permits the raising of a distinct issue on this subject in the campaign. At their convention last week the Democrats of New Hampshire placed the following paragraph in their platform:

"While the flag, when displayed by competent authority, should always have honor, it is our duty, so soon as their enlightenment and conditions will permit, to give autonomy and self-government to those lands and peoples under our control."

Mr. Roosevelt and Secretary Taft would subscribe to that. If Democratic platforms are to be made in this way, questions relating to the Philippines will have very little or no weight in the campaign. Militarism must be laid aside with them.

In the record of the session there is no legislation affecting Trust corporations, altho the Trusts were by no means forgotten or ignored. Bearing in mind all that was said, the resolutions of inquiry that were passed, the answers of Mr. Knox, and the decisions of the Supreme Court, we think that on this issue, from the point of view of practical politics, the Government's losses slightly outweigh its gains. It has to its credit the merger suit and decision, its continuing injunctions against the Beef Companies and certain railroads, and the provision for publicity in the Bureau of Corporations. On the other hand, its failure to enforce the criminal provisions of the Sherman law, and the failure to renew the original suggestion of the Department of Justice for legislation to make the law effective against combinations of manufacturers, together with Mr. Knox's disingenuous and misleading reply to the resolution concerning the coal railroads, have made an unfavorable impression in some minds. It is quite probable that the deep and general interest of the people in the Trust question, especially as it is related to the tariff, is not clearly perceived at Washington.

It was on the 27th ult. that Mr. Littlefield (Republican), of Maine, in the course of a long speech said that tariff duties should not be imposed to enable a corporation having an actual capital of $100,000 to declare dividends upon an inflated capital of $1,000,000. He also said:

"Wherever a manufacturer or a producer is able to sell his product abroad cheaper than at home, by reason of the operation of a tariff, I believe that the tariff should be so reduced as to prevent this. I believe that to be the policy of the Republican party. I would deprive such a manufacturer of so much of his protection as it would be necessary to take away in order that the sale at cheaper prices abroad might be prevented. I do not know of any Republican that takes the other ground."

But if the Republicans of the House and Senate had really been in agreement with Mr. Littlefield at the recent session, they would have revised the tariff. High duties that permit such discrimination as he condemned are a weak spot in the Republican armor. There is a risk in "standing pat" on them, unless the Opposition is crippled by factional wrangling and division.

The Proposed Presbyterian Union

We spoke recently of Church union as suggested—not yet seriously proposed—between the Baptists and Congregationalists, a union which ought to be actually proposed, as there is absolutely no serious bar in the way, nothing beyond the old custom of remaining apart. This week we speak of a union more than proposed, actually negotiated, and to be acted upon in a very few weeks, between the Northern branch of the Presbyterian Church and the Cumberland Presbyterians.

Committees appointed by the General Assemblies of these two denominations have proposed a plan of union by which they shall become one body. The plan will be considered by the General Assemblies in May, and, if approved, it will be sent down to the presbyteries for adoption or rejection. This is not the first time the Cumberland Church, with its two thousand ministers, has considered the question of union. In 1867 there were negotiations with the Southern Presbyterians, but no union was possible. The Southern Church insisted that there could be no union except on the unaltered standards, while the Cumberland Church would have union only on condition that the Westminster Confession was revised to their taste. It never occurred to either that they could agree to differ. In 1873 a similar conference with the Northern Presbyterian Church was equally abortive.

Now the Northern Presbyterians have revised their Confession and made a new and short creed, and there ought to be no doctrinal bar to union. This is the proposal, the entire basis of union:

"The union shall be effected on the doctrinal basis of the Presbyterian Church in the United States of America [Northern Presbyterian], as revised in 1903, and of its other doctrinal and ecclesiastical standards; and the Scriptures of the Old and New Testaments shall be acknowledged as the inspired Word of God, the only infallible rule of faith and practice."

We have said that this is the entire basis of union, but yet there is a little string attached to it, in the way of a recommendation or two, without which the proposed union will not become operative. Of one of these we will speak later.

One would think there could be none found to object to this basis of union. But such are found. Princeton, speaking through *The Princeton Theological Review,* opposes union now, as it opposed the union of the Old and New School Churches. Two articles in the April number of the *Review* are devoted to this attack. One is by Edward B. Hodge, D.D., Secretary of the Presbyterian Board of Education, and shows the hopeless Arminianism of the Cumberland Church: the other is by Dr. B. B. Warfield, Professor of Systematic and Polemic—why not Irenic?—Theology in Princeton Seminary, and is such an outspoken polemic against union as justifies his holding his professorship. His whole argument depends on a postulate, assumed as an axiom, which is absolutely false. It is thus expressed by him:

"Unity of faith between them and us is the indispensable prerequisite of union."

Certainly this is not true. Unity of faith may be the condition and prerequisite of stagnation and intellectual death, but not of union. Differences make the life of union. Why should not differences of theologic creed be as possible in the Church as differences of political creed are in the nation? Our country has no political creed; it has only what Presbyterians call a Form of Government, a Constitution. As to political creed our people differ; every convention makes a new one; a man may be a citizen, as in France, altho he believes in a monarchy. The only hopeful plan of union between denominations is that in which freedom to differ in creed is allowed. This was what made union possible between the Old and the New School Presbyterians. But how can a professor of Polemic Theology be expected to admit such a principle?

Were this all, the question of union ought to be a simple one for the two General Assemblies and the Presbyteries; but we have said that there is a string attached to it in the way of recommendations, and without the adoption of the recommendations union will not be valid. Only one of these is of any importance, and that is this, that permision be allowed —we give the meaning, not the circumlocution—to draw the race line in presbyteries and synods when one race desires it. What is proposed is union by division. The Cumberland Presbyterian Church has separate presbyteries and synods for negroes; the Northern Presbyterian Church has always refused to draw the caste line. The Northern Church is asked to accept the Southern prejudice on this matter, and the Committee of Conference between the two bodies has approved the plan. They justify it on the ground of peace and expediency, and they remind us that there is precedent for it in the organization of one or two Northern presbyteries. There is a presbytery in the Synod of South Dakota called in the Minutes "Presbytery of Dakota, Indian," in which there are twenty-two ministers and twenty-seven churches, mostly Indian, but part white, and which possibly transgresses some territory covered by another presbytery. The argument is that if we can have an Indian, and might have a Welsh or Bohemian presbytery, we may equally have separate presbyteries and synods for white people and negroes.

The answer is, that this is no precedent. The necessity for an Indian presbytery is confessedly temporary, while its members talk the Dakota language and do not understand English. Yet even so, white and red ministers and elders are in the same presbyteries. The case is utterly different if certain Presbyterian Christians are to be told that they are an inferior class, not fit to meet on equal terms in conference with the superior class. There is no pretense that this proposed separation is intended to please the negro; it is to placate the white prejudice in certain sections. The negroes want no new line drawn against them. They are proud of their position in the Northern Church, and the Northern Church has firmly held to the Christian position when some other Churches have faltered. The question for the Northern General Assembly to answer is, whether it will approve this union at the expense of humiliating ten or twenty thousand of its members. Is it ready to crowd out its own brethren for the sake of placating the prejudices of its new-comers? For the sake of a compromise on Calvinism will it sacrifice its Christianity? And then will the Moderator offer a prayer of thanksgiving, and the Assembly sing the doxology grateful that grace has been given them to unite in kicking the negro down stairs? Perhaps so, the committee recommends it; but as Massachusetts and Rhode Island are ashamed that their ancestors held slaves and engaged in the slave trade, and as the old slave States are on the road to that same shame, and already declare that they would not restore slavery if they could, so, not many years hence, it will be a long memory of deep shame if the Presbyterian Church shall take one step backward in the recognition of the brotherhood of men in the Church of Christ. Will it be less Christian than the Episcopal Church, which would scorn the suggestion of race dioceses?

Popular Government; 1904

NINETY-NINE good men and true in every one hundred American citizens think that they know all that is worth knowing about popular government. What they don't know about it they can learn in fifteen minutes by reading Eltweed Pomeroy's article in this number of THE INDEPENDENT.

A story is told of a landlubber Secretary of the Navy, brought up in the Middle West, who, after taking his oath of office, as a matter of conscience, journeyed to the seashore and went on board an ocean-going craft to see what it was like. Gazing down an open hatchway, he exclaimed: "By ——, the —— thing is hollow." We fear that more than one reader of Mr. Pomeroy's experiences as an insider on the American ship of state will mournfully infer that it is hollow.

That in many parts of the South and in many wards of the great cities of the North the sovereign people has nothing whatever to say about the actual "running" of politics has, of course, long been well known. But that the actual

conduct of primaries and conventions in the most respectable of smaller Northern towns is managed by the bosses without so much as a semblance of fair play, and with all the devices of ballot-box stuffing, counting out and actual personal violence where necessary, will be, we imagine, a revelation to most of our readers.

When we are told that in Mexico the voter never votes, and that an election consists in sending an officer to bring half a dozen electors to the polls so that the form of ballot-casting may be complied with, and that a return is then made to the Government of a majority of a certain figure for a certain candidate, which the Government has in advance instructed the election officers to send in, we think that nominal popular government, in our neighboring republic, is not unlike a dictatorship. If any New Jersey Democrat can explain wherein Democratic politics in that commonwealth are essentially different from the Mexican system, his demonstration will be an important contribution to comparative political science.

Is it possible to discover the causes or to dictate the remedies for a state of things so disgraceful? The obvious truth that primaries and conventions have been captured by the political machine, because only a few electors ever take the time and trouble to attend the caucus, is only a superficial account of the matter. What is the reason of such indifference, and is there any cure for it, or way of counteracting its evil consequence?

The commonly accepted view is that good citizens stay away from primaries partly because of selfish unwillingness to make necessary sacrifices, and partly because of unpleasant experiences with the practical politician. In our judgment this view misses the real difficulty. This is an age in which all men that are good for something are legitimately busy, and have many pressing duties to fulfil. It is, therefore, an age of specialization and of delegated powers. In business matters men learn how to get things done for them, and done right. If we are to have the reality of popular government, we shall have to learn how, while getting much political work done for us, to get it also done right. There is a legitimate function for the practical politician, for the man who makes it his business to do the hard work—and there is a lot of it to be done—preliminary to elections. The problem is to get him to do it for the people and not solely for himself, or for corrupt interests.

Of course, if the politicians are to be held to a straightforward performance of this legitimate political function the people must, after all, do a certain amount of initial work, and we hold it to be certain that they will not do it through attendance at numerous primary meetings or conventions. This process has become uneconomical. It is wasteful of the time and strength of busy men. Time was when public opinion was created in public meetings. It is no longer created in that way, because an economical substitute has been found. Instead of spending hours in attending meetings for the purpose of finding out what we think about questions of public policy, we read the newspapers, day by day. So informing ourselves of facts and theories, and thinking them over at our leisure, we arrive deliberately at our conclusions. A way that shall be essentially a newspaper way of determining the candidates of the people for public office must be found. There need be no fear that the politicians will fail to nominate the men that are the real popular choice, if once that choice is unmistakably made known.

We do not undertake to say just how the thing can be done. A systematizing of the postal card canvass, which newspapers have invented for forecasting election results, is one possibility. A preliminary suggestion of names by editors and contributors would result in a concentration of postal card votes on a comparatively few candidates on the first trial. A second canvass would usually result in a massing of popular support that the politicians would not dare to ignore.

A better method than this may very likely be thought of, but in one way or another a plan economical of time and energy must be devised, if we are to have the reality of popular nomination, as well as of popular election. The primary, as a workable device, has had its day. To scold and preach at busy men because they will not attend it is a silly waste of breath.

Birds and the Farmer

RECENT study of birds has put them in quite a new light in relation to the farmer and his crops. It is clearly established that a fruit grower or a gardener cannot expect to combat successfully with his insect rivals without the help of his winged allies. The more we improve our agricultural methods and multiply our garden crops the more we stimulate the development of pestiferous insects. A recent writer says:

"We believe that not only is the success of our farmers dependent upon the help of the birds, but we believe that without them man would have to vacate the land. The robins, the sparrows, the grosbeaks and most of the thrushes destroy vast quantities of pests, while the goldfinches and other seed-eaters are of almost equal use in destroying the seeds of noxious weeds. The swifts and the night hawks, who sweep the air of moths and troublesome insects, are of equally fixed value."

This is to look at the economic side alone. It omits the very just estimate of the value of birds to our intellectual life. It is true now if it ever was that man cannot live by bread alone. The finest and highest relations of music to everyday life are found in the morning concerts of the bird tribes. Starting at the Atlantic shore, the wave of robin song rolls westward until it touches the Pacific.

Bird culture must become a systematic scheme throughout our agricultural States, to encourage the multiplication of those varieties that are most helpful. This, after all, will not prove to be a difficult matter. A Tartarian honeysuckle hedge will pay a farmer or fruit grower simply as a windbreak. It will also be a decided advantage to a country home purely from the esthetic standpoint. But just as your raspberries ripen and your cherries are in tempting condition for the birds the hedge will be loaded with berries that are more attractive to the robins and catbirds than your valuable raspberries and strawberries. The high bush cranberry is equally valuable in late autumn and throughout the winter, attracting the cedar birds and pine grosbeaks. These birds are half the time at work grubbing around among your trees, and their song is well worth paying for. All of the wild cherries make valuable trees for bird food, the little red-fruited chokeberry being much liked by the robin. Planted along our fence lines they give abundance of food and draw the birds away from our Gov. Woods and Bigarreaus.

The Department of Agriculture has a special bulletin, in which it calls attention to the fact that ninety per cent. of existing legislation is in behalf of game birds, instead of song birds; yet the latter make up more than eighty per cent. of our most useful visitors. It happens that those birds which we most desire to multiply in the Northern States are slaughtered for food during the winter while in their Southern retreats. Among these are the bobolinks, the horned lark, song sparrow, bullfinch and robin. Besides these, not a few of our wood thrushes, catbirds, scarlet tanagers and vireos fall into the hands of the cooks in our Gulf States. It is desired that legislation be broadened out so that our songsters can be as sure of a safe retreat as the game birds, and return safely to us each spring.

Professor Beal, of Michigan, tells us that if we wish to protect strawberries and cherries we should plant more of the Russian mulberry and our native shadberry, and to protect raspberries and blackberies in July and August he recommends the elderberry and the choke cherry. In September and October those birds which meddle with peaches and grapes are fond of the Virginia creeper, and this can be easily cultivated to cover old stumps and stone fences. He adds that a supply of winter food should include mountain-ash berries, viburnum, poke-berry, barberry, hackberry and dogwood. Professor Forbush, of Massachusetts, says:

"I wish particularly to note that the mulberry trees, which ripen their berries in June, are a protection to the cultivated cherry—as the fruit-eating birds prefer them."

It is quite important, so far as possible, to keep insect eating birds with us and at work all winter. This can be easily done if our farmers' daughters will hang out lumps of suet in the vines and trees about their houses. A plenty of food being furnished, the nut-hatches, the chickadees, the purple finches and the woodpeckers will be easily kept in force every day of the winter. Mrs. Davenport, of Vermont, enumerates among those which

she keeps with her all of the year nuthatches, song sparrows, linnets, juncoes, robins, blue jays and even orioles. She feeds these with hemp seed, cracked corn, sunflower seed, bread crumbs and a bread made of one-third wheat and two-thirds Indian meal. All the brighter days of winter these birds will be assiduously hunting insect eggs and cocoons among your trees. This is one of the most important subjects that the farmer can consider, as the necessity for bird alliance is growing upon us every year.

The Open Shop in the Clothing Industry

THE "open" or "closed" shop question has within the past few weeks reached a crisis in the clothing industry, and in no other industry could it have come before the public in a shape more favorable to the side of the union. The National Association of Clothiers, at their meeting in Philadelphia, adopted the following resolution and provided for a National Labor Bureau to carry it into effect:

> "The closed shop is an un-American institution; the right of every man to sell his labor as he sees fit and the freedom of every member to hire such labor are given by the laws of the land, and may not be affected by affiliation or non-affiliation with any organization whatever."

This resolution, on its face, is very fine and patriotic, but it lacks the sense of humor. The ready-made clothing industry in the past twenty years has fallen almost wholly into the hands of the Jews. The manufacturers are mainly German-American Jews, while the workmen are Russian Jews. Until three to five years ago clothing was manufactured by the sweating system—*i.e.*, a system in which the manufacturer escaped responsibility for the conditions of his workmen by letting out his work to small contractors or "sweaters," who, in bidding against each other for contracts, forced down the wages and lengthened the hours to the exhaustion point. These contractors, like the workmen, were also Russian Jews, working along with the men and women whom they hired, and earning scarcely more than their skilled workmen. Thus the German Jews set the Russian Jews into a cutthroat competition among themselves. They were able to do it through the enomous immigration of necessitous Russian Jews.

Finally the Italians began to come into the trade, and the contractors began to play the Italian against the Jew. No matter how hard, long and cheap the Jew will work, the Italian will go further. The Russian Jew does not permit his wife to work, he educates his children, he observes sanitary rules and carries on a vigorous intellectual life. The South Italian gladly accepts the wages of wife and children, and has but few of the higher wants of the Jew. Against this threatening displacement by Italians and newly arrived Russian Jews the Jews who had been longer in this country organized their unions. They compelled the manufacturers to eliminate the contractor and the sweating system; they reduced the hours to 54 per week, and raised the wages twenty per cent., and reduced their speed to a hygienic standard. Most essential of all, they compelled the adoption of the closed shop, which simply means that the Jews already in the trade, in order to maintain their standards of wages and living, are trying to keep the cheapest of the Italians and the newly arrived Russians out of the clothing trade. On the other hand, the open shop simply means that the German Jew as a manufacturer has the opportunity to displace the Russian Jew with the cheaper Italian.

This is exactly what is being done in another branch of the ready-made clothing industry controlled by the Jews, that of women's garments. Here there is almost no organization of workmen, and already in New York City one-third of the workmen are Italians, the hours of labor are 15 to 16 per day, and wages for men are as low as $5 per week. No wonder that the Russian Jews working on men's and boys' garments are determined to fight for the closed shop when they see the meaning of the open shop on women's garments.

These facts, cold and unvarnished, show how lacking in the sense of humor are the Jewish manufacturers when they proclaim the closed shop as "un-American." It is amusing to hear the Russian Jew denounced as un-American for trying to protect his Americanized standards

against Italian immigrants. And it is still more ludicrous when we remember that this Jewish manufacturer, who floats the banner of Americanism, is himself protected by a tariff of 50 per cent. to 100 per cent. on ready-made clothing brought in from Europe. The Jewish workman, when he establishes the closed shop, is protecting himself against the pauper labor of Europe, but the Jewish manufacturer is protected by the laws of the American people. It would seem that if the closed shop in the clothing trade by which workmen protect themselves is un-American, then the prohibitive tariff by which a paternal government protects the employer is also un-American. At any rate, it is absurd and inconsistent with the American system of protection that manufacturers, who enjoy a closed market against the cheap products of Europe, should demand an open shop to admit the cheap labor of Europe.

The Methodist Standards

In the trial of Professor Bowne for heresy the first step in the proceedings was the admission on both sides that "the doctrinal standards of Methodism were acknowledged to be, the Articles of Religion, fifty-three sermons of John Wesley and Wesley's "Notes on the New Testament." What it will be impossible to make other people understand, and it will be impossible one day to make Methodists understand, is why fifty-three sermons of John Wesley should any more be made standards on which a man can be tried for heresy than as many sermons of Dr. Buckley; or why Wesley's "Notes on the New Testament" are any better inspired or any truer than Dr. Whedon's or why the Twenty-five Articles of the Methodist Church deserve any more submission than the Episcopal Thirty-nine Articles, except that they are fewer. One of the truest utterances that ever entered into a creed is found in the Westminster Confession of Faith and thus reads:

"All synods and councils, since the Apostolic times, whether general or particular, may err, and many have erred; therefore, they are not to be made the rule of faith or practice, but to be used as a help in both."

What is true of these larger and smaller synods and councils is true, therefore, of the Articles they have promulgated. If there must be trials for heresy, the standards should not be any pronouncements of a hundred or a thousand years ago, but the best judgment of men to-day. We would rather trust the soundness of the New York East Conference than that of dead John Wesley and all the sainted tombs about him.

Mexicans and Italians

See how it grows! We take the following facts from the Dallas, Tex., *News:* The Burlesen County Democratic Executive Committee at its meeting April 9th voted that at the primary election for the nomination of all officers the test for voters be in these words:

"I am a white man, and pledge myself to vote for the nominees of this primary."

It was also voted that the words "white man" be interpreted to exclude all Mexicans and Italians. The Democratic Executive Committee in Caldwell County met April 8th and passed the same vote for a white Democratic primary, with the same interpretation. Of course, Mexicans and Italians are "white." This seems to be a concerted policy, and it may have important political results. It must drive "Mexicans," who are American citizens of Mexican origin or parentage, and Italians, also American citizens, as well as negroes, into the Republican Party, thereby strengthening it. It also draws a new race line. And yet some people will wonder why these people, excluded from the Democratic primaries, remain Republicans! They wonder why, when the door is shut, they remain outside. It is a further confession that it is not their color which shuts out the negro from his political rights. The principal plank of the Southern Democratic platform is "This is a white man's country," "white man" not meaning white, or Caucasian, but the present ruling political caste. We are informed that in Texas the feeling of unrest among those not "white" is growing. It ought to grow.

Teachers May Marry

We have repeatedly called attention to the injustice of the by-law of the New York City Board of Education which required the resignation of any woman teacher who married, and we are glad to note that the Board has at last abolished it. We should like to take the whole

credit for this, but we must confess that the recent decision of the Court of Appeals probably had more to do with it. The Board will discontinue its efforts to force the dismissal of the two women teachers who married in spite of the prohibition. This decision ought to have a good effect on the school boards in other places who have a prejudice against married teachers. Such a rule is an unwarranted interference with the right of the individual. It may work in any one of three different ways, but in all these cases its results are evil. It either causes the loss of an efficient teacher, or prevents from marrying a woman who might be a good wife and mother, or it leads to clandestine marriages. Which of these three is most injurious to the community is open to discussion.

Justice Brewer on Chinese Exclusion

Some thirty Chinese are to be deported as aliens, altho they claim to be American citizens, born in this country. They sought a writ of habeas corpus from the Supreme Court at Washington, but it was denied them. Two Justices vigorously dissented, and Justice Brewer said:

"The time has been when many young men from China came to our educational institutions to pursue their studies, when her commerce sought our shores and her people came to build our railroads, and China looked upon this country as her best friend. If all this be reversed and this, the most populous nation on earth, becomes the great antagonist of this republic, the careful student of history will recall the words of Scripture: 'They have sown the wind, and they shall reap the whirlwind,' and for the cause of such antagonism need look no further than the treatment accorded during the last twenty years by this country to the people of that nation."

Justice Brewer says no more than the solemn truth. It is such a warning as we offered last week. The present Chinese Ambassador was educated in this country; where are the Chinese youth studying here now to be future rulers of the Empire and lovers of America? They have been driven away by the Congressional blunderheads that listened to the Sand-lotters.

The man who wants the distinguished gentlemen admitted into 'Who's Who," with two others selected by each of them, to form a society something like the French Legion of Honor, and wear a button, has the idea that men of mark are not so modest that they would wish to keep quiet about their distinctions. While it is a fact that the proposition deserves all the ridicule it has received, we are not certain that true distinction is so very modest, and, as one writer says, "does not wish to carry a badge." Did our readers ever see a college commencement, with the President and professors in odd quatre-cornered hats, with purple, yellow and blue hoods, and Roman togas, for no other purpose except to show off their peculiar distinction? They are in "Who's Who," or expect to be.

The list of names of college professors and instructors given out as having signed a petition for Philippine independence looks imposing. For example, there are 16 names from Amherst College. We have taken pains to compare them with the list of professors and instructors in the last catalog, which gives 40 names. Of the 16 alleged signers, the names of 8 do not appear in the catalog, leaving 8 actual signers out of the 40 on the teaching staff, one in five.

Aërial navigation without balloons makes progress. Alexander Bell, with his box kites, is showing how it can be done before long, and Professor Langley, who has failed twice, reports that a Russian captain has just made a most successful ascent along the lines of the Langley aërodrome, the machine soaring like a bird and making sixty miles an hour. Very possibly our St. Louis Exposition will mark the beginning of travel by the flying machine.

An Irish Cardinal, an Archbishop and various other Irish dignitaries have signed an appeal to the Irish generally in this country, begging them to stop sending money over to bring their relatives to America. They are afraid that Ireland will be depopulated of the Irish race. The appeal is not likely to be very successful. If Irishmen, or Englishmen, or Italians can do better here, no Cardinal ought to stand in the way of their betterment, and Irishmen here will not.

Insurance

The Importance of Life Insurance

It would seem that the importance of life insurance had been so frequently demonstrated that nothing further along that line could possibly be presented. And yet many men with a full realization of what it signifies to those dependent upon them to be without the protection afforded by life insurance continue to put off obtaining such insurance which they know they ought to have. Day passes into day and they continue uninsured. Death lurks in the pot, it stalks abroad in the land; friends and business associates fall before it; and still they halt before insuring themselves against the certainty of dying some day. The life insurance agent is treated with scant courtesy and many men meet death without having been insured. Procrastination is frequently the moving cause of non-insurance; and in the face of the uncertainty of life the importance of the procurement of a life insurance policy is here urged once more. It cannot be done too quickly.

Conflagration Hazards

The Baltimore, Rochester and Toronto conflagrations have compelled underwriters to consider how best to provide against conditions that recent experience has shown them may arise. The Executive Committee of the National Board of Fire Underwriters has appointed a sub-committee of twenty to study conflagration problems and to consider what action by the board would be advisable in view of conflagrations in the larger cities.

The work of this sub-committee has progressed far beyond the organization stage and a detailed survey of congested districts will be made in the near future.

Mr. Henry Evans, the Chairman, is President of the Continental Insurance Company. He has been exceedingly active in the work of the committee. In a recent interview he disclaimed the idea that the primary object of the movement inaugurated by the committee was rate-increasing. Its aims are far wider and much more comprehensive. They include the prevention of the construction of buildings that are referred to as "conflagration breeders," as well as the immediate improvement of the water supply and the efficiency of the fire department. To this end the support of the Federal Government will be sought for to minimize as far as possible the constant menace presented by the congested districts in large cities.

Endowment Insurance for Churches

Endowment life insurance has a growing popularity among Churches. In certain large cities parishes once largely residential have been persistently encroached upon by business to such an extent that down town churches in many cases have been deprived of a membership once prosperous and wealthy and left with no fixed congregation. In some cases of this kind more or less successful efforts have been made to supply the funds necessary to keep the Churches going by means of endowment policies. By means of endowment insurance Church members who are sincerely desirous of continuing Church work without regard to the individual minister in charge can provide against a doubtful future by the simple means of taking out insurance upon the pastor's life, for the benefit of the Church, and the money will become available just when the need of it is greatest.

Exhibit of Accident Ratios

President Dunham, of the Travelers, during a recent lecture delivered by him at Yale University gave his own company's accident experience in ratio form. The figures in question are exceedingly interesting. They are as follows:

	Per cent.
Accidents to pedestrians	24.14
At home (indoors)	18.80
Horses and vehicles	18.16
At home (outside)	15.98
Recreation	6.15
Railroad travel	4.77
Bicycle accidents	4.06
Street car travel	2.74
Use of firearms	1.73
Animal bites	1.52
Assaults	1.20
Steamship travel	.70
Miscellaneous	.05
Total	100.00

Financial

The Dumping of Steel

THERE was a conference, in London two weeks ago, of steel manufacturers from the United States, Germany, Austria, Belgium and Great Britain, but it seems to have come to nothing. The purpose of those who suggested it—said to be the members of the German Steel Syndicate—was to reach an agreement that should prevent "dumping." This would involve an understanding with respect to prices for export, and as to the defense of home markets. The chief difficulty that confronted the conference was a conflict of opinion in the British steel industry. British manufacturers who produce only crude forms of steel would naturally like to prevent the "dumping" of German and American billets or rods in their home market. But some other manufacturers, who must buy billets, or whose output of finished products is of much greater importance than their output of crude forms, enjoy this "dumping" because it gives them cheap raw material. It is said that the German steel makers consented that the proposed agreement should apply to Great Britain as well as to neutral markets, but that the British industry could not be controlled because it was not sufficiently consolidated.

What is this "dumping?" An official report of the German Association of manufacturers of wire rods shows that in six months the association's average price was £12½ per ton to German buyers, and only £7 to buyers in England and other foreign countries; the sale of 22,307 tons in Germany netting a profit of £58,856, while 19,524 tons were sold, or "dumped," abroad at a loss of more than £40,000. A year and a half ago, certain manufacturers in this country imported several thousand tons of German billets, paying 65 marks per ton. Our customs authorities decided that they must pay duties on a value of 95 marks, because that was the price in the German home market. But it was admitted that the German price for export, the "dumping" price, was only 65 marks.

Our own manufacturers, and especially the Steel Corporation, have been "dumping" steel rails, wire rods, nails and other products abroad—rails at $21.50 per ton in Canada, at $19 in Asia, and at similar prices elsewhere, while the uniform price at home has been $28. Years ago, our protected manufacturers of screws paid the Hon. Joseph Chamberlain's company £25,000 a year to prevent him from "dumping" screws here, and to enable them safely to exact a high combination price in the home market. "Dumping" by our manufacturers involves injustice to American buyers and consumers. In the approaching campaign we shall hear much about it, and about the tariff duties that permit combinations thus to discriminate against the people of their own country.

THE Chicago Pneumatic Tool Company, capital $7,500,000, nearly half of whose stock is held by Charles M. Schwab, has passed its dividend. It paid 6 per cent. last year.

....The exports of $12,800,000 in gold to Paris last week broke all weekly records. In one week of January, 1895, $7,700,000 was shipped, and in November, 1901, $7,329,000 was exported on one ship.

....The Steel Corporation has bought from the Crucible Steel Company the plant and outlying mines of the Clairton Steel Company, paying $1,000,000 and guaranteeing the Clairton Company's securities, which amount to about $13,000,000.

....The steel billet, sheet bar, structural steel and steel plate pools have decided to maintain the prices heretofore established. While the Steel Corporation is the dominant member of each of these combinations, they also include substantially all the other prominent manufacturers.

....Dividends and coupons announced:

Atch., Top. & Santa Fé R'way Co., No. 7 Common, $2.00 per share, payable June 1st.

Minn. & St. Louis R.R. Co., Consol. Mort., 5 per cent., payable May 1st.

Nassau Bank, 4 per cent., payable May 2d.

U. S Leather Co., Debenture Coupons, payable May 1st.

The Independent

Vol. LVI NEW YORK, THURSDAY, MAY 12, 1904 No. 2893

Survey of the World

Candidates for the Presidency

Judge Parker is still the leading candidate in the Democratic party, but recent events and expressions of opinion leave room for doubt as to his nomination. The opponents of Mr. Hearst in several States seem to prefer that anti-Hearst delegations shall not be instructed, in order that the question shall remain open. This unwillingness to follow promptly the action of the New York convention is due to the attitude of Tammany, the character of the New York platform, the prominence of ex-Senator Hill in the movement for Parker, the selection of a Sugar Trust millionaire for chairman of the New York committee, the bitter opposition of Mr. Bryan, and, possibly, to the intrigues of other candidates. Mr. Gorman permits it to be known that he thinks Judge Parker is losing strength, and that he would not be surprised if the convention should turn to ex-Senator Charles A. Towne, formerly of Minnesota, and now a Tammany man selling bonds in Wall Street. In Indiana, certain influential politicians upon whom ex-Senator Hill has relied for assistance, are saying that if Judge Parker's nomination is to cause Mr. Bryan and his followers to bolt, the Democrats of that State might regard with favor the candidacy of Mayor McClellan. A politician in Nebraska, who desired to be a delegate, says that Mr. Bryan asked him if he would stand by him (Bryan) in a bolt if it should come to that, and that he answered in the negative. The decision of the convention will probably be controlled by the uninstructed delegations, of which Pennsylvania's is the largest. In New York the withdrawal of James T. Woodward from the first place on the electors' ticket is still demanded by the Democratic *World* (which supports Judge Parker), in articles of which the following words are a sample:

"Was ever such imbecility, impertinence and insult to the intelligence of the people perpetrated by a party boss before? Is the State to be handed over to Roosevelt? Could the Albany convention have done anything more completely justifying Bryan's charge that Wall Street and predatory wealth are behind Hill?"

Mr. Hearst and his papers in New York and Chicago have been sued for libel by the New York *Times,* and also by the proprietor of the *Times,* Mr. Ochs, owing to articles in Mr. Hearst's papers designed to create a belief that the *Times* is owned and controlled by Mr. August Belmont and is employed to serve his personal and political interests. These suits grow out of the discussion of Mr. Hearst's candidacy and of the candidacy of Judge Parker, among whose supporters Mr. Belmont has had some prominence.—Mr. Hearst appears to have defeated Mayor Harrison in a contest for control of the delegates from Chicago. His friends assert that he will have a majority in the State convention. Iowa's 26 delegates have been instructed for Mr. Hearst by a vote of 515 to 371. The 10 delegates of Washington were not instructed, but it is said that 7 of them are for his nomination. He lost the delegates of the District of Columbia, who will probably support Mr. Gorman. In a stormy convention at Hartford, where contending politicians almost came to blows, and where the followers of Hearst denounced Parker as "a candidate of

silence, on a platform of evasion," the delegates of Connecticut were instructed for Parker by a vote of 366 to 186.—The continued suggestion that Speaker Cannon should be nominated for Vice-President has caused him to make the following statement for publication:

"Even at the risk of being accused of declining that which I probably could not get, if I desired it, I say most unequivocally that if the nomination were tendered to me I would not accept it under any circumstances whatever."

Mr. Cannon is to be permanent chairman of the convention, and some expect that he will be confronted by a unanimous nomination for the second place on the ticket. It is now understood that the principal speech for the nomination of Mr. Roosevelt will be made by ex-Governor Black, of New York, and that among those seconding the nomination will be Harry Stillwell Edwards, the author, of Georgia.—At the national convention of the Socialist Party, in Chicago, Eugene V. Debs was nominated for President, and Benjamin Hanford for Vice-President. After heated discussion, a resolution in favor of labor unions was adopted as part of the platform by a vote of 107 to 53.

Judge Parker's Opinions

Elliot Danforth, an intimate friend of ex-Senator Hill, has published a long statement as to the political opinions of Judge Parker, with whom, he says, he has discussed political questions during the last twenty years. The Judge, he asserts, is in favor of reducing tariff duties that shelter Trusts and enable lawless capital to wring extortionate prices from the consumer. He would "smite the subsidy monster wherever it might lift its head." Trusts doing business exclusively within the boundaries of a State should be regulated and controlled by that State, but the Judge would have the efforts of the State supplemented by Federal authority in the enforcement of the Sherman act and the Interstate Commerce law against Trusts engaged in interstate commerce. He would administer the law not in the interest of any lawless element, whether it be capital or labor, but in the interests of the law-abiding American people, thus "reversing a precedent recently established in the White House." The Judge, Mr. Danforth says, "doesn't talk fight much, but," he thinks, "is always ready for it." He believes, however, that our safety as a nation rests not in armies or in navies, but in the supremacy of the moral law. Mr. Danforth repeats as follows what Judge Parker said to him a few weeks ago about the Southern people and the problem that "vexes" them:

"Elliot, they are a great people; they are the countrymen of Washington and Jefferson and Madison and Jackson and Lee. Their courage and their constancy have never failed. They have changed velvet for homespun, and have endured the pinch of honorable poverty, and are just now beginning to reap the reward of their great sacrifices. I have implicit faith in their ability to solve rightly and righteously the problems with which they are confronted, and I believe it is the duty of their countrymen at the North to permit them to solve those problems unmolested by irritating political interference from the outside."

Senator Aldrich publishes a statement in which he predicts that the tariff will be the chief and probably the only issue in the campaign. The Republican party, he says, will uphold the principle of protection, but is not wedded to the present schedules, and will enter promptly upon the work of revision whenever it can be shown that revision is required.

A Mormon's Curious Testimony

At the final hearing in Washington, last week, concerning Senator Smoot and the Mormon Church, the witness was Angus M. Cannon, Jr. It was expected that his testimony would show that President Smith himself had performed a plural marriage ceremony in 1896, six years after the Woodruff Manifesto. But Mr. Cannon said to the committee that he had lied about the marriage of his cousin, Abram H. Cannon, to Lillian Hamlin. A few weeks ago he told the story to Perry S. Heath and several other Gentiles in Salt Lake City, saying he had seen the marriage performed in the cabin of a boat in which President Smith and several other Mormons were making a pleasure trip from Los Angeles to Catalina Island, and at a distance of more than three miles from the shore. Abram H. Cannon already had three wives, and one of these (the witness's sister), he said in Salt Lake to

the Gentiles, left the cabin in anger when the marriage took place. But to the committee this witness asserted that he had told the story "as a joke," being under the influence of liquor. He had not been with the party on the boat, and he did not know that Smith had performed the ceremony. Still, he thought that Smith really had married his cousin to Lillian Hamlin. His cousin died before the end of that year, and Miss Hamlin was present in the house during his last illness. She had a daughter named Marva Cannon, who was recognized as his cousin's child and so treated by his cousin's other children. The witness is not in very good standing in the Mormon Church, partly because he thinks there is "too much Smith" in it. The committee pointed out that immediately upon his arrival in Washington he had been in consultation with Senator Smoot and the latter's counsel. He asserted, however, that they had not spoken to him about his testimony.

Paying for the Canal Property

Secretary Shaw signed on the 7th inst. a Treasury warrant for $40,000,000, drawn in favor of J. P. Morgan & Co., special disbursing agents of the United States, and to be used in paying for the Panama Canal Company's rights and property on the Isthmus. This is the largest warrant ever drawn by our Government. One for $7,200,000 was used in 1868 for the purchase of Alaska; the Halifax award required one calling for $5,500,000, and the payment of $20,000,000 to Spain was made by means of four warrants for $5,000,000 each. The warrant was delivered on the 9th to Morgan & Co., who deposited securities to the value of $25,000,000. Payment is to be made in Paris, where all the arrangements have been in the hands of Mr. J. Pierpont Morgan, whose services, it is understood, have been without expense to the United States. A contract for payment having been made in Paris, the Canal company's property on the Isthmus was formally delivered there to the United States on the 4th, Major Brooke of the Engineer Corps taking possession. Our flag was then raised over the canal offices in Panama. By agreement the company's claims for work done since its offer was made will be adjusted by President Roosevelt. Disbursements in Paris under the warrant will be made gradually; since April 8th the shipments of gold to that city from New York have been $28,000,000. To Panama $1,000,000 has been paid on account. Congress gave to the President absolute control of the government of the canal zone. In conference with Secretary Taft, Attorney-General Knox and the Commission, he has been preparing instructions for the administration of affairs there, including the establishment of courts.

Porto Rico and Other Islands

At its recent session the Legislative Assembly of Porto Rico appropriated $5,000 and provided for the appointment of a Commission to study the causes of anæmia and suggest a remedy for this disease, to which 6,708 deaths (out of a total of 25,552 in the island) were ascribed last year. The members of the Commission are Surgeon Ashford, of the army; Surgeon King, of the Marine Hospital Service, and Dr. Gutierrez, a native physician. A hospital camp for the Commission's experiments has been established at Bayamon, a few miles from San Juan, and nearly a thousand patients have been treated there. The work already done tends to confirm the belief of Dr. Ashford and Dr. King that the anæmia prevailing in Porto Rico is caused by tiny parasites that destroy the red coloring matter of the blood. Following the expulsion of these parasites a gain in vitality is observed. Nearly two-thirds of the people are engaged in agriculture, and the infection appears to be derived from the soil, especially on the sugar and coffee plantations. Owing to the extreme poverty of the laborers—who are, according to the Board of Health's report, in a condition of "chronic semi-starvation"—they are peculiarly susceptible to such infection.—The sugar industry of Porto Rico has been greatly stimulated by annexation, but complaint is made that nearly all the land is owned by Spaniards, who are accustomed to spend their profits in Spain and other foreign countries. The coffee industry suffers from extreme depression, but the islanders hope to gain a market in the States by means of the St. Louis Exposi-

tion. Sea Island cotton, of which 10,000 acres were planted last year, promises to be a profitable crop. Capital from the States is needed, but very little of it has been invested.—A Louisiana sugar planter, returning from a visit to Cuba, advises the sugar producers of his State to move to that island, where the poorest sugar land needs to be replanted only once in eight years, and the price of labor is 80 cents a day. Replanting once in sixteen years is sufficient on good land. He was impressed by the cleanliness of Havana and Santiago, and asserted that he saw more dirt in seven blocks of one street in New Orleans than in the four leading cities of Cuba.—There was substantially no legislation for the Philippines at the recent session of Congress. The bill to encourage the construction of railroads, to permit the issue of bonds by municipalities, to enlarge the grants of land, etc., was not enacted. The Court of Claims at Washington upholds the collection of tariff duties upon goods imported from the States into the islands in the interval between the signing of the Peace Treaty and the establishment of civil government. The sum involved in the case was $81,000, and it is said that similar claims pending exceed $7,000,000. —The territorial expenses of Hawaii were reduced by the recent short session of the Legislature from nearly $4,000,000 to about $2,000,000. Offices were abolished, salaries were reduced by 20 per cent., and the Territory decided to dispense with its National Guard, Government Band and some other luxuries.

Workmen and Employers

In accordance with the resolutions adopted at the recent convention of the National Clothiers' Association, the members of this organization in New York, Philadelphia, Baltimore and Rochester have proclaimed the "open shop" in their places of business. They say they will fight for it to the last, but will neither discriminate against union men nor make any change in hours or wages. The proposed strike of 60,000 employees has been deferred to await the result of further conferences with the employers. It is in opposition to the "open shop" that 5,000 boilermakers and 2,000 helpers are on strike at the shipyards in or near New York. The "open shop" was permitted by an agreement in force during the past year. To a renewal of this agreement the workmen object. A controversy in Pittsburg, which threatened to involve all the undertakings of the American Bridge Company, which is said to be interested in contracts for 60 per cent. of all the steel-frame buildings now going up in various parts of the country, has been settled in favor of the union, which protested against the employment of non-union men in violation of an agreement for the "union shop."—A general strike in the New York, New Haven & Hartford Railroad shops appears to have been averted. The machinists accept an increase of 7 per cent. instead of the 15 per cent. which they demanded, and a similar concession to the 3,000 car workers has been made. On the Atchison road about 4,000 machinists are still out; at Topeka 2,000 were locked out in anticipation of a strike there for higher pay and against the "open shop." Many of these returned to work when an opportunity was given. The company says that the unions have shown their inability to keep agreements. In New Mexico the company obtained from Judge Baker a sweeping injunction some time ago, and on the 6th inst. he declined to modify that part of it which forbids the strikers to talk with the non-union men.—An interesting suit is pending in New York, where two builders seek to recover damages from the officers of a carpenters' union because the members of the union employed by these builders quit work, under orders, to join a sympathetic strike in behalf of a union of plasterers.—It is feared that a disagreement between the Lake Carriers' Association and the Masters' and Pilots' Union will interrupt traffic on the Great Lakes, where 70 per cent. of the tonnage is controlled by the Association, and 100,000 employees might be involved in a strike. The Association, objecting to any increase of wages, asserts that business is dull and that the carriers' earnings are declining.

Liberal Theology in Norway

Facts are multiplying to show that the historic conservatism of the Norwegian Church is not able to exclude progressive theological thought.

Some time ago Professor Jaeger delivered an address to the Theological Society in Christiania, in which he declared that orthodoxy is the enemy of genuine Christianity, mentioning particularly the dogmas of hell, of the absolute divinity of Christ and of the Trinity. The address attracted all the greater attention as Dr. Jaeger, who is one of the most popular of the younger university teachers, had originally been an adherent of the radical agnostic, Dr. Brandes, but had openly renounced this creed in favor of a positive Christianity. His position is, however, anything but outspoken rationalism, and he sees in Christ the ideal and therefore divine man. The movement in favor of liberal theology was fed by two leading publications, one by Dr. Förden, on "The Old Testament in the Light of Modern Research," and the other by Professor Michelet, entitled "Old Sacred Things in a New Light," the former being practically Wellhausian and the other Ritschlian in tone. To meet this movement a conservative Christian congress was called, in which fully 600 participated, of whom 100 were clergymen. The resolutions of the congress were sharp in their denunciation of modern theology, altho it is significant that none of the clergy of Christiania took part in the convention. Professor Michelet and Pastor Förden were both present and defended their views. The new movement has established an aggressive organ in the "Novsk Virkeblad," of Christiania, edited by the versatile Pastor Klaveness.

Fighting in Tibet

The British mission at Gyangtse was attacked on May 5th by the Tibetans, in command of a general from Lhasa, who were repulsed after a hard fight of two hours with a loss of 250 killed and wounded. On the British side two soldiers were wounded. On the following day, during a snowstorm, the British drove the Tibetans from a position which they were fortifying with walls at Karo Pass, between Gyangtse and Lake Yambok, 16,000 feet above the level of the sea. The Tibetans, numbering 1,500, held the position for six hours, and at a loss of nearly 200 men. The British loss was four men killed and 21 wounded. The Amban, or Chinese envoy at the Lhasan Court, promises to meet the mission of Colonel Younghusband at Gyangtse with a representative of the Dalai Lama, but so far he has not appeared. According to the British reports the natives are very friendly, bringing their sick into camp to be cured and trafficking in country produce and curiosities with the soldiers in a bazaar, which is held daily just outside camp. To quote from a recent telegram from Colonel Younghusband:

"To-day 177 Tibetans, mostly women, were selling their goods there. Scene presented was very remarkable and significant. British officers and soldiers, Sikhs, Gurkhas and Bhutians bargaining away peaceably with their foes of a fortnight ago, and giving sharp Tibetan traders exorbitant prices for vegetables, eggs, condiments, matches, cigarets, carpets, trinkets, cotton goods, cooking utensils—even penny whistles. Tibetans are evidently born traders, and they are already sending to Phari for more goods from India."

The Gyangtse monastery is under the immediate authority of the Tashe (or Teshoo) Lama, a rival to the Dalai Lama at Lhasa both in ecclesiastical and secular politics, and formerly possessed of almost as much power and regarded with equal veneration as an incarnated Buddha. In fact, from a theological point of view the Tashe Lama ranks the higher, since he is regarded as the reincarnation of Manjusri or Amitabha, and the Dalai Lama as the reincarnation of his disciple Avaloskitesvara. The British are skillfully playing off these two Buddhist popes against each other. Colonel Younghusband imposed a fine on the Gyangtse monastery because some of the monks were found fighting, but at the request of the Tashe Lama the fine has been remitted. The Dalai Lama of Lhasa regards the Lama of Tashe-Lhunpo as to blame for allowing the mission to proceed through the territory under his control and has deprived him of all authority in the Khambajong district as a punishment. This naturally inclines him still more to the side of the English. It is recalled by the English papers that when Warren Hastings was Governor-General of Bengal he sent two envoys to Tashe-Lhunpo, and maintained one there for three months.

The Achinese There has been almost perpetual warfare against the Achinese by the Dutch in Sumatra for over thirty years, and the engagement reported last month shows that their bravery and spirit of independence are as strong as ever. A body of Achinese occupying a strongly fortified position in the Gajocloeas district were attacked by the Dutch troops and were not dislodged until they had lost 541 of their number. The Dutch loss was three men killed and twenty-five wounded. A month later, about May 2d, a similar fight occurred in which the Dutch attacked the Achinese at Tjantoe, and captured the position after a desperate engagement, in which 190 natives were killed. The Dutch lost seven men killed and five officers and 38 men wounded. It is estimated that in the vain attempt to subdue these Mohammedan Malays the Dutch have sacrificed $100,000 and 12,000 lives. The last important outbreak occurred in 1901.

A Labor Cabinet in Australia The election of last December so largely increased the representation of the Labor Party that it held the balance of power, and it was evidently only a matter of time when the Government of Mr. Deakin would be defeated by the combination of the free traders of the Opposition with the Labor members. On April 22d this crisis occurred and the Government was defeated by a vote of 38 to 29. The Ministry resigned, and a Labor Cabinet was formed, with Mr. Watson as Premier and Treasurer. At the instance of the new Premier the Federal Parliament adjourned on April 27th until May 18th, to give time for the preparation of a party program. The immediate issue was on a labor amendment offered to the Conciliation and Arbitrations Bill, which proposed to extend the scope of this bill to include the employees of the state railways. The bill was similar to the well-known Industrial Arbitration Act of New South Wales, by which the arbitration courts are empowered to regulate all such questions as wages, hours, the employment of non-union men, etc. The extension of such an act to the employees of the railways owned and controlled by the several states of the commonwealth involved constitutional and practical difficulties of considerable complexity. It was questioned by those opposed to the measure whether the constitution permitted interference by the Federal Government with the contracts made by one of the states with its employees, and what power there was to enforce, for example, a ruling of the court requiring a state to raise the wages of the men. On the other hand it is pointed out that the power to legislate " for the peace, order and good government of the commonwealth with respect to trade and commerce among the states " is granted to the Federal Government, and it is argued that a strike on the railways of a single state could not be allowed to interfere with the general traffic of the commonwealth.

The Capture of Feng-Wang-Cheng The official report of the battle of the Yalu cuts the ground from under the attempts made by the Russians to minimize the affair by claiming that it was a prearranged retreat. So far from offering a merely nominal resistance to harass the Japanese in crossing the river, General Zassalitch stubbornly held Kuliencheng and other hights against a force outnumbering his own five to one. The Eleventh and Twelfth Rifle Regiments of the Eastern Siberians were almost surrounded by the Japanese and had to cut their way out by a desperate bayonet charge, in which the soldiers were preceded by a priest, Tcherbackoffsky, holding up the cross until he fell, wounded by two balls. According to the official report the Russians lost on April 30th and May 1st 70 superior and subaltern officers and 2,397 men, killed, wounded or prisoners. Of these 1,081 were left on the battlefield. There were about 10,000 men engaged on the Russian side. The Russians retired to Feng-Wang-Cheng, on the road to Pekin and Mukden, where it was expected that they would make a stand, as this important point is in a mountainous region, approachable only through deep-cut ravines; but General Kuropatkin ordered it vacated, and on May 6th the Japanese, who had approached it with great caution in two columns, supported by batteries, occupied the town. There was some fighting and the Russians destroyed such

stores as they could not carry away. The Russians fell back toward the northwest in the direction of Mukden, and may attempt to hold Mao-Tien-Ling Pass or Tien-Chori-Chan Pass still further west, which is connected with the Russian base, Liao-Yang, by a branch railroad. The importance of the Japanese advance to Feng-Wang-Cheng is that it enables them to co-operate with the force landed on the Liao-Tung peninsula north of Port Arthur, thus giving them practical

control of the whole of Southern Manchuria. Niuchwang will probably be evacuated without a struggle, altho it has recently been intrenched and strongly reinforced. The forts have been dismantled, the artillery placed on trains, and many of the troops have already left for Mukden. The Russian gunboat "Sivoutch," which is in the ice of the river there, will have to be abandoned or destroyed.

Port Arthur Cut Off

Simultaneously with the advance to Feng-Wang-Cheng a second Japanese army was landed on both sides the Liao-Tung Peninsula, north of Port Arthur, and on Friday, May 6th, the railroad was cut at Polantien. The last train which passed before the track was torn up was riddled with bullets, and the train before this bore General Alexieff, Grand Duke Boris and staff, and military money chest to Mukden. The Japanese are reported to have landed 10,000 men at Kinchau Bay, the same number at Fuchau and 700 at Pitsewo. The first landing was made at Pitsewo, as in 1894. The steamers "Hong Kong" and "Nippon" arrived at that point in the afternoon of May 5th, and after a bombardment of the Russian patrols by three gun boats, the marines plunged into the water, breast deep, and waded ashore. As soon as the Japanese flag was seen flying from the hills the troops disembarked, being forced to wade a thousand yards as it was low tide. At the same time another force was landed on the opposite side of the peninsula at Fuchau (Foo-Chow), less than 100 miles north of Port Arthur. Landings were also made at Port Adams and Kinchau, which is just north of Dalny on the western coast of the Liao-Tung

Peninsula. From these points the Japanese have moved south and invested Dalny, on Talienwan (Talien Bay), the most important of the new Russian commercial ports. Dalny is not well fortified, as it was supposed to be protected by its proximity to the naval station at Port Arthur, and no resistance was offered. The number of troops besieged in Port Arthur under General Stoessel is variously estimated between the limits of 5,000 and 10,000. A determined effort was made to close the harbor on May 3d, and, according to Japanese accounts, it was successful, but the Russians assert that there is still room in the channel for the passage of ships. The blockading flotilla, consisting of twelve merchantmen loaded with stone and manned by volunteer crews, started for Port Arthur on Monday evening, but were separated by a gale. Commander Hayashi, in command of the naval escort, signaled all night for them to abandon the expedition, but the boats were driven too far apart to receive the orders and each proceeded independently in the morning toward the entrance to the harbor. The first, the "Mikawa," forced its way into the inner channel, where it was anchored, blown up and sunk, the crew climbing up the mast and cheering for Japan. Seven of the other vessels were sunk, either by their own crews or the Russians, near the entrance. The crews showed great courage and skill, for the harbor was thoroughly protected by mines and booms. An incessant fire, directed by searchlights, was brought to bear upon the blockading vessels, which caused great loss of life to the Japanese, altho it is not known how many escaped by swimming or were captured. Many of the sailors who reached the shore refused to surrender, and either died fighting or by suicide. The average tonnage of the ships sunk was over 2,000 tons.

Zionists in Africa

The proposition of the British Government to give the Zionists land in Africa for a Jewish colony has been accepted and the land selected. It is a tract of 5,000 square miles northeast of Lake Victoria Nyanza, including the Nandi plateau; fertile, well watered, forested and almost uninhabited. It is only five miles distant from the Uganda Railway, and thirty hours by rail from the coast. If the colony prospers the concession may be enlarged to include a port on the Victoria Nyanza. A committee will start in June to examine the site, and Dr. Herzl will soon address mass meetings in London in favor of the enterprise. The Zionist movement was started to provide a place of refuge for persecuted Jews from all over the world by refounding the Jewish nation in Palestine, but the attention of the leaders has recently been diverted to the more practicable plan of establishing the colony in East Africa instead. This change of purpose caused great resentment among many of the Zionists by those whose religious and racial aspirations, based on the biblical prophecies, would be satisfied with nothing less than actual return to the original Zion, and those who have favored the African scheme as a temporary expedient have been accused of being traitors to their cause. One of these zealous Zionists a few months ago attempted to kill Dr. Max Nordau on account of this.

The Rising in Nigeria

The outbreak of the natives in Southern Nigeria is proving to be a very serious thing. The Okpotos ought to inspire as much respect in the British as the Zulus, for they, too, have shown themselves strong enough to break a British square. The punitive expedition sent against them has met with a severe reverse on account of the fierce fighting of the natives, who penetrated to the center of the square and killed many of the soldiers. The rising was secretly concerted by a society known as "the Silent Ones," organized for the purpose of driving out all the Europeans. The members of this society are under vows never to speak, but use sign language. They massacred two British officers and a number of native soldiers and Christians, and the mission property at Akwuku was destroyed. The missionaries escaped to Assaba in safety. This is the third rising in the Assaba *Hinterland* since 1898.

The New Evangelism

BY WALTER RAUSCHENBUSCH

Discussed by Russell H. Conwell, William R. Richards and William S. Rainsford.

[Professor Rauschenbusch is the head of the Department of Church History in Rochester Theological Seminary (Baptist). From 1886-97 he was pastor of a working people's church on the West Side of New York City, where he shared the life of the working people and was deeply interested in social problems. We consider the following article from his pen of very great importance, and have accordingly asked Mr. Conwell, the pastor of the most successful Protestant church in America in point of numbers; and Dr. Rainsford and Dr. Richards, the ministers of the most successful Episcopal and Presbyterian churches in New York City, to comment upon it.—EDITOR.]

THE present interest in the "New Evangelism" is almost wholly an expression of dissatisfaction with the old evangelism, the waning power of which is generally conceded. There is as yet no new evangelism before us which we might adopt; we are only wishing that there might be. Our conceptions of what it ought to be are vague, as all ideas about the future necessarily are, but that is no cause for belittling the current inquiry. It is one of the most important topics that could be discussed. I shall attempt in the following discussion to apply the same method of historical investigation to this great and threatening fact of contemporary religious history which would be applied to a fact of equal importance in a past era.

The Gospel of Christ is one and immutable; the comprehension and expression of it in history has been of infinite variety. No individual, no Church, no age of history has ever comprehended the full scope of God's saving purposes in Jesus Christ. Neither has any proclaimed it without foreign admixtures that clogged and thwarted it. A fuller and purer expression of the evangel has therefore always been possible and desirable. It is on the face of it unlikely that the Gospel as commonly understood by us is the whole Gospel or a completely pure Gospel. It is a lack of Christian humility to assume that our Gospel and *the Gospel* are identical.

Every individual reconstructs his comprehension of life and duty, of the world and God, as he passes from one period of development to the next. If he fails to do so, his religion will lose its grasp and control. In the same way humanity must reconstruct its moral and religious synthesis whenever it passes from one era to another. When all other departments of life and thought are silently changing it is impossible for religion to remain unaffected. The Gospel, to have power over an age, must be the highest expression of the moral and religious truths held by that age. If it lags behind and presents outgrown conceptions of life and duty, it is no longer in the full sense the Gospel. Christianity itself lifts the minds of men to demand a better expression of Christianity. If the official wardens of the Gospel from selfish motives or from conservative veneration for old statements refuse to let the spirit of Christ flow into the larger vessels of thought and feeling which God himself has prepared for it, they are warned by finding men turn from their message as sapless and powerless. The most familiar instance is that of the Revival of Learning and the repudiation of medieval religion and theology in the fifteenth and sixteenth centuries.

We are to-day passing through an historical transition as thorough and important as any in history. The last 125 years have swept us through profound changes in every direction. World-wide commerce and the imperialistic policy of the Christian nations have made the problems of international and inter-racial relations urgent. The Church responded by a new movement of world-wide missions, but it has failed hitherto to Christianize international politics. The monarchical system, so intimately connected with ancient religion,

has crumbled and democracy has taken its place; but the Church has not broadened its ethical teaching to any great extent to meet the new duties of the citizen-kings. It still confines its ethics to the *personal* and *family* life. In industry and commerce there has been a vast increase in the production of wealth and a shifting it its distribution, but the Church has furnished no adequate principles either for the distribution or the consumption of wealth. We are emerging from the era of individualism. The principle of co-ordination, co-operation and solidarity is being applied in ever widening areas and is gaining remarkable hold on the spirits of men. The Church is applying that principle in its organization, but its message is still chiefly on the basis of individualism.

It is not strange if the message of the Church has failed to keep pace with a movement so rapid. But neither is it strange if humanity, amid the pressure of such new problems, fails to be stirred and guided by statements of truth that were adequate to obsolete conditions. The Church is in the position of a mother talking to her son of seventeen, as if he were still twelve. What she says is good and loving, but it is not what the boy with his new passions and problems needs.

The present paralysis of the churches affects all Western Christendom and only a cause co-terminous with modern civilization will explain it. Communities are affected in just the degree in which they are affected by the progress of civilization—the backward countries and rural communities least, the industrial cities most. State churches and free churches alike feel the drag. It is not because the religious spirit has failed. It runs surprisingly strong, but it runs largely outside of the churches. Neither is the trouble due to lack of piety in the ministry, for, on the whole, we are as good as our fathers. We are told that the Gospel has always met with indifference and hostility. But is this to-day a persecution for righteousness' sake, so that Jesus would call us blessed for enduring it, or is it a case where the salt is trodden under foot of men, because it has lost it's saltness? The worst explanation is that which shrugs its soulders and regards the present alienation of the people from the Church as a mysterious dispensation of Providence against which we are helpless. Effects do not happen without causes, and God's reign is a reign of law. In short, no small or local or passing cause will explain so large a fact as the present condition of the Church.

Now, apply this to evangelism. Evangelism is only the cutting edge of the Church, and it is driven by the weight back of it. The evangelizing power of the Church depends on its moral prestige and spiritual authority. Every evangelist banks on the accumulated moral capital of the Church Universal.

There are two kinds of evangelization. The one proclaims new truth, as Jesus did to his nation, or Paul to the Gentiles, or as a missionary does to the heathen. The other summons men to live and act according to the truth which the Church has previously instilled into their minds and which they have long accepted as true. The latter is, on the whole, the kind which we have to do. To be effective, evangelism must appeal to motives which powerfully seize men, and it must hold up a moral standard so high above their actual lives that it will smite them with conviction of sin. If the motives urged seem untrue or remote, or if the standard of life to which they are summoned is practically that on which they are living, the evangelistic call will have little power. The two questions which every Christian worker should investigate for himself are these: Are the traditional motives still effective? And is the moral standard held up by the Church such as to induce repentance?

The motives urged at any time will vary with the preacher and the audience, and there will always be a large measure of truth and power even in the most defective preaching that touches human nature at all. Yet there is a change in emphasis from age to age. Within our own memory the fear of hell and the desire for bliss in heaven have strangely weakened, even with men who have no doubt of the reality of hell and heaven. On the other hand, the insistence on present holiness and Christian living has strengthened. Good men give less thought to their personal salvation than our fathers, but their sympathy for the sorrows of others is more poignant.

Past Christianity has developed in us a love for our fellows and a sense of solidarity so strong that they demand to be considered in every religious appeal. On the other hand, we cannot conceal from ourselves that the old "scheme of salvation" seems mechanical and remote, and its effectiveness as a motive depends largely on the past teaching of it, which is stored in our minds. The sense of great coming changes, begotten by a better knowledge of the plastic possibilities of mankind, is strong upon us. We have a new hope for humanity such as has long existed only where the millennial hope was a vital thing.

Even so brief an enumeration must make us feel that some motives are dropping away, because they were narrow and incompletely Christian, and larger and more truly Christ-like motives are offering themselves. It should be the scientific effort of every Christian worker to observe what motives are to-day really effective with the young and thoughtful minds who represent the present and future. The fact that some evangelists who are determined in repudiating anything that savors of "modern thought" are so effective in urging the old motives does not invalidate what we have said. In every large city there are many men who belong to the old time and are untouched as yet by the new. They respond joyfully to the ideas in which their Christian life was nurtured and in which their holiest memories are enshrined. But there are other men who come once and then stay away, because they hear nothing to which they can respond. And these men are not counted. Moreover, the strong personality of the evangelist may count for more than anything he says.

What about the moral standard held up by the Church in its teaching and in its collective life? Can she summon men to repentance by it?

The moral teaching of the Church in the past has dealt with private and family life. It has boldly condemned drunkenness, sexual impurity, profanity; it has fostered gentleness and pity, and it has been largely successful in this teaching. It has also drawn the line against Sabbath breaking, dancing, card-playing and theater-going, but it has not been successful in maintaining that line. In general, the community has risen toward the level of the Church in private and domestic virtue, and the Church has drifted toward the level of the respectable community in regard to amusements. As a result of both movements the gap has lessened. The morality of the Church is not much more than what prudence, respectability and good breeding also demand. Nor is the morality of church members generally distinguished by the glow of spiritual fervor. There is less family worship and prayerful life than with our fathers. But with this moral outfit can the Church authoritatively say to the world, "Repent and become like me?"

When we pass from private and domestic life to political and business life the matter is worse. About the most pressing questions arising there the Church as a body is dumb. It has nothing to say about the justice of holding land idle in crowded cities, of appropriating the unearned increment in land values, of paying wages fixed by the hunger of the laborers and taking the surplus of their output as "profits," or of cornering the market in the necessaries of life. It feels restless about some glaring evils like child-labor, but only moderately so. Individuals in the Church are intelligent and active, but the Church, both as an organized body and as a corporate spiritual force, is inert. The moral guide of humanity is silent where authoritative speech is to-day most needed. Where it does speak, it is often on the wrong side. When we consider the ideas prevalent in the churches, their personnel, and their sources of income, has the Church a message of repentance and an evangel for this modern world?

One important and growing class in our population is largely alienated from the Church—namely, the industrial wage-workers. The alienation is most complete where the industrial development under the capitalistic system has most completely run its course. In our country that alienation has begun within the last generation, during which this class has become a class, and the process is not yet complete. This constitutes the spiritual barrier to evangelistic efforts as soon as they go beyond the young people of the families already in the churches. Our evangelistic call strikes an invisible

wall and comes back in hollow echoes. It is an untrue and cruel charge to say that the Church workers have not done their best to reach the people. The efforts of the churches in the great cities for the last generation have perhaps never been paralleled. And yet they are futile. This is one of the most stunning and heart-rending facts in all our life.

The Church has passed under the spiritual domination of the commercial and professional classes. I do not mean that they alone compose its membership; but they furnish its chief support, do its work, and their ethics and views of life determine the thought of the Church more than we realize. This is not due to any wrongful attempt to make the Church subservient, but rather to the fact that they are the dominant classes in all industrial nations, in literature and politics, as well as in the Church. Now the stratification of society is becoming more definite in our country, and the people are growing more conscious of it. The industrial conflicts make them realize how their interests diverge from those of the commercial class. As that consciousness increases, it becomes harder for the two classes to meet in the expression of Christian faith and love—in prayer meetings, for instance. When the Christian business man is presented as a model Christian, working people are coming to look with suspicion on these samples of our Christianity. I am not justifying that, but simply stating the fact. They disapprove of the Christianity of the churches, not because it is too good, but because it is not good enough. The working people are now developing the principle and practice of solidarity, which promises to be one of the most potent ethical forces of the future, and which is essentially more Christian than the covetousness and selfishness which we regard as the indispensable basis of commerce. If this is a correct diagnosis of our condition, is it strange that the Church is unable to evangelize a class alienated from it by divergent class interest and class morality?

Let us sum up. The powerlessness of the old evangelism is only the most striking and painful demonstration of the general state of the churches. Its cause it not local nor temporary. It does not lie in lack of hard work or of prayer or of keen anxiety. It lies in the fact that modern life has gone through immense changes and the Church has not kept pace with it in developing the latent moral and spiritual resources of the Gospel which are needed by the new life. It has most slighted that part of the Gospel which our times most need. It lacks an ethical imperative which can induce repentance. In private life its standard differs little from respectability. In commerce and industry, where the unsolved and painful problems lie, it has no clear message, and often claims to be under no obligation to have one. In the State Churches the State has dominated; in the free Churches the capitalist class dominates. Both influences are worldly—in favor of things as they are and against the ideals which animate the common people. The people are becoming daily more sensitive to the class cleavage of society. The Church suffers under the general resentment against the class with which it is largely identified. To this must be added the fact that the spirit of free inquiry engendered by modern science neutralizes the dogmatic authority with which the Church has been accustomed to speak.

The new evangelism which shall overcome these barriers and again exert the full power of the Gospel cannot be made to order nor devised by a single man. It will be the slow product of the fearless thought of many honest men. It will have to retain all that was true and good in the old synthesis, but advance the human conception of salvation one stage closer to the divine conception. It will have to present a conception of God, of life, of duty, of destiny, to which the best religious life of our age will bow. It will have to give an adequate definition of how a Christian man should live under modern conditions, and then summon men to live so.

A compelling evangel for the working class will be wrought out only by men who love that class, share its life, understand the ideals for which it is groping, penetrate those ideals with the religious spirit of Christianity, and then proclaim a message in which the working people will find their highest self. They will never be reached by a middle class gospel preached down at them with the consciousness of superiority.

If we personally are to have a share in working out the new evangel, we shall have to be open to two influences and allow them to form a vital union in our personalities. We must open our minds to the spirit of Jesus in its primitive, uncorrupted and still unexhausted power. That spirit is the fountain of youth for the Church. As a human organization it grows old and decrepit like every other human organism. But again and again it has been rejuvenated by a new baptism in that Spirit. We must also keep our vision clear to the life of our own time. Our age is as sublime as any in the past. It has a right to its own appropriation and understanding of the Gospel. By the decay of the old, God himself is forcing us on to seek the new and higher.

This attempt at a diagnosis of our ills is not offered in a spirit of condemnation, but of personal repentance and heart-searching. We all bear our share of guilt. I have full faith in the future of the Christian Church. A new season of power will come when we have put our sin from us. Our bitter need will drive us to repentance. The prophetic spirit will awaken among us. The tongue of fire will descend on twentieth century men and give them great faith, joy and boldness, and then we shall hear the new evangel, and it will be the Old Gospel.

ROCHESTER N. Y.

BY RUSSELL H. CONWELL, D. D.
Pastor of the Grace Baptist Church, Philadelphia

Professor Rauschenbusch's article is, when taken in its entirety, a very emphatic and clear presentation of the apparent fact that no one, not even the deepest thinkers, know what is the trouble with modern evangelism. It does not seem clear that even the symptoms are distinctly recognized. An engine refused to draw the train, and the trainmen and passengers all went out to guess what was the matter, until they began to guess whether other guesses might not be correct. Another engine came up and pushed the powerless machine into the shop. We never heard whether any one, by some blunder, guessed right. That the Christian customs and work are undergoing great changes now, amounting to transmigration, seems to be the only thing about which we are sure.

Of that, and of nothing more, does the Professor seem certain. He has stated the conditions admirably and has probably done well what he was asked to do. But the remedy is not prescribed, because no one understands the disease. Long meditation and sincere discussion appear to be necessary to find the cause. Hence, THE INDEPENDENT is doing good service by encouraging discussion.

Professor Rauschenbusch says we are in transition; and we believe him. But what are we leaving, and to what are we going? Religion, like love, may express itself in a thousand forms, but tends, like water, to come back to a standard level and to reappear in the same way in new people. The young newly mated pair live in a modern house with all the recently discovered appliances, but there is enough left of real nature in their conduct and appearance to lead an old man of eighty to live over the beautiful days when he went to keeping house in two rooms. So, joining Professor Rauschenbusch and the other guessers, the writer cannot believe the transition is going very far. The old statement of creeds and the old, wild revival may pass away, but preaching and teaching, and singing and doing good will remain in places of power. Of course, "the Church" will survive and may again be in name, as it is now, perhaps, in fact, the chief instrument used by the Divine Spirit to convert the world. But there will, perhaps, be war over the definition of a real Christian Church. The claim must soon come that Young Men's Christian Associations, Young Men's Unions, the Christian Endeavors, religious clubs and charitable societies are all true Churches, as they will try to prove by their deeds.

Perhaps the dead Churches are reappearing in these new forms. The same spirit surely, and why not the same Church? Perhaps it is better to let the old forms die. Far better that some so-called Churches should be buried than to exist as they do now, to fill the air with the malaria of unbelief, hatred, irreverence and ridicule, making it impossible for true religion or decent common sense to live near the house of Painted Disease. A steeple on a morgue will not

make a church. Perhaps we are being wisely driven "back to Christ;" and all these once useful liturgies, creeds, organizations, denominations and pious tones are going away to stay, and we may be compelled to begin to look for a new Spiritual Church from house to house, as they did in the simple, sincere days of the Apostles.

It looks to the writer as if the confusion is to be greater, the darkness deeper and the fermentation more violent, before the "future" Church will begin to crystallize into definite form. But no one need feel discouraged. The pressure of the Spirit is stronger, prayers are more fervent, and the willingness to go anywhere with Christ, regardless of the ties of bigotry, is growing apace. There shall be a new Church, and it must be also the old-fashioned Church. It will be all new, as love, Christ and God are always new. What sort of a bird will hatch out of the egg this religious century has laid must be a matter of conjecture in some respects. Its size, color, wings, beak, eyes and voice are unknown. But that it will be strong, beautiful and sweet voiced, and that it will fly high and hold the eyes of the world no devout reader of the Old-New Bible, which has now come back to stay, can entertain a doubt.

By William R. Richards, D.D.

Pastor of the Brick Presbyterian Church

New York City

This article is timely and of great power. Like the recent address on the same theme by Dr. Watson, of Liverpool, it starts with the thought that we are now emerging from an era of individualism to one of solidarity, and that the coming religious revival must conform in some measure to this change in the thought and need of men. That is a truth which will bear frequent telling till the Churches have mastered it.

Meanwhile, however, it would not be safe to forget another truth—namely, that individualism itself was an emergence from the solidarity which had characterized earlier civilizations, classic and Hebrew. It marked a great advance in Hebrew conceptions when Isaiah substituted for the whole people the thought of the righteous remnant; a still greater advance when Paul brought out the individual man, who must finally bear his own burden, and give account of himself to God.

This new individualism proved to be of the essence of the new faith, for the partial loss of it involved the deadly corruption of the Church, while its re-emergence constituted the great Reformation. Since the sixteenth century it stands as one of the achievements of our race, which we can never afford to surrender.

Indeed, in the presence of certain recent developments of false collectivism in the industrial world, on the side both of capital and of labor, may there not be needed even now a religious revival of personal freedom and individual accountability? The fact is significant that the most conspicuously successful evangelistic work of recent years was conducted under Dr. Torrey in Australia, the very land that had carried industrial collectivism to the utmost limit, and that this revival has been simply an old-fashioned campaign for individual salvation.

These things are said, however, not to contradict, but to supplement the admirable statements of the paper. It would be well if the official leaders of our Churches could study some of those thoughtful paragraphs with searchings of heart; for in times of ferment the ministers of comfortably established Churches have often shown themselves blind to the signs of the times, the stubbornest of all opponents of needed reform.

By William S. Rainsford, D.D.

Rector of St. George's Church

New York City

It is profoundly true that the Gospel of Christ is one and immutable; that no individual, no Church, no age, has ever comprehended its full scope. Why should we look, then, for a special new evangel? If we are true men, the spiritual eye of us kept single, our whole body shall be full of light, but not the sudden light of a new evangel; surely, rather, the growing light granted to those who see in all advances of man's knowledge, in all growth of his spiritual faculties, even in all his restless discontent with past belief and past conditions, God ever mak-

ing thin and thinner that veil through which we gaze on him. The new evangel is here already in our hearts, and on our lips, too. As St. Paul wrote to the Galatians of himself, "It pleased God, who separated me even from my mother's womb, to reveal his son in me," so we, too, are separated, and in us and to our day the immanent God is revealing himself. This is the only new evangel we have the right to look for, the only new evangel the world or the Church needs. And just so soon and just so far as we, even as the great Apostle did, stop "conferring with flesh and blood," the beauty, power and sufficiency of that evangel will shine forth upon mankind again.

The paper seems to me to be altogether admirable. It is, however, a practical denial of its opening statement—namely, that there is no new evangelism before us which we might adopt. There is a new evangel. It is here to-day. It is leavening the Church, it is salting the world, and it cannot be trodden underfoot of men.

The Democrats and the Presidency

I.—TWO POSSIBILITIES—CLEVELAND AND OLNEY

[It is still an unanswered question whom the Democrats will select to oppose President Roosevelt. There are over half a dozen Democratic possibilities, whose chances encourage their supporters. We have therefore asked the best qualified publicist we know of to give our readers the benefit of his personal and political intimacy with Cleveland, Bryan, Parker, Hearst, Cockrell, Gray, Olney and Gorman. We shall print his views in four successive articles, which cannot fail to command wide attention.—EDITOR.]

IN the fall of 1884 a prominent Massachusetts Democrat, passing through Albany, called upon the Governor of New York, soon to become President of the United States. The visitor broached the subject of protection and free trade. Grover Cleveland was silent a moment, and then, removing a "long nine" cigar from his lips and following it with a gust of smoke, practically closed the conversation with the brief assurance: "I don't know a —— about the tariff!"

Had this statement got into print in July or August it might have figured through the rest of the campaign, side by side with Hancock's famous apothegm, "The tariff is a local issue," and changed the current of history. As it was, few persons heard of it, and those few understood. All Mr. Cleveland meant was that he was not an economic expert like John G. Carlisle or William R. Morrison. When he tackled any great question, all he could see in it was one central idea, free from distracting subtleties. In the tariff controversy, for example, as shown by his message three years later, what engrossed his thoughts was not a catalogue of technical inequalities in the existing system, but the broad notion that to tax one man for the direct benefit of another is robbery; that at the bottom of all fair industrial competition must lie the right to purchase the raw material in the cheapest markets of the world; and that commerce consists of exchange—not of all selling on one side or all buying on the other. His views on silver, likewise, were confined substantially to three simple propositions: That silver is worth less in the markets of the world than gold; that to contract a debt at a gold valuation and pay it in silver is dishonest; and that it is always the poor man who is worst hurt by such an iniquity. In the very limitations of his knowledge, indeed, lay his strength with the "plain people," who read his heavy platitudes and hailed them as discoveries; for before an elementary proposition, however ill-clad in turgid phraseology, the most elaborate abstractions fall down. In any group of a million men, gathered at random, more thousands of minds will grasp one statement

of opinion disguised as an axiom, than can catch even the drift of a long chain of logical reasoning; and all Mr. Cleveland's conclusions are delivered, as it were, in chunks fresh dug from a mine of primordial wisdom, with the scars of the spade still on them.

So many of his letters and speeches, ostensibly on subjects of the most ordinary sort, are loaded with ethical pronouncements, that persons who have never come into close contact with Mr. Cleveland regard him as a pure idealist. Nothing is further from the truth. He is an eminently practical man. His idealism is a good deal like his religious observances, which he regards as the recognition of a right and safe standard, no matter how far the sterner business of life may move him to depart from it. For example, he has never missed an opportunity to pay a tribute to civil service reform; yet it was no secret that he made use of the Government patronage to smooth the passage of the silver repeal bill through Congress in 1893 till the professional reformers were driven almost to frenzy. One of them, an eminent publicist, made a journey from New York to Washington to expostulate. As he described their conversation to me afterward: "The President laid his hand upon my arm, and, looking me straight into the eyes, said: 'Mr. Z——, I am under a sacred obligation to the American people to pull them out of this silver ditch. It is a tremendously difficult task. If, through any lack of tact, I should fail, you would be one of the first men in this country to reproach me for it.' And," added the reformer, "I was compelled to confess that I should."

There is no doubt in the mind of any one who knows Mr. Cleveland that he is absolutely sincere in the positions he takes and the prophecies of evil he utters. He believed firmly, when he wrote his first anti-silver letter in 1885, that a desperate financial panic was impending, altho the sequel proved that it was still eight years distant. He was sure in 1887 that the American people were on the straight road to the poorhouse unless the tariff were altered to suit their needs, tho universal bankruptcy has not yet come. The perils of expansion, foreseen by him a dozen years ago, have meanwhile faded into the background of

Ex-President Grover Cleveland and Mrs. Cleveland

his own mind far enough to enable him to refer to the Philippines as part of "our common country." But he is probably only dimly conscious to-day that his forecasts have not come to fulfilment according to schedule.

One thing which has always stood in the way of Mr. Cleveland's popularity has been his impatience of interference. He must be not only head of the state, but most of the subordinates also. His methods are plodding. He writes his communications, public and private, with his own hand, being unable to dictate. It used to be said of him that the worst fault he found with life in the White House was that he was not allowed to run the elevator. Altho hurling thunderbolts of constitutional exposition at Congress when it ventured to trench upon the executive domain, he became peevish when he could not procure promptly any legislation he desired, or when a Senator or Representative criticised him from the floor. He held very proper views of the wastefulness of the American handshaking habit since the Presidency has become so burdened with important business; but, instead of reducing it to a minimum and tolerating it as a necessary nuisance, he practically cut it off altogether. In his second administration he filtered all approach to his presence, even for persons who were not office-seekers, through a private secretary, to whom the visitors must either lie or reveal their most confidential business. If this clumsy system led to trouble, he never blamed himself or his secretary, but always the person who refused to communicate momentous secrets to an unknown subordinate.

In spite of his faults, however, there is so much in Mr. Cleveland's character and career to command the admiration of Americans that the almost universal tendency is to overlook blemishes of detail in contemplating his general effect. Agree with his views or not; admit his lack of the intellectual quality which has made statesmen out of some very inferior moral clay; ridicule, if you will, the sophomoric style of his state papers; grant all the heavy and irresponsive quality which is charged upon him on the social side; and there still looms out of this mist of limitations the heroic figure of a courageous man and faithful public servant. None other could have framed the message of 1887 as a tribute to conscience, in the face of every warning that it meant his defeat for re-election. None other would have written the Cooper Union letter of February 10th, 1891, denouncing the silver heresy —a production hailed by his enemies as an instrument of quick suicide. None other would have brought the iron hand of the law down upon the riotous railroad strikers of the West in 1894. None other would have called an extra session of Congress for the silver fight, so that the decks could be cleared for fresh work before the regular session began. None other would have held up to public scorn, at the risk of splitting his party, the handful of Sugar Trust Senators on the Democratic side. None other would have left two great supply bills to die unsigned on the day he quitted office, because they contained some provisions too vicious for his stomach.

One story illustrative of Mr. Cleveland's courage, for which I am able personally to vouch, is probably too obscure to have ever got into print before. In the very heat of the Presidential campaign of 1884 a New York State office-holder—a personal selection and distinct favorite of the Governor's—was discovered to be a defaulter. The man who made the discovery was the publisher of an influential newspaper which was supporting the Cleveland ticket. He hastened to Albany, and, in a private interview, laid the facts before the Governor. Then he paused. Mr. Cleveland, whose face had come to look like a thundercloud as the story progressed, responded: "Well! go on."

"I've nothing to add," said the visitor, "except that I wanted to consult you about holding back the news of this thing. I am the only outsider who knows it, and matters are now in such shape that there could not be any more stealing. It might be bad politics to explode a scandal about one of your friends right in the middle of the campaign."

"Oh, never mind politics!" growled the Governor, angrily. "If you are sure of your facts, print them. Wherever you find a rascal under my administration, drag him out!"

Mr. Cleveland has broken with his party organization—this man of nerve—

PRINCETON INDORSES CLEVELAND.
Mr. Cleveland may yet be forced to take the democratic nomination.
From the Minneapolis *Journal*

but he has kept his own hold upon public respect, while the party has passed through a long ordeal of distrust. The elements that fought him from start to finish of his last administration have united twice since then upon a candidate who represents substantially everything that he does not. Their failure at both elections, with a worse defeat the second time than the first, shows that, whatever the excellence of the party's earlier traditions, it must furnish a hostage for its good behavior now in the shape of an acceptable leader if it would work its way back into grace. If not Cleveland, it must present one as nearly as possible of the Cleveland type.

Of the Democratic dynasty founded by President Cleveland after an interregnum of a quarter century, the only heir-apparent is Richard Olney of Massachusetts. Tho intellectually his ancestor's superior, he manifests enough of the same qualities to entitle him to any honors that may depend upon inheritance.

Underpin the brow of a Chief Justice with the jaw of a bull dog, set the combination upon a short, thick neck and shoulders as square as a yard arm, and you have Olney outlined in your mind. His physical portrait was not obtainable when, at the age of fifty-six years, he accepted his first public office as Attor-

ney-General in the Cleveland Cabinet, for up to that time he had never faced a camera. This seems to indicate that his self-assurance had in it no element of vulgar personal vanity.

Probably no man has been more widely misunderstood by the public in some respects. He was wearied and disgusted by the political cares of office more than flattered by its honors. He had scarcely met Mr. Cleveland before his selection for the Cabinet, but was his stanch admirer, and had presided at a meeting in Boston in the summer of 1892, where he declared that the American people had come to associate with the name of the ex-President "whatever is best and highest in the character of a public man, . . . honesty, justice, patriotism, sincere convictions and the courage of those convictions." And yet he was so far from being a mugwump in the ordinary sense of the word that he had never refused his support to a Democratic ticket in Massachusetts, except when Butler ran for Governor, and then because no one could make him believe either candidate or following Democratic; while in the Presidential campaign of 1896 he remained silent out of deference to his chief, and in 1900 announced himself for Bryan, as a refuge from a longer Republican dispensation. The mugwump is a partisan off his trolley; Mr. Olney is

CHORUS OF PUZZLED DEMOCRATS: "What's he givin' us?"

From the Cleveland *Leader*

a partisan who keeps in touch with the motive power, tho swearing at the management.

There never was a man in high office in Washington, I venture to say, who took less pains to stay there, or who snapped his fingers with more royal disdain at the suggestion of possible promotion in store. His horror of wasting time was acquired in a busy city of the North, and was out of keeping with the atmosphere of the Potomac Valley. He revolted at the idea that he must occasionally meet the representatives of the press and make clear to them, as the recognized media of communication with the people, the meaning of some of the Administration's policies. He objected to the demands made upon his time by Congressmen; and a Representative from Georgia, who called to discuss sundry Southern appointments, was met with the brusque warning: "You will have to be brief!" The Georgian's temper flared up at once. He declared that in the course of his experience in Congress he had never been so rudely treated; and he refused to be pacified, tho Mr. Olney, perceiving his mistake, did his best to repair it. A similar but even more irritating experience was suffered by William L. Wilson of West Virginia, the most distinguished man in Congress in his day. The Attorney-General's office was crowded with visitors who had called on patronage errands, and Mr. Olney was harassed and out of sorts. Into the midst of the gathering came Mr. Wilson on a legitimate mission, and instantly the crowd, in token of respect, fell back to give him the first place in line. He stepped forward with a pleasant greeting, which was cut short by a reprimand:

"You have come up, sir, out of your turn. This is an injustice to others who have been waiting longer, and you will have to go back and take your place as the last arrival."

Mr. Wilson's face flushed, but with frigid dignity he made the speaker repeat the statement, on the plea that he was not sure whether he heard it aright. Then he responded, as he moved toward the door: "I will go back, and when you wish to see me you may send me word."

It was not till after he was beyond recall that the Attorney-General discovered whom he had affronted. Of course, he took prompt steps to undo his error, and later the two men became most friendly and fellow members of the Cabinet.

It must be said, in justice to Mr. Olney, that his bad manners were only skin deep, and were due in part to his inexperience in brushing against men of all sorts and in part to his sincere desire to give his best service to the public, which he could not do if he were at the mercy of every bore who saw fit to intrude upon him. His sense of the superiority of his own surroundings to those of less fortunate humanity was often shown also in a way that made him enemies. A gentleman calling in behalf of a group of Indian police who had been indicted in a Dakota court for acts committed by order of their agent, found him utterly obdurate.

"You wish me to desist from prosecuting men who have broken the law," said he, "but you have given me no good reason. They will have the same jury trial as any one else, and they can tell the jury all about their acting under orders. That is a question of fact. The law must take its course."

"But justice will not," pleaded the stranger. "Indians have a hard time when they get into trouble with white men in that country."

"Then they ought to keep out of trouble with white men," sneered Mr. Olney. "The machinery of government cannot stand still because of a difference in the color of men's skins."

"I am afraid you do not understand the local conditions," the visitor persisted. "You have never spent much time in the West, have you?"

The Attorney-General's eyes snapped, as he threw up his spread hands in a gesture of invocation and exclaimed with mock fervor:

"God forbid!"

Then he laughed at his own irony. The other man reached for his hat. The Attorney-General's grin relaxed, and in a tone intended to be mollifying he said:

"I'm sorry I can't help your Indian friends, but you see——"

"I see," interrupted the retreating visitor, as he held the door back before slamming it, "that these poor fellows live on the wrong side of Beacon Street to appeal to your broad Bostonese sympathies!"

He did not stay to see how this parting shot struck. I happen to know that the two men have since become pleasantly acquainted, but you cannot convince the champion of the Indians that Richard Olney will ever be a full-grown human being till he has traveled.

THE UNAPPRECIATIVE LISTENER.

From the Bridgeport *Post*

From such illustrations as this it must not be inferred that Mr. Olney is wholly devoid of interests outside of his own social stratum. He is simply, always and everywhere, the lawyer before he is anything else. If his client is the Government, the Government's case is right, no matter whether it involves a defense of an income tax that would put both Beacon Hill and the Back Bay into the pillory, or imprisoning an anarchist by whose orders a mob has held up a mail-train. In one case he provokes denunciation as a socialist—heaven save the mark!—in another as the hired attorney of wealth against poverty; but he is equally indifferent to both assaults. When his attention was called, in the Department of Justice, to an order of a Reading Railroad receiver blacklisting members of the Trainmen's Brotherhood,

he responded at once and most effectively. A test case of two blacklisted employees had been carried into a United States court. Mr. Olney said that in his official capacity he could not interfere, but as a private citizen he could do what he pleased. So he wrote to Judge Dallas and the counsel for the Brotherhood a letter in which, as plain Richard Olney of Massachusetts, he declared that Congress had by statute authorized labor organizations; that the Brotherhood was a lawful association, and hence that neither a United States court nor a railroad receiver deriving his powers from such a court had any right to say that the Reading employees should not belong to the order.

RICHARD OLNEY

I observe that this incident is now quoted by some of his overzealous champions as evidence that Mr. Olney is a strong "friend of labor." In my judgment it proves nothing of the sort, but only that Mr. Olney was then, as he always has been and still is, a strong friend of law, and that he recognized the importance of not letting the courts go wrong if he could help it. The same comment might be made on the claim put in for his labor arbitration bill. The House of Representatives had before it in 1895 a measure providing for the peaceful adjustment of controversies between common carriers and their hired men, and the committee having it in charge submitted it to the Attorney-General for his criticism. He redrafted it in accordance with his ideas of what could be done constitutionally to promote arbitration and get away from the almost universal resort to strikes and lockouts, with their concomitants of violence. Had he been requested to revise a bill designed to promote the punishment of libel by legal process instead of by horsewhip and pistol, he would have performed that function of his office with equal assiduity. That was what he was there for.

Let no one lay the origin of the twaddle published in Mr. Olney's behalf to Mr. Olney himself; nothing nauseates him more. He is not a candidate for the Presidency, and if the party wants him it must come and get him, as President Cleveland did. He would disperse another Coxey's Army as promptly on the eve of a polling as he did when he first entered office. Just as he took his time about laying aside private obligations when he accepted public responsibilities, too conscious of his own rectitude of purpose to care for the clamor of a few agitators; just as, after being assailed for his snobbishness and self-seclusion as Attorney-General, the first thing he did as Secretary of State was to lock the door of his office and station a clerk in the anteroom to sift callers; just as he conducted the Venezuelan correspondence and negotiated the Anglo-American treaty of arbitration, both in the brief compass of eighteen months; just as he condemns American imperialism in the Philippines as brutal and outrageous, but laments our national hypocrisy in not keeping Cuba while we had her; so we may expect to find him, through both the preliminary and the actual campaigns, contemptuous of conventions or consistency when he thinks he is right, and submitting every new question that arises to the test of the law as he reads it, whether the outcome be favorable to himself and his party or otherwise.

Tho having many traits in common, the two dynastic possibilities are in some respect strikingly dissimilar. The spectacle of Cleveland clad in white flannels

and racquet in hand, leaping this way and that to drive a flying tennis-ball back over a net, would make the angels weep; with Olney it suggests nothing incongruous. To send Cleveland on an all day's tramp over the hills for a string of mountain trout when an open sheet of water with a boat is at hand, would add as little to the sum of human happiness as to condemn Olney to sit in a boat all day when there was a rushing brook to ford and rocks to climb. Condemn Cleveland to a cross-country dash on shank's trotters, and Olney to a daily "airing" in a barouche, and you would probably reverse the medical history of the last Democratic administration, when the chief was ill half the time and the most valued subordinate did not learn the taste of medicine.

Both men have what I call the lawyer's mind; but ideas enter Cleveland's through the door of his humanity and submit to the technical test inside, whereas on approaching Olney's they are halted at the porch and made to pass the legal inspection before they get at his inner man. Olney's mind has the elastic temper, rejecting automatically what it is not prepared to accept; you may rain blows upon it all day only to see them bound off, to his apparent indifference. Cleveland's is solid, and any blow that is heavy enough to impress it at all leaves a dent. Cleveland conceives strong likes and dislikes, tastes and distastes, on very meager information; Olney is enough of a cynic to see in the world merely a passing show, about which it does not pay to excite one's self overmuch, and which one can find sufficiently entertaining without becoming embroiled in all its petty interests.

The Open Shop Means the Destruction of the Unions

BY WILLIAM ENGLISH WALLING

[Our readers will remember an article we printed a few weeks ago from Mr. Walling on the great Colorado strike. Mr. Walling is now a resident of the University Settlement of this city, and was at one time a factory inspector in Illinois. As a preparation for this article he attended the last conventions of the Civic Federation, the Citizens' Industrial Association of America, and the American Federation of Labor. He also spent several months in visiting employers' associations from Boston to Denver. —EDITOR.]

THE whole employing class of the United States is lining up for a new campaign against the unions. In this fight it is backed by the press, the middle classes, public opinion generally and the highest labor arbitration tribunal in the country. The struggle is momentous. It will decide not only the industrial but the social and political future of the United States. If the employers' campaign is successful, it means the elimination of the trade unions as a factor in American industry. If it fails, nothing short of direct Government control can prevent the unions' steady progress toward industrial domination.

Employers are almost completely organized for the fight. The public has not realized how much has been accomplished since the coal strike. The organized manufacturers and contractors are no longer alone. They are supported by commercial interests, railroads and banks. Evidence of their co-operation can be seen on every side. In Chicago and St. Louis emergency funds of $1,000,000 are ready for immediate use. The banks, I was told by an officer of the St. Louis Association, are at the bottom of that organization. In Chicago the railroads played a similar part. The Chicago Employers' Association grew up out of the freight handlers' strike. The Chicago, Burlington & Quincy Railroad fur-

nished one of its first organizers and the great commercial interests the other three. Recently a transcontinental railroad conveyed strike breakers from New York to San Francisco at an $11 rate at the request of a powerful employers' association. The movement is spreading from city to city. Since Philadelphia and New York joined the fold a few weeks ago every important city has its powerful federation of employers' associations. Some time ago associations were formed in most of the important national industries, and now every trade which has not already been formed into a trust is organized to deal with labor. All of these associations, local or national, industrial or federated, with one or two exceptions, are moving openly or secretly to force the unions to the Open Shop. But the Open Shop, say the unions, means an open warfare against organized labor.

Until this new issue arose public opinion, outside of the Eastern money centers, was largely on the union side. During the anthracite strike the great majority of newspapers leaned to the miners. They favored the "recognition of the union" and the trade agreement. Under the mistaken assumption that the Open Shop means nothing more than equal treatment for union and non-union men, public opinion has veered around and now stands almost solidly opposed to the organization of labor. Nearly every one of the great city newspapers has become a partisan of the Open Shop. Under their leadership the business, professional and salaried classes and the whole farming community have been lined up in favor of a proposition which, whatever may be said by its advocates, puts the very existence of the unions in the employers' hands.

Employers say the Open Shop means simply even-handed treatment for union and non-union men. Unions say the Open Shop spells their destruction. Why? What is the Open Shop?

Fortunately an official interpretation of the Open Shop has been given to us by the highest labor arbitration court which we have ever had—a court appointed by the President of the United States and accepted by the nation. The Anthracite Coal Strike Commission was not only our most important labor arbitration board, but it has left behind it the most important "trade agreement" in industry. The Commission's award was, of course, in general terms, and first of all provided for an umpire to decide disputes arising under it. Col. Carroll D. Wright, head of the Bureau of Labor, has been appointed umpire.

The Anthracite Commission decided for an Open Shop. In a recent decision that has alarmed and antagonized the whole labor movement Colonel Wright defines the Open Shop as follows:

"There can be no doubt that the employer has a perfect right to employ and discharge men in accordance with the conditions of his industry; that he is not obliged to give any cause for discharge. . . . This right to discharge must be maintained. Any other view of the case . . . would compel employers to employ men whether they had work for them or not, and whether the men were competent or not, and would thus stagnate business and work to the injury of all other employers."

President Roosevelt in his letter of July 14th last, written during the Miller controversy, says, "I heartily approve of the award and judgment by the Commission appointed by me."

President Roosevelt approves of the award of the Anthracite Commission. His appointee, Commissioner Wright, shows that this award has as its very basis the right to discharge without cause. The right to discharge without cause is the feature of the Open Shop against which the unions will fight to the last ditch. The local union of the Mine Workers where Mr. Wright's decision was given was disintegrated through the employers' insidious attacks until finally the National Executive Board, of which Mr. Mitchell is the head, withdrew its charter in disgust.

To admit the right to discharge without cause is, the unions believe, to sign their own death warrant. If the employer can discharge a man "who does not suit him," to quote Colonel Wright again, he can discharge a union man for the simple reason that he is a union man. Nor is the employer's promise not to discriminate sufficient. To fall back on the promise of the employer is to bring the workman back to the same condition of servile dependence he occupied when he had to ask for better wages as an individual favor, instead of demanding them through his union as a right.

The employer who can "discharge without cause" can deprive the workman of his means of subsistence and the union of its members. No organization can continue to exist longer than it is able to protect its individual members from outside attack. For a "labor" organization to protect its members it must first of all keep them at work. To a union man permanently out of a job a union card is a bit of pasteboard and a union agreement for better wages is not worth the paper on which it is written.

The employer who can "discharge without cause" has the power to use war measures in times of peace. By locking out union men one at a time he can wage a quiet war of extermination as effective as and much less expensive than a general lockout. Under arbitration and the trade agreement he can do exactly what he does in an open fight—he can wield against the unions the whole reserve army of labor, the great body of the unorganized and the unemployed.

This is why the unions say the Open Shop is an open fight against labor, and why men like Organizer Fitzpatrick, of Chicago, who put 75,000 members into the unions there in a single year, believe that fire must be fought with fire.

"We favor," he tells me, "the abolition of all agreements and arbitration wherever we have been forced to accept the Open Shop. The employers promised not to discriminate. But they had no sooner begun to adopt the Open Shop than we saw the wholesale discharge of union men. . . . What is the use of having agreements with men who are stabbing you in the back?" The Open Shop agreement gives one of the contracting parties, the employer, power to annihilate the other contracting party.

With the Open Shop discrimination against union men is general, tho often indirect. One of the most eminent and conservative employers in the country told me that he never discharged an agitator who was a good workman at the time of the foreman's complaint. "I always wait," he said, "until the fellow gives me some other excuse." Other discrimination is less veiled. In the Bulletins of the Metal Trades Association are accounts of many employers' movements. Where the Open Shop obtains, the secretaries almost invariably boast of the decreasing membership of the unions. The same men who are openly making every effort to disrupt the unions are the most ardent advocates of the Open Shop.

That discrimination is general is shown by the means employers have adopted to reap the fruits of the Open Shop. Employers' associations are everywhere installing the Employment Bureau. By this means the employees of all the members of an association are registered and their records, including always their records as unionists, are kept. In each shop the employer naturally gives every preference to loyal and obedient non-union men. By means of the Employment Bureau these same loyal individuals may be preferred by the associated employers in the distribution of jobs in the season when work is scarce. The union workmen may find themselves not only discriminated against while employed, but given employment in inverse ratio to their loyalty to their union. The Employment Bureau gives a whole industry the information, the means and the opportunity for discrimination against union men.

Lincoln said "this country cannot remain half slave and half free." The unions have found that an industry cannot remain half non-union and half union. If the industry is already unionized, if all or nearly all the men in it are members of the union, there is no objection to the Open Shop. The unions cannot be broken when there are no non-union men. They cannot be broken if employers agree not to replace union by non-union men and then live up to this agreement. Under such conditions also the unions have no objection to the Open Shop. The making of new converts to the union will soon unionize the trade. The molders employed by the Stove Defense Association have with the full consent of the employers organized all but two of the sixty-four shops. This may not be the union shop, but it is the very thing to which employers object. It is the unionization of industry. Employers are taking a final stand against the unionization of industry by fighting the battle of the non-union men.

"When the unions have 6,000,000 members," says John Mitchell, "instead of 3,000,000, they will be not twice but four times as strong as they are at the

present time." Industry unionized, employers feel, would mean industry in the hands of the unions. The employer would find his occupation gone. No refuge would be left save an appeal to the Government. An appeal to the Government is an appeal to the farmers and the middle class.

Even this might not serve. Doubtless the farming and middle classes would take measures to protect themselves as consumers. But is there reason to suppose that they would be inclined to confer benefits on a class which had lost its economic power?

What is to be the result? One thing is clear. In dealing with labor employers will act as a unit. They have already united on the Open Shop. The Open Shop leads to the Employment Bureau, the Employment Bureau to the National Labor Bureau. The blacklist will be practiced on a national scale. The unions also will act not locally and by separate trades, but nationally and in concert. The sympathetic lockout they will fight with the sympathetic strike. To the national blacklist they will reply with the national strike. Labor conflicts are to become a community affair. The most vital concern of the nation is to be the labor question.

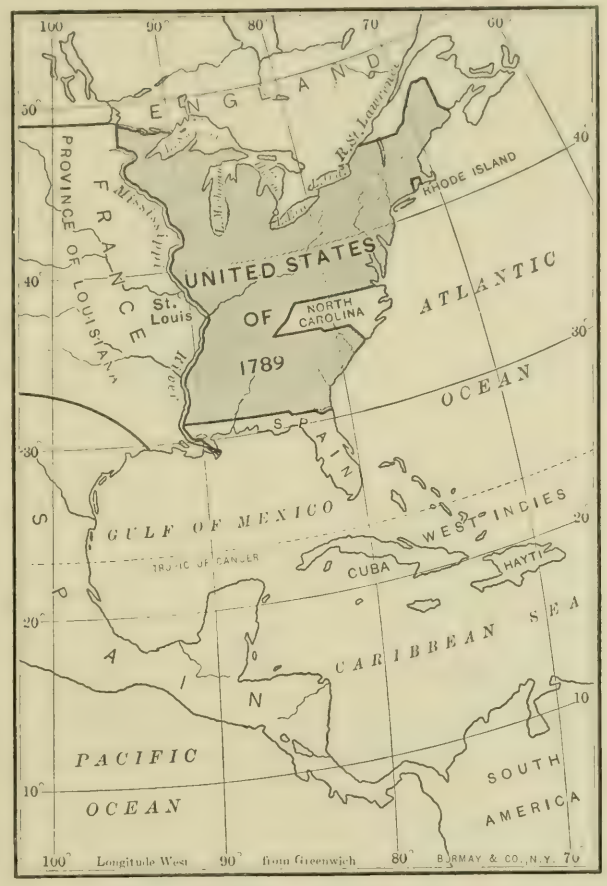
NEW YORK CITY.

The Development of the Union

BY HAYNE DAVIS

[In view of the opening of the St. Louis Exposition last week, the following article by Mr. Davis is of especial timeliness. The questions he brings up are those that will surely attract the greatest minds in every civilized nation in the near future. We expect to print another article shortly by Mr. Davis, telling what is the next step in international relations beyond The Hague Court.—EDITOR.]

IT is an interesting fact that the St. Louis Exposition opened on the anniversary of Washington's inauguration as first President of the United States. When Washington was inaugurated St. Louis was in France. When the Exposition opened April 30th, 1904, only one hundred and fifteen years later, St. Louis is in the center of the United States. This fact alone bears witness to the wonderful changes which a century, under present conditions, may be expected to bring forth. Taken in connection with the steps in the development of our Union, this fact is more than interesting, it is prophetic.



Before 1776 the land of America was owned by England, Spain and France. Our Declaration of Independence followed by the Confederation of the Colonies brought into being a new political organism, formed by union of the revolted portion of the British possessions, and actually contiguous to England, France and Spain.

The formation of this Confederation by the Union of a few sparsely settled States, covering only a small portion of North America, seemed to European nations a matter of small concern to them. But no political event of greater moment to them ever took place. One provision of the first Constitution of the United States (The Articles of Confederation), was that the Union should be perpetual and no change made in its Constitution, except by unanimous consent of all the States. Nevertheless, the Constitutional Convention of 1787 decided that a union of nine States under our present Constitution would be better than the union of all the States under the Articles of Confederation. Consequently, when the ninth State ratified the Constitution (New Hampshire, June 21st, 1788), the present Union was formed, and the Constitution became operative, tho Virginia, New York, North Carolina and Rhode Island were not included in the Union.

After the formation of the Union without Virginia, North Carolina, New York and Rhode Island, these States were free to come in or remain out as they might

prefer. Virginia entered the Union four days after the vote of New Hampshire formed it. New York came in a month later by a bare majority of two votes. Then followed the election and inauguration of Washington as President, thus constituting the United States an acting as well as an actual organization, tho North Carolina and Rhode Island were still not in the Union.*

The substitution of the present Constitution, tho not adopted by all the States, for the Articles of Confederation, which bound them all together, gave temporary life to the idea of a division among the original States, but the incomplete Union lasted only thirteen months; for seven months after Washington's inauguration North Carolina came into the Union, and Rhode Island followed six months later. The entry of Rhode Island into the Union, on May 29th, 1790, three years to a day after the assembling of the Constitutional Convention, made them all one again, and the idea of several governments for our Atlantic seaboard seemed finally dead. But this idea was still alive in the minds of some, and seventy years later took form in the Confederate States.

This map shows what part of North America was included in the United States, of which Washington became President, in 1789. The Union as then constituted was bounded by England on the north, France on the west, Spain on the south, with North Carolina and Rhode Island not in the Union.

If Virginia and the States south of her had failed to adopt the new Constitution, as they might have done, the territory which seceded in 1861, would have been left out of the Union. In forming the Union this was contemplated as a possibility, and was considered more desirable than the unsatisfactory union of all the States, then existing under the Articles of Confederation. A few decades made such changes in the ideas of men, that, in 1861, no price seemed too much to pay to prevent the separation of some of the States, tho in 1789, it was agreed by twelve of the thirteen States, that if nine of them preferred the present Constitution to the Articles of Confederation, the other four could remain out or come into the new Union, as they might prefer. In the ruin of the Confederate States the deathblow was given to the idea of several governments on the Atlantic seaboard. There really was not room enough between the two oceans and the Great Lakes and the Gulf of Mexico for more than one sovereign political power, and yet our forefathers contemplated several confederations for the land east of the Mississippi River. What was desirable to us, and this change has come about in less than half a century.

The idea of a Union of Nations must go through substantially the same development as the idea of a Union of our States. This has already begun. The Conference at The Hague gave birth to a feeble Union of Nations, in which is included all the nations of the world, except those of Central and South America.

The Treaty of The Hague is really the first Constitution of the United Nations,

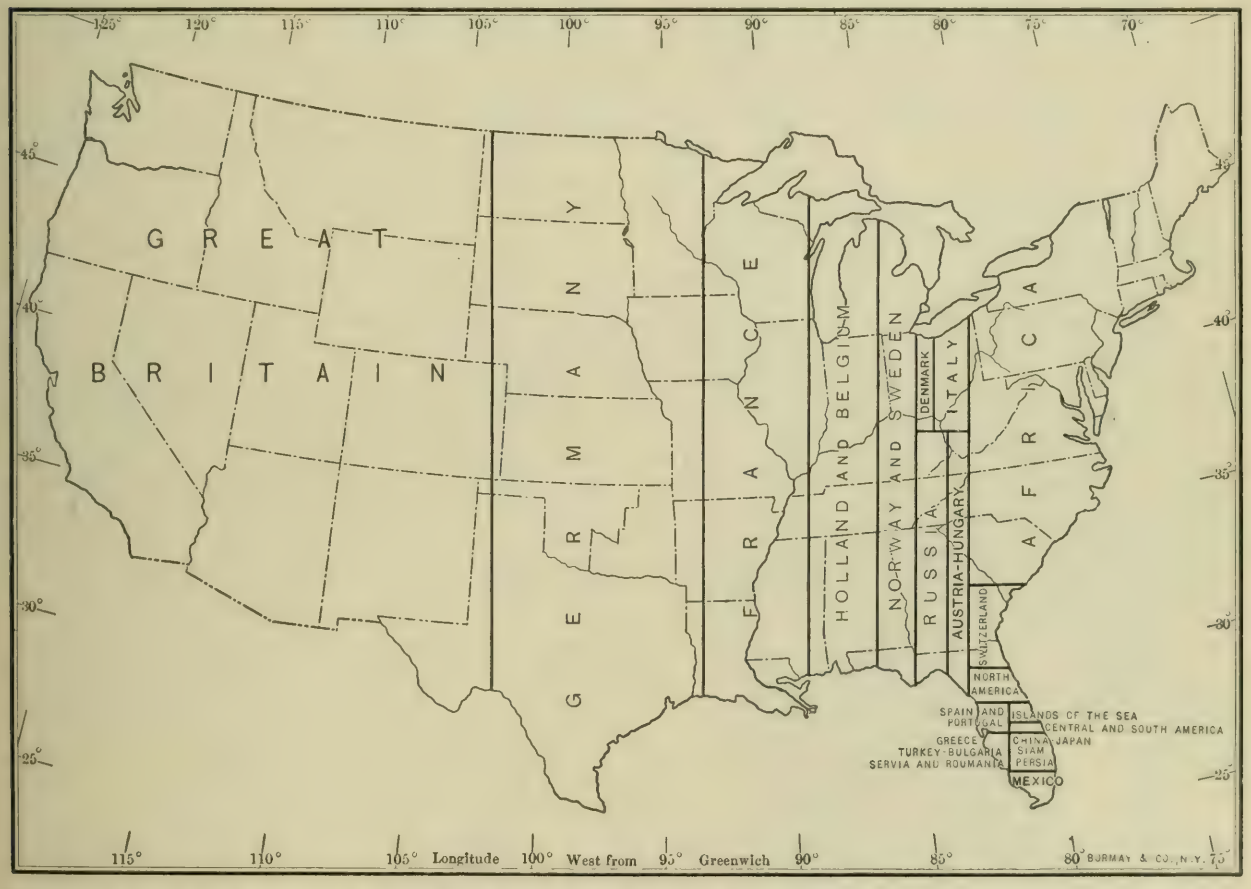
* In view of the provision that the Articles of Confederation could be changed only by unanimous consent, and of the fact that one State, Rhode Island, was not represented in the Constitutional Convention of 1787, how could the Union, under the Confederation, be dissolved legally, without the consent of every State, to enter the new Union?

as the Articles of Confederation was the first constitution of our Union. And as our first Union was hopelessly inadequate to the needs of the people of America, so the present Union of Nations is hopelessly inadequate to the needs of the people of the world. And, even now, the same unrest which carried us into the present Union is being manifested throughout the world.

A United States of Europe is conceived by some as the proper outcome of present conditions. The Federation of the British Empire is planned by Chamberlain, and has long been a pet idea with eminent Englishmen. A union of England and America into one English speaking empire seems to be the largest political conception of Cecil Rhodes, Mr. Stead, Lord Derby and others. But all these are too narrow for the times in which we live, and they correspond to the nineteenth century idea of New England, Middle State and Southern Confederacies for this country. A Universal Union is called for by present conditions, and it should come by admission of all nations into the existing feeble Union of Nations and then by its gradual growth in power.

The United States of 1904 is in closer touch with every nation than the United States of 1776 was with any nation, for actual travel.

This map shows what part of the world is included in the United Nations, when first organized by the establishment of The Hague Court. Only Central and South America are out of this Union.



The distance and time between St. Louis and various points throughout the world, and the ease with which this journey can now be made, are illustrated by the following table:

Distance to St. Louis from—	Time. Days.	Hours.	Distance. Miles.	Ordinary cost of passage.
London	7	3	4,257	$130.50
Paris	9	3	5,077	111.20
Lisbon	11	3	6,392	180.50
Cape Town	..	..	....	193.50
Cape Town via London	28	3	9,156	314.50
Delagoa Bay via London	31	3	11,268	333.50
Bombay via London	25	3	10,832	513.50
Sydney	29	7	9,594	254,25
Yokohama	19	12	6,862	197.50
Manila	29	12	9,937	229.25

It would have taken as much time in the colonial era to go from any Atlantic port to St. Louis, as it now does from

any port in any nation to that city, and thought can be communicated almost instantly from one national capital to any other. The flow of people and commerce from nation to nation exceeds the interstate intercourse of a hundred years ago. The volume of intercourse between governments is an index to the interests which they have in common. Therefore, nations have more interests in common at the dawn of the twentieth century than the American States had in the twilight of the eighteenth.

As the United States grew in material area by acquisition of the land of other nations, so it grew in population—in living area, one might say—by receiving streams of people from every race and nation. To the extent that Germans and Frenchmen and Italians, and people of other nations have become a part of our

This map gives each nation or section of the world space in the United States proportionate to its contribution to our population, but without regard to where the people of each nation have settled in America. It strikingly reveals the extent to which the negro is a part of our life, as well as the proportionate representation of each nation in the United States.

population, to that extent has the United States incorporated living Germany, France, Spain, Italy, etc., into itself.

If the people of all nations can be uprooted and transplanted in another land, and there form themselves into one political organism, with many members, the nations can successfully form themselves into one political body. The vital point is to limit the new authority to those affairs which are common to all nations, thus leaving each nation as supreme in its own domain as it now is. This principle of Home Rule or Local Self-Government works wonders in human affairs. The United States has demonstrated, or, rather, the races of men have demonstrated in the United States, what can be done when all sorts and conditions of men are united in one political body, organized on the principle of Home Rule. All that has been done in America has been done by people from other lands, operating and co-operating here, on the right political principle. What the people of all nations can do for themselves in the conduct of their American interests they can do in the conduct of their world-wide interests, provided they act on the same principles in international affairs as in their interstate affairs. The greatest political work

of our time seems, therefore, to be the destruction of the idea that several international unions ought to be formed, and the strengthening of the Universal Union already formed, so that it may become adequate to the needs of humanity, as our imperfect and inadequate Union under the Articles of Confederation gave place to the present perpetual and adequate Union.

For the nations to continue long in the present condition would be an international counterpart of America's remaining under the Articles of Confederation, instead of adopting the present Constitution. For a nation to hold back, when others go forward, would correspond to the reluctant entry of North Carolina and Rhode Island into our present Union. The refusal of any nation to join in making the Union more perfect would be equivalent to a rejection of the Constitution by an American State.

The Treaty of The Hague provides that any nation, by giving one year's notice, may withdraw from the Treaty, or, in other words, secede from the union created by the Treaty. This being true, why should there be any hesitancy in developing this union and giving it suitable powers? Secession of some members after making it stronger could only result in the formation of one or more narrower unions. And the proposed United States of Europe or Anglo-American Empire would do this. These narrower unions, whether formed by secessions from a Universal Union or in advance of any alteration in the Treaty of The Hague, would be a prelude to war. But the least danger lies in developing the Universal Union formed by the Treaty of The Hague. With the right of secession expressly stated, war would not result, as with us, from attempted exercise of this right. And the mutual interest of nations would work powerfully against an exercise of the right.

The best interests of the people of every nation require the extension of the Union of Nations so as to make it Universal, and its orderly development so as to preserve the peace and promote the prosperity of the Nations, rather than the formation of narrower unions, destined to come into conflict and then be united, as the narrower unions of America did during the past century. The orderly steps in the development of this Universal Union are (1) admission of States not signatories of The Hague Treaty; (2) the submission of international disputes to The Hague Court, as they arise; (3) agreements between particular nations to arbitrate certain agreed classes of controversies; and (4) the creation of a deliberative or legislative body to supplement The Hague Court. This last step requires the concerted action of many national legislatures, but some nation must lead in taking this step. And the United States is the one to do this, by inviting the other nations to join in a Conference to consider the matter. Such a Legislature once created, this political child of the centuries can grow naturally in stature, wisdom and usefulness, and in favor with all the Nations that took part in its creation.

NEW YORK CITY.

My Last Day

BY JOHN PIATT

How far, how near?—what mortal eye may see?
How dark, how bright?—that Day far-fixed for me.
Enough, whene'er it dawns, if I can say:
"Let the sun rise—it brings me my Last Day."

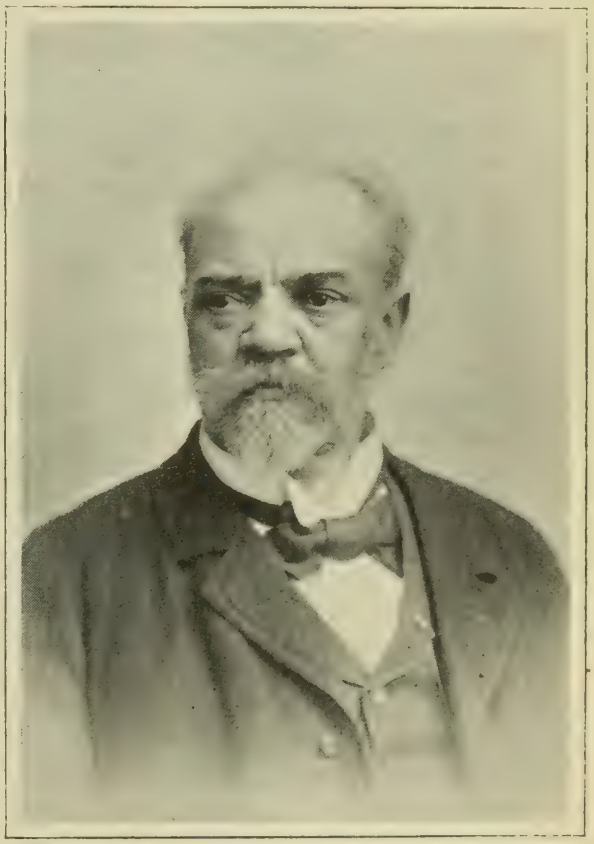
NORTH BEND, O.

Music, Art and Drama

The Cincinnati Festival

No other chorus works with the devotion shown by the Cincinnati Association, which rehearses two years for each festival. This event takes place this year from May 11th to 14th, and its success seems assured by the coalition of the ablest orchestral conductor and manager in the country. Theodore Thomas brings his orchestra of 100 from Chicago, while George H. Wilson, of Pittsburg, is the power behind the baton.

Perhaps no other movement, since the inception of these festivals in 1873, has epitomized so well the evolution of American art. And it is pleasant to know that no German city surpasses Cincinnati in the dignity of a parallel musical achievement.



Antonin Dvorák

Like Antoine Watteau, Antonin Dvorák, who died May 1st at Prague, in his native Bohemia, had his childish talent first stimulated by the wandering musicians and strolling players that he saw from the window of his home. Painter and composer, moreover, each retained to the last his predominating interest in *genre* subjects.

Both came of peasant stock and both narrowly escaped following the parental calling; Watteau's father was the seventeenth century equivalent of a plumber, at Valenciennes, while Dvorák senior was village innkeeper and butcher at Mühlhausen.

But here the parallel ceases. Watteau kept his love for typical figures of his period, but his countless chalk drawings and paintings were mainly of folk in the great world; of these he has come down as the chief interpreter. Dvorák remained a man of the people, in mind and heart, tho he, too, ultimately found prosperity. His creative work as composer was deeply affected by this obstinate survival of what was, be it said, both his strength and his weakness—his tenacious peasant nature. Watteau came to speak a universal tongue; Dvorák's Czechish idiom is often provincial and occasionally barbarous. Even after his three fruitful years in New York (1892-95) as head of the National Conservatory Dr. Dvorák harked back to his racy mannerisms, upon which, indeed, depend much of the delightful gayety and charm of his music. And never, perhaps, did his intellectual power, his grasp as a designer in the large, keep pace with his remarkable flow of cheery and not always significant melody.

Whatever the opinion of his effort to base a national American school of music upon plantation negro melodies, as our nearest approach to folk song, the vital qualities of his fifth symphony,

ANTONIN DVORÁK

"From the New World," will keep it in the active repertory for some time to come. It is frankly external in its fresh naïveté and it moves buoyantly from mood to mood, expressing at least one phase of the American temperament, but not penetrating deep. Dvorák must be enjoyed for what he was—and he has already given pleasure to thousands of music lovers.

Elgar's "King Olaf"

In Dr. Edward Elgar England has at last produced a musician whose compositions are of sufficient importance to arouse interest beyond the confines of the "Right little, tight little Isle." Inasmuch as her musical activity for nearly two hundred years has been given almost exclusively to the "oratorio industry," it is only natural that this new leader of light and learning should chiefly devote himself to the composition of choral works. And that is what Dr. Elgar is doing. That he is doing it with rather more conspicuous success than any other living composer New York has had ample opportunity of hearing for herself in the course of the last fourteen months, for within that time have been produced here four of his most important works: "The Dream of Gerontius," "The Light of Life," "The Apostles" and "Scenes from the Saga of King Olaf."

The last named, a cantata of unusual length and ambitious proportions, had its first American performance at the hands of the Brooklyn Oratorio Society, in Carnegie Hall, on April 29th. This "King Olaf" has a more than passing interest for American audiences, in that it is founded on the work of an American poet. Its material is drawn from "The Musician's Tale," in Longfellow's "Tales of a Wayside Inn." Nearly one-half of the text is in the words of Longfellow. The rest is by an English adapter, one H. A. Acworth. The musical setting is for soprano, tenor and bass soli, chorus and orchestra. The episodes chosen for musical treatment are "The Challenge of Thor," "King Olaf's Return," "The Conversion," "Gudrun," "The Wraith of Odin," "Sigrid," "Thyri," and "The Death of Olaf," besides an introduction and an epilogue. The treatment, partly epic and partly dramatic, is seized upon by the composer to produce some vigorous and stirring music, and also some musical characterization in the Wagnerian style. Indeed, the work impressed one as being chiefly remarkable for the application to the cantata form of Wagner's methods and principles. "Leading motives" are employed to represent the characters and the principal agencies, physical and spiritual, and they are handled with skill. The orchestration is often clever and sometimes convincing. There is much skill displayed, too, in the choruses, which have a vigorous swing and a certain gloomy Northern color appropriate to the subject. The many solo parts grow somewhat monotonous before the end is reached.

Pictures from Japan

In rather a dull year for the picture lover the best was saved for the end of the season. The Century Association showed in April fifty-two paintings on silk by two Japanese moderns — Taikan-Yokoyama and Shunso-Hishida, of the Nippon Bijitsuin, or Fine Arts Academy—that made Western efforts to fix impressions of beauty in nature seem like mere blind gropings. The catalogue of the exhibition had a few notes on the aims of the school in which these two painters are professors, and told of the interesting system of free instruction and exchange of criticisms and ideas among its three hundred members. The school is a protest equally against the Europeanized art movement favored by the Government and the purely conservative movement of the pseudo-classicists in Japan. It seems to be a sort of romantic movement, if we may compare it with our own art development; a protest against archaic affectations and mannerisms on one hand and the sacrifice of the national point of view on the other. The pictures shown were landscapes, marines and flowers, with the exception of one figure picture.

The first impression of these delicate dreams is of their finality. Except in representations of the human figure every essential truth in form and value

is preserved. The monkeys on the rocks in one picture, the wild ducks and small deer or birds or fishes in others, are perfect in drawing, color, characterization. How could there be anything further to say about animals in a use of them for pure esthetic effect? In foreshortening of surfaces, in aërial perspectives attained through marvelously subtle gradations of tone, these Japanese artists are masters. There are no crudities, no fumbling methods, no mistakes in taste. The human form alone is still beyond them, if we may judge the possibilities of their attainment by their use of animal forms. In treatment of it they still miss values and fail to incorporate it in the general harmony and use an opaque white that obtrudes. Most Japanese excel in composition; these works are fairly Greek in attention to the little beauties that give soul to the perfected whole. That we respond to the color stimuli which they so subtly put forth in a set of values very high in our own color scale is due rather to the cultivation of our color sense through the beauty in old textiles and dawns, misty twilights and the shades of flowers, than through what European painting has taught us from first to last. "The Daybreak" and the "Returning Ship," by Hishida, make any painter of the West, less of a poet than Twachtman, seem blind to harmonies of color, and a glance from those two works to any others by the same artist at once suggested the idea that each of our own men is bound to a smaller set of individual color conventions than we often realize. Aside from type of subject or any strong mannerism it is generally possible to pick the work of a Western painter instantly by the prevailing hue. With these two Japanese painters color is far more than anything else a matter of significance. The prevailing hue expresses the mood represented, the mood of nature, not the mood of the man. Probably a Japanese critic would distinguish between the works of these two men through some subtler differences than those in color, but a Western observer would find it a task to do this. "The Sea," by Yokoyama, gives a glimpse of a naturalistic view of nature, but "The Waterfall" and others by Hishida have similar characteristics. In pictures of trees under various atmospheric effects, in a general color warmer than of old, and in perfect grasp of perspectives, European influence is shown; but in selection of subject, precision in detail, where detail is used, and the very past-mastery of water-color as a medium for conveying most delicately restrained emotional appeal, this "new Old School of Japan" is faithfully preserving what its nation has most happily given to the world of beauty.

Other Exhibitions of the Season's End

Nothing in painting could be more directly the antithesis of the Japanese in vision and rendering than the works of Mr. Perrine, shown in April at Durand-Ruel's. Like them in power of subordinating what he does not need for his purpose, he is different in even the dominant personality of his work—a personality that has a certain kind of manly violence of much beauty. One would suspect temper from the unnecessary little plate on "The Robbers," bought by Carnegie Institute, calling attention to the fact that the Society of American Artists had rejected it. But Mr. Perrine may be forgiven lapses in taste for the value of his convictions. The Palisades as he makes us see them are the creations of forces we do not often face squarely in thought; the overpowering, the eternal, majestic and awful, evolved to rugged, many-sided actuality from chaos. The pictures are sad because they give us the shock of coming upon the unknowable things suddenly—in the night and with a great city so near—but they are not morbid and they belong to this particular day when we are well into a new and original century in art.

Even less interesting than the earlier exhibition of the Water Color Club is the annual exhibition now on in Twenty-third Street. Why most of the exhibitors use water-color at all is a matter of wonder. Labored, heavy color that kills all intrinsic value in the fluid medium, silly or ineffectual figure subjects and very weak landscapes are in evidence in the collection. There are a few exceptions among the general weary mediocrities. Parton's "Moonrise" is one. It is sim-

ple in arrangement of mass, has good color and an interesting sky. Charlotte Coman's "Mountain Mist" is another. It has a pleasant surface as well as depth in color and strong drawing of a delicate kind. Dangerfield's "Deluge" is a serious painting not unlike Böcklin in color and force. It is one of the best things here. Glenn Newell's "Toilers" is good solid work and more of a picture than most of the others. Cullen Yates has two excellent landscapes. In four works Carlton T. Chapman has taken to the decorative and gives us most effective yachting pictures in strong sunlight and shadow. C. C. Cooper paints the "Flatiron" building on a wintry day and gives it the swaying shiplike look it has on an approach from north Fifth Avenue. Two little heads of children by Laura Muntz are good in color. Louis Mora's "Cotillion Favors" is the only figure picture worth noting, and about it there lingers the serious student's manner this young man has not yet outgrown. Mrs. Nicholls, as usual, shows a truer understanding of use of color washes than most of the others.

The Grolier Club exhibited last month part of a very complete collection of Whistler's etchings and dry prints—the remainder will be shown in the autumn. To enjoy a Whistler more or less because it is a print, "Before the Butterfly," or "With the Butterfly," or "With Butterfly Shaded," is a privilege attained only through formation of the collector's habit. This exhibition appealed particularly to that class of persons, but it was also an opportunity of seeing many rare designs by this great master etcher.

Arts and Crafts

One of the most interesting of the recent exhibitions was that given for a fortnight commencing April 7th at the Windsor Arcade by Angelo del Nero. The feature of M. Nero's exhibit lies in his masterly reproduction in bronze, gold and silver of classical fourteenth century pieces. Professor Nero, by means of analysis, has ascertained the constituent elements of the Italian soil from which the antique bronzes have been excavated, and which are covered with the patina so dear to the collector's heart. By augmenting the corrosive elements revealed by analysis he has succeeded in producing patina in a few weeks that it took centuries of burial to duplicate. Some of his castings in bronze from live lobsters and other zoological forms are singularly beautiful as well as realistic. His pres-

Moonrise.—Arthur Parton. In American Water Color Society Exhibition.

ent exhibition is both serious and artistic and deserves the most careful consideration.

The Month's Important Plays

The play of "The Shepherd King," which has just finished a successful season in New York, was an interesting and attractive presentation of the romantic early life of David as described in the Bible. Few plays have recently been produced more worthy of serious attention. The subject is inherently dramatic. The story has been reproduced with an appreciative spirit. Mr. Wright Lorimer, the author, acted the title-role admirably and was excellently supported by a very competent company. The incidental music, which was especially composed for the play, and intentionally made to harmonize with the simplicity of early Hebraic music, was unusually fine. All the scenic effects were good, and every feature of the production was characterized by extreme care and attention to detail. So far was this carried that a special drop curtain, made of tapestry ornamented with designs in the life of David, was provided. The entire production was a brilliant picture of early Oriental life, reminding one frequently of the production of "Ben Hur" in New York last year. Mr. Lorimer in this work has shown that he has set for himself a high standard, and his work deserves cordial public support. It is an instance of a play on a Biblical subject which has a seriousness and nobility of treatment appropriate to the subject, and which is presented in a manner equal to the highest achievements of modern dramatic production.

To castigate vices and follies, small or large, is not so much the object of the comedy of to-day as it was in that of Aristophanes. In fact, in the play "Saucy Sally" at the New Lyceum we are expected to laugh over the peccadilloes, if one may call them so, of the graceless "Herbert Jocelyn" as he pulls himself out of scrape after scrape with his typical mother-in-law and his confiding wife. If he were twice the rascal that he is he would make his way into the good graces of the audience by his most ingenious and, one may almost say, delicious twists and turns, helped out by the inimitable "wreathed smiles" of Charles

Hawtrey. The play is decidedly worth seeing.

The "Two Orphans" was revived last month at the New Amsterdam Theatre with an all-star caste, in which such well-known players as Kyrle Bellew, Grace George and Clara Morris were among the principals. The play, which is one of the best melodramas ever written, was superbly presented and acted, tho it does not seem at this date to appeal to the emotions as it used to years ago. In the old times the whole audience would sob at the cruelty perpetrated on the blind orphan, while now scarcely a sniffle is heard. The play will always be worth seeing despite its archaisms.

Julia Marlowe in the dramatization of Charles Major's "When Knighthood Was in Flower" gives an excellent interpretation of Mary Tudor, with her fits of anger and hoydenish frolics, alternating with scenes of affection and self-sacrifice. However far the Princess Mary may be from her historical prototype, she has so many traits in common with the modern girl as to captivate her audience.

The Rank of the Season's Plays

The dramatic season in New York is nearly over. It may be interesting to review the work of the winter, and to record our estimate of the comparative excellence of the different works presented. In our opinion the best dramatic productions brought out in New York this winter, and their rank in merit, are as follows:

1. Most of the German and Italian operas at the Metropolitan Opera House.
2. "Hamlet" by Forbes Robertson.
3. "The Merchant of Venice," "The Taming of the Shrew" and "The School for Scandal" by Ada Rehan.
4. "As You Like It," "Twelfth Night" and "She Stoops to Conquer" by Miss Matthison and Mr. Greet.
5. "Much Ado About Nothing" by the Century Players.
6. "Dante" by Sir Henry Irving.
7. "Ulysses" by Tyrone Power.
8. "The Admirable Crichton" by Mr. Gillette.

Wright Lorimer in "The Shepherd King."—Climax of Act II, The Slaying of Goliath

9. "Merely Mary Ann" by Eleanor Robson.

10. "Old Heidelberg" and "Ivan the Terrible" by Richard Mansfield.

11. "The Shepherd King" by Wright Lorimer, "Sweet Kitty Bellairs" by Miss Henrietta Crosman, "Captain Dieppe" by John Drew, "Ranson's Folly" by Robert Edeson, "The Pretty Sister of José" by Maude Adams.

Very high commendation also should be given to the Murray Hill Theatre for usually producing excellent plays, with frequent changes of the bill, by a competent company, at a very cheap price.

The Timber Wolves

BY HERBERT IVAN SWIFT

We are the wolves o' the timber land—
Me an' the black an' the bay!
We work by the day for a pittance o' pay,
Pork for the man, an' the horses' hay!
"Slaves!" you say?
"O' the skid an' the sleigh!"
It's the echoed word
O' the world you've heard;
For the nags an' me,
Are the wind an' the tree—
And none so free!—
We're czars o' the lumberin' band!

We sound for the sun his reveillé—
With the clank o' the loggin'-chain,
An' the bitin' pain o' the frost disdain!
We warm to the work and won't complain.
Chuck your Florida flowers!—
Michigan woods for ours!
Hills o' snow and a hammerin' bell!
Four thousan' scale as hard as shell!
Get up, Jack!—Together, Nell!
Break your tugs!
Shake your lugs!
Your frozen steam
Is a Cuban dream,
When you sleep in the straw with me!

The "slaves" are rollin' the logs o' towns!
Give 'em the card they've drawn!
The blood an' brawn, an' the liquor o' dawn
Are enough for us, we're up an' gone!—
A ten-league run
Is a race with the sun!
The horses' keep,
And a cave for sleep—
(Better a bear than a shiverin' sheep),
Meat an' bread,
And a blanket-bed;
An' the prayers for more we leave to clowns.

To the hags o' storm my song is hurled!
My poem's the creak o' the hick'ry rack!
The lash's crack, in the woods rung back,
Is a fire in the veins o' the bay an' black!
How they dance,
And heave an' prance!
Oh, wild an' free,
We're comrades three,
Born o' wind an' wave!
Little to lose or save—
What o' the grave?
The boss of care is the king of the world!

HARBOR SPRINGS, MICH.

Literature

The Jessica Letters

"LETTER WRITING must be counted among the lost arts." "Penny postage has killed correspondence." Such judgments as these passed current without challege not many years ago; just at the time when those letters were being written which, now published in memoirs, are delighting the world; just before the present recrudescence of epistolary romance. There is no reason to doubt that there are now as much as there ever were interchanges of good letters, real letters, self-revelatory and mutually analytical, such, in short, as *The Jessica Letters.**

Of course, the first question which arises in the mind of the reader is whether these letters are genuine or only a fictional form. It is obviously none of his business and, in this as in other anonymous correspondence recently published, it makes no particle of difference to their value or interest. Nevertheless, the reader "wants to know," and, not knowing, finds pleasure in guessing. It would take a higher critic than the present writer to separate the original documents from the work of the redactors; still we are convinced by purely internal evidence that original documents there were, notwithstanding the ingeniously worded preface wherein the authors ostentatiously lay aside their masks. These masks are of gauze, not *papier maché*, and they accentuate rather than disguise the features of their wearers. It is too much to ask us to believe that the passion and tenderness expressed in some of these letters are altogether fictitious.

One of the favorite pastimes of the Hôtel de Rambouillet in the seventeenth century was the drawing of maps and the location of the boundaries of "Le Pays de Tendresse." In somewhat similar way we have the love-land of the twentieth century geographically described in recent letters. It is bounded on the east and the west by the "Kempton-Wace Letters." It is bounded on the north and the south by the *Jessica Letters.*

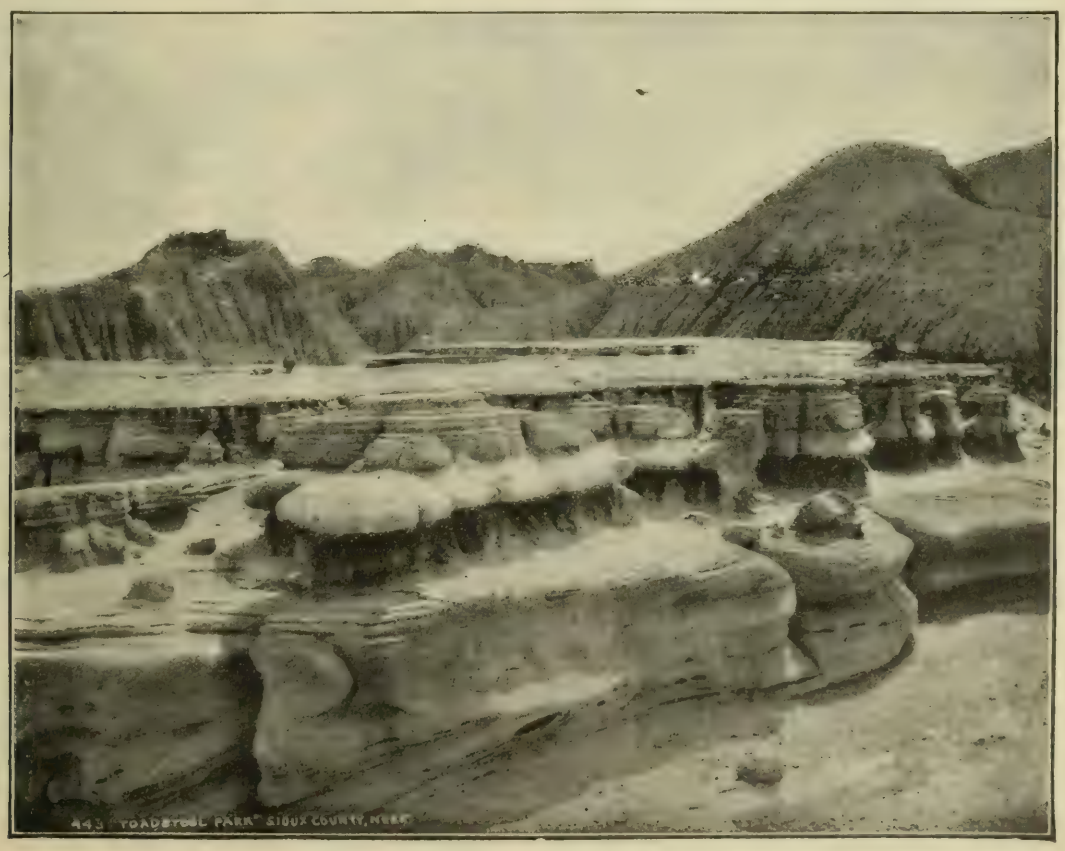
Philip and Jessica are opposites, not merely by reason of sex, but in every other way as well, and the chief interest of the book lies in the way in which the passing show of life and letters is interpreted by such different temperaments. In Philip the natural coldness and self-restraint of the Northerner have been stiffened into greater severity and conventionality by his classical training and his profession of critic. Even his deep and earnest love causes no tremors in his literary style. Jessica is the typical Southern woman, in whom all distinctively feminine traits are intensified and, perhaps purposely, exaggerated. She is rash, repentant and romantic. Altho in preparing the copy for the press her dropped r's are restored, any one could tell that she is Southern by many peculiarities of style, such as the constant use of the word "lady." Philip treats the English language with the greatest respect. He would not venture to use a word in a sense for which he could not quote an authority at least as far back as the seventeenth century, Catullus preferred. Jessica plays ball with her words and they bound and strike in the most unexpected places. The book is one to delight the distinctively "literary reader."

The book ends happily. Or, to speak more exactly, the lovers are united, and it is a question how well two temperaments so dissimilar and apparently incompatible will agree in the closer relations of married life. It may be that a second installment of their letters will appear some years hence; this time in the newspaper reports of the divorce court. The plot is no more complicated than plots are in real life; the most serious obstacle the lovers have to overcome is the old-fashioned loyalty of Jessica to the old-fashioned objections of her father.

Apart from its interest as a romance and as a portrayal of personality, the book has value on account of its criticism of modern social and literary tendencies. Philip is not at all in harmony with the dominant movement of the times, which gives almost exclusive importance to the material improvement of the laboring classes, as the following quotation shows. A man who nowadays dares put the elevation of the masses into the subjunctive

* THE JESSICA LETTERS. *An Editor's Romance.* New York: G. P. Putnam's Sons. $1.10.

mode is sufficiently unusual to merit attention.



"I have tried to show how from one ideal to another mankind has passed to this present sham ideal, or no-ideal, wherein it welters as in a sea of boundless sentimentalism. I have tried to show that because men to-day have no vision beyond material comfort and the science of material things—that for this reason their aims and actions are divided between the sickly sympathies of Hull House and the sordid cruelties of Wall Street. And I have written that the only true service to mankind in this hour is to rid one's self once for all of the canting unreason of 'equality and brotherhood, to rise above the coils of material getting, and to make noble and beautiful and free one's own life. Sodom would have been saved had the angel of the Lord found therein only ten righteous men, and our hope to-day depends primarily, not on the elevation of the masses (though this, too, were desirable), but on the ability of a few men to hold fast the ancient truth and hand it down to those who come after. So shall beauty and high thought not perish from the earth—'Doing righteousness, make glad your heart!'"

A New Geology

In this book * of nearly 650 pages we have the first volume of the long promised work on geology from these authors. The result seems to have been worth the waiting. While no book can ever take the place of Dana's Manual of Geology as an authority and a source book for work in American geology, there has long been a need for a book that should unite comprehensive treatment with a more interesting and readable style. The names of the authors guarantee the accuracy of this work, and the first volume is evidence of their ability to present scientific material even of a technical character in a most interesting form. The book has been written with its usefulness to the student constantly in mind; perhaps the most striking characteristic of the work is the evident sympathy that exists in the minds of the authors for the beginner in geology. The words of the authors in their preface may be applied to the general reader as well as to the technical student:

"Throughout the work the central purpose has been not merely to set forth the present status of knowledge, but to present it in such a way that the student will be introduced to the methods and spirit of the science, led to a sympathetic interest in its progress, and prepared to receive intelligently and to welcome cordially its future advances. Where practicable, the text has been so shaped that the student may follow the steps which have led to

* Geology. *By T. C. Chamberlin and Rollin D. Salisbury. Vol. I. Geologic Processes and Their Results.* [American Science Series, Advanced Course.] New York: Henry Holt & Co.

Erosion in the Arid Region. From Chamberlin and Salisbury's Geology. Henry Holt & Co.

present conclusions. . . . In these and other respects the purpose has been to take the student into the fraternity of geologists, and to reveal to him the true state of the development of the science."

In general, the plan of the work differs much from that of previous books; instead of treatment under the various heads of dynamic geology, stratigraphic geology, physiographic geology, etc., the authors have grasped the fact that to beginners and laymen the science of geology is essentially a history of the earth and they have planned their work to present the various forces of the earth as elements in its developmental history. In the first chapter is given a discussion of the earth in its planetary relations, and of the three envelops of the earth, the air, water and solid land; the dimensions, relations and interactions of the three envelops are outlined and form a basis for the more detailed discusions of the rest of the book. Chapters II to VI are concerned with the action of the atmosphere and water (rivers, underground water and ocean) on the land. Then a chapter on the origin and classification of rocks, followed by chapters on structure and deformation of the rocks, volcanic and earthquake activities, etc. The final chapters deal with the relation of life to the earth and pave the way for the second volume.

Especial attention is paid in the first part of the work to surface agencies in the development of valleys and land forms in general, and the material is presented with a wealth of new suggestion and illustration that is very attractive. The same may be said of the chapter upon Ice Work, where the long labors of the senior author have permitted him to speak at first hand. Perhaps very few men who have learned the older classification of rocks on the mineralogical basis will be willing to take up the suggested classification based on the chemical composition of the rocks, with its great number of new terms, but this may perhaps be adopted by the new generation of students. Nowhere in the book have the authors hesitated to put forth new theories and to depart from the traditions of geology, but there is also no lack of good argument to support the theories.

The class of illustration is especially to be commended; there has been no use of hackneyed plates and diagrams. The subjects are well chosen and the execution is of the first order. A large number of maps and portions of maps have been taken from the publications of the United States Geological Survey, and printed in the original form and colors, serve not only to illustrate the points made, but to familiarize the student with such publications. The public as well as the authors and publishers are to be congratulated on the appearance of the book.

Seven Novels

Now that war in the Orient has attracted particular attention to Russia, *The Fugitive** will be read with interest, since it is an exposure of some Russian characteristics that are evidenced even in her relation to the Manchurian situation. This, however, is the story of a Russian Jew, "in search of a home." From it we gather that Slavonic persecution is singularly unenlightened and brutal, and would indeed be unendurable to any but Jews, who have had a long experience in bearing the cruelty of Gentile Pharisees. But the really notable feature of the book is the explanation it contains of the Jewish temperament—not an excuse or a plea for him, but a revelation of the very heart of Israel. Considered in this way the racial traits popularly charged against the Jew become explicable. His cowardice becomes the natural shrinking of a sensitive and artistic temperament, of which he is no more ashamed than a woman is of her timidity; his greed is a pathetic self defense, and his superstition is an ancient but still splendid mysticism. All of which is dramatized in scenes that are native to Russia, the squalor of the peasant, the perjury, license and bribery of the Government official, and surviving all, the softly unscruplous Jew. But passing through these familiar phases of development the young hero, who bears a remarkable psychic likeness to the old prophets, so entirely has he been nourished spiritually and intellectually upon Old Testament Scripture, is brought suddenly face to face with the modern world

* THE FUGITIVE. *By Ezra Brudno.* New York: Doubleday, Page & Co. $1.50.

of thought in science and in religion. The effect is curious. Unlike the Gentile, his astutely critical mind refuses to reconcile the old with the new by ingenious and plausible explanations. Neither has he the Occidental courage to choose deliberately between materialism and the ancient, ever refreshing hope of immortality. And the book closes with him halting vaguely between these issues, an agnostical attitude that is characteristic of the modern Jew. But the story is told in an admirable literary style and with dramatic fervor, rather than power.

It is possible for a novel to be a work of literary art, and yet fall far short of the author's record as a writer of fiction, a distinction suggested by Mrs. Dudeney's new book, *The Story of Susan.** She has made out of the characters and of the situation all that can be made; the trouble is that neither is sufficiently significant to call forth her best efforts. Many will recall that wonderful woman in "Spindle and Plough." The year she appeared in her old English garden there was scarcely another heroine in current fiction to be compared with her, she was so large, capable and tender. She passed from one ordeal to another easily, as one nobly able to bear great burdens and to endure great sorrows. Now with the genius to create a character of this kind, it is a matter for regret that Mrs. Dudeney should waste her gifts in the portrayal of this pretty lady's maid, "Susan," in the midst of a religious situation, where she is as much out of place as a canary bird would be in the choir of heaven. Not that such do not exist as she represents, but they should be left for so many other writers who can do nothing else but interpret the morbid and unnatural.

Among the clever novels of American life just out, one of the best is *An Evans of Suffolk.*† The scenes are laid in Boston; the author has discovered with exquisite humor the remote historical angle from which a conservative family there view the passing of the vulgar trend of events in the world about them. Few writers would have undertaken the sacrilege of interpreting old-fashioned Boston society, and few have been more successful in the literary result. Naturally an interesting story could not be written with only thoroughbred Mayflower aristocrats, sobered still by Puritan consciences, for the *dramatis personæ,* so the author has valiantly introduced two sensational characters. "An Evans of Suffolk" is a very dissipated, inconvenient black sheep English gentleman, who finally shoots himself in the most vulgar manner on the family doorstep, and the hero marries a beautiful but mysterious young woman. Whenever the lady shows off by letting down her long hair in the presence of the hero, it is a bad sign; and it is the worst possible sign in a tightly crimped place like Boston. Thus, the reader is led to suspect the ancestral authenticity of this pretty woman because she goes through this Circe performance the first chance she gets; how much more, then, would a blue-strained Boston household suspect her? It is fortunate indeed that she is not burned for a witch. The explanation is that she is a figment of the author's own imagination, and really impossible to the sacred centers of Boston domesticity.

It is always an occasion for anxiety to a young author's friends when he begins to flood the market with his literary wares. A stagnation of the imagination generally follows such a freshet of ideas. But the fact that Mr. Frank Spearman has published three novels within little more than a year's time looks very much as if he is determined to deliver himself once for all and have done with it. We sincerely hope he will quit when he has finished! So far there is no appreciable loss in the quality and power of his work, altho *The Close of the Day,** his latest story, is not so interesting as "The Daughter of a Magnate," and the situation will prove less popular. But it is one of the few novels of the day in which the life of the stage is treated courteously and with artistic appreciation. The heroine is an actress and the hero is a man of the world, but there is no immorality cunningly devised behind the scenes to teach the young

* THE STORY OF SUSAN. *By Mrs. Henry Dudeney.* New York: Dodd, Mead & Co. $1.50.

† AN EVANS OF SUFFOLK. *By Grace Farquhar.* Boston: L. C. Page & Co. $1.50.

* THE CLOSE OF THE DAY. *By Frank H. Spearman.* New York: D. Appleton & Co. $1.25.

reader the dangers of the profession. This is a salacious insincerity of which the author is apparently incapable.

Evidently there is a lack of literary intelligence in the South. The average author from that section does not lack for sense or wit, but his artistic perspective is primitive, and there is no hope for him so long as he keeps his grandfather's tombstone in the front yard of his imagination, from which to take his sight upon every situation. And he is the only artist known to the literary world who persistently sets his own family homestead in the midst of every landscape. Indeed, that is generally the purpose for which he writes the book. An illustration of this is seen in *The White Castle of Louisiana.** The book is an interesting and instructive hodge podge of Southern customs and traditions, dressed up in characters black, white and yellow. But it is apparent that the author never wrote a book before, and that she should never have written this one. A part of its incoherence is due to the fact that she begun it "long ago, simply and for pastime, etc." It is a curious density on the part of such writers that they should imagine this exposition of their literary shortcoming is also a justification. The point is, if the thing was written for personal pastime, why inflict it upon a long suffering public?

We should have a statute of literary limitations in this country by which an author might be forcibly retired when he reached the stage of romantic garrulity. In that case, Mr. Cyrus Townsend Brady would be among the first to be relieved of his ink-pot. He has a fatal facility for writing sentimental foolishness about the South. His last novel † is a sort of doll-baby drama, with the scenes laid in Charleston, during the Civil War, of course. The heroine is a young lady in a pink dress, with a white veil on her hat, who nurses wounded soldiers; trembles in the arms of her lover; gets him locked up in her "strong room" to keep him from going upon a dangerous expedition that has been intrusted to him; confesses to the general when she discovers that her lover is about to be shot, and is at last hastily married to him by order of the military staff to save further trouble! Mr. Brady is the sort of story writer whom very young boarding school girls would call a "dear old thing!"

Along with the Southern novels may be mentioned Josephine Sawyer's book, *All's Fair in Love,** because the artificial style of the historical novelist bears a strong resemblance to that of most Southern writers of fiction. The scenes are laid on the Scottish border in the fifteenth century, during the Regency of the Duke of Albany. As is usually the case in these romances, two hot tempered men are in love with one woman; the historical novelist always begins without enough ladies to go around, and some one is abducted, or nearly killed before the impromptu maiden is found. In this volume, her advent is hailed with relief by the peaceably minded reader. But when all is said, it is really a pretty tale as these tales go, and the illustrations are especially fine.

Elegies; Ancient and Modern. By Mary Lloyd. Vol. I. Trenton: Albert Brandt. 1903. $1.50 net.

The two volumes, of which this is the first, promise to be an acceptable addition to our anthologies. The field of what the compiler calls "memorial" poetry is a wide one and contains some of the masterpieces of ancient and modern literature. The collection will place in the hands of readers specimens with which they might not otherwise become acquainted. The name "elegy," undoubtedly, in modern usage, may be applied to any serious poem which has a note of sadness, whether or not that sadness deepens to poignant grief; and Miss Lloyd's preliminary study of the elegy, in this sense, is a careful, able and instructive critique of the best specimens from the time of the Hebrew King David to modern days. Exception, however, can be taken to the use made of the term "elegiac." In literature the word is not recognized as the adjective corresponding to the noun elegy, but is reserved as

* THE WHITE CASTLE *By M. R. Ailenroc.* Louisville: John P. Marton & Co. $1.25.

† A LITTLE TRAITOR TO THE SOUTH. *By Cyrus Townsend Brady.* New York: The Macmillan Co.

* ALL'S FAIR IN LOVE. *By Josephine Caroline Sawyer.* New York: Dodd, Mead & Co. $1.50.

a technical term for a form of verse. In Greek and Latin poetry this is a distich consisting of a hexameter followed by a pentameter, and the author of the essay recognizes this on page 24. In English poetry elegiac stanzas consist of four iambic pentameters rhyming alternately, as in Gray's "Elegy." To speak of a sonnet, an ode and various modes of lyric as "elegiac" is confusing. The present volume contains an admirable selection, beginning with a beautiful funeral hymn from the Rig Veda and bringing us down to Congreve, who died in 1729. In the case of foreign originals the translator's name is generally appended, bnt there are four sonnets from Petrarch of rare quality from which it is unfortunately omitted.

Windsor Castle. By W. H. Ainsworth
The English Dance of Death. By the author of "Dr. Syntax." Two vols.
The Fables of Æsop and Others.
The Second Tour of Dr. Syntax.
The Tower of London. By W. H. Ainsworth.
The Life of a Sportsman. By Nimrod.
The Analysis of the Hunting Field. New York: D. Appleton & Co., $1.75 a vol.

These volumes are a part of a series of works of the early part of the last century which are famous for the illustrations as well as the text, and in each case both the original text and the illustrations are exactly reprinted, many of them pleasingly in color. Thus the multitude of colored designs in *The Dance of Death* are by Rowlandson; those of *Fables* and *The Second Tour* by Thomas Bewick; those of *The Tower of London,* a hundred of them, by George Cruikshank, and those in *The Life of a Sportsman* and *The Analysis of a Hunting Field* by Henry Alten. The type of these 16mo volumes is clear, the paper good, and the illustrations attractive as specimens of a style in drawing and color which much pleased our grandparents in their youth.

Christopher Columbus. His Life, His Work and His Remains. By John Boyd Thacher. Vol. III. New York: G. P. Putnam's Sons, $9.00.

The present volume completes this sumptuous and richly illustrated work, which we have reviewed at considerable length on the appearance of the previous volumes (see pp. 1460, 3129 of last year). Volume III is devoted to the portraits and handwriting of Columbus, his death, burial and exhumations, and his descendants. It contains an appendix of important documents and an exhaustive index to the whole work.

Pebbles

"POCKS VOBISCUM," said the physician, as he glanced at the face of his patient.—*Columbia Jester.*

....What words may be pronounced quicker and shorter by adding syllables to them?—"Quick and short."—*The Educational Review.*

....Having voted strongly for municipal ownership, Chicago now has only to get the consent of the street railways to realize its hopes.—*The Detroit Tribune.*

....A book publisher declares that no first-class fiction is being produced these days. Let him keep his eye on the resolutions of the political conventions.—*The Kansas City Journal.*

....We regret to announce to the poetical that when the day's work is done, we are too tired to take a child by each hand, and lead them off to the woods to learn the Lesson in the Violet.—*Atchison Globe.*

....A remarkable duck story comes from Nantes, France. Some fishermen were out at sea during a terrific thunderstorm, when suddenly a number of roasted ducks fell into their boat. The lightning had struck a flock and cooked the birds to a turn!—*Argonaut.*

There was a young man of Deraggon
Who had a perpetual sleepy look:
He lay with a straw
Well stuck in his jaw,
And the other end stuck in a flagon.
—*Yale Record.*

...."I've come to tell you, sir, that the photographs you took of us the other day are not at all satisfactory. Why, my husband looks like an ape!" "Well, madam, you should have thought of that before you had him taken."—*The Woman's Journal.*

There was a table in our house,
And he was very wise, sir;
The maid took off his glasses, so
He couldn't use his eyes, sir.

But when he found he couldn't see,
And heard the chairs "haw, haw," sir,
He turned the laugh right back at them,
He took a cup and saucer.
—*Cornell Widow.*

Editorials

The Abuse of Tariff Protection

SENATOR ALDRICH says that the tariff question will be the principal, if not the only, issue of the campaign. It is true that certain other questions which have been prominent, or even paramount, in recent campaigns will not excite the average voter's partisan energy this year. But at the present time there is no evidence that a tariff contest on old and familiar lines is to overshadow all other controversies in the approaching struggle for control of the executive and legislative branches of the Government. There is no sign that we are to have a tariff battle in which protection will be required to defend itself against free trade, free raw materials, or duties for revenue only. If the tariff shall be a leading issue, it will take that place by reason of association with the question of the Trusts, and on account of the relation existing between some of the tariff duties and certain industrial combinations.

Many years ago it was the custom to defend protective duties by the argument that competition in the industries established under the shelter of them would speedily reduce the price of the protected products. Modern conditions and tendencies have shelved that argument. It is true that competition prevails in some of our protected industries, where prices are determined by it, and where the margin of profit continues to be narrow; but the general tendency is to suppress competition by combination, in order that higher prices and much larger profits may be obtained. Economy in production is not wholly ignored, but we see no evidence that the chief aim of those who combine is to secure it.

When competition from abroad has been shut out by a high tariff, the making of combinations in the protected market is suggested and invited because the profits to be obtained are so large—much larger than can be acquired by the suppression of local competition where there are no protective duties. A comprehensive combination in our protected market may be able for a time to exact prices higher by 50 per cent. than those that would be the result of competition. The combination does not fear an invasion of competition from abroad, for such competition is excluded by the tariff wall. The abnormal profits thus obtained suggest stock-watering, overcapitalization and other evils noted in the growth of our Trusts. It is in this way that a high protective tariff, while not in a strict sense the "mother" or creator of combinations, invites the making of them and enriches those who are able thus to take advantage of the high duties. Obviously, these beneficiaries of combinations sheltered by the tariff oppose any reduction of the duties and even seek to have them increased. Their influence, commonly being that of great wealth, has much weight.

Some of these protected combinations sell their products abroad at prices very much lower than those which they exact from their own fellow-citizens who voted to give them the protection which they abuse. Mr. Littlefield, a loyal Republican, said in the House two weeks ago that it was the policy of the Republican party that duties so abused should be cut down. He knew of no Republican, he added, who did not hold this opinion. No one on his side of the House interrupted him with a disclaimer. But such an abuse of the high duties has been notorious for years. Has the Republican party in Congress proposed to reduce any of these rates? Has not any Republican who suggested a revision of the protection so abused been regarded as a heretic and a disturber of the peace?

The steel rail trade furnishes a plain example of this discrimination in favor of foreigners. Here is an industry in which the combination has for a long time been substantially complete. All the manufacturers have been in the Association, which is controlled by the great Steel Corporation, to which more than half of the rail output is allotted. At the combination price, last year's entire output had a value of more than $78,-

000,000. For several years the combination's unvarying price to buyers in the United States has been $28 per ton at the mills. But members are permitted to sell abroad at much lower figures. To the Canadian Pacific road, just across the boundary, they recently sold 30,000 tons, delivered at Montreal, for $21¼, which was less than $20 at the mill.

The president of a railroad in Georgia says that he paid $28 for rails to be laid on that road, and that rails were at the same time offered to him at $20 for a road in Honduras in which he was interested. The officers of a road that lies partly in Texas and partly in Mexico have paid $28 at the mill for rails to be laid in Texas, and only $24 for rails delivered at Tampico for the Mexican part of their property. Members of the Association have sometimes said that these sales were made in order that the mills might be kept running. Such an excuse is an insult to the intelligence of the American people. Could not the mills be kept at work as easily by selling these rails to Americans? Has there been a time in the last four years when the demand could not be greatly increased by reducing the ring price of $28? In the end, of course, it is the American people, the American consumers, that pay for the rails.

In other branches of the iron industry, and in other industries, similar discrimination is practiced. It has been said that the steel industry is not controlled by combinations, because the Steel Corporation makes only 65 per cent. of the output. But, as in the case of rails, so in the production of billets, sheet bars, structural steel, plates, and other forms, output and prices for the entire industry are controlled by Associations or Pools, in each of which the Steel Corporation is the dominant member. There is a price for the Americans who gave the industry protection, and a much lower one for the foreigner who buys American nails, billets, bars, etc., of which more than 45,000 tons were shipped from Eastern ports in March. The difference in the two prices of nails was at one time so great that a trader bought a cargo for export, took it across the Atlantic, brought it back, paid the duties, and even then sold it here profitably at a price lower than that which the combination exacted from buyers in the home market.

If the tariff becomes a leading or the chief issue, attack will be made upon such abuses of protection rather than upon the principle of protection and a fair application of it, against which a majority cannot be brought to the polls. We believe, however, that upon the question of reducing duties profitably used by monopolistic combinations or rings that discriminate in prices against the people of their own land, if it could be submitted to the country by itself, nine-tenths of the voters, Republicans as well as Democrats, would demand reduction. A Republican promise to revise and reduce these duties in 1905 will not be a sufficient answer to the question, "Why did you not cut them down in the Fifty-seventh and Fifty-eighth Congresses?" It would be unwise for the party to attempt a defense of them and to say that they ought not to be touched.

On the other hand, if the Opposition seeks to make such tariff revision a leading issue, it should not forget that a part of the profits which combinations have gained by monopolistic prices exacted under the shelter of high duties has been yielded up to labor, not willingly, as a rule, but in response to pressure from the unions. This part, so far as it may still be seen in their wages, the workmen will not be inclined to surrender.

Defenders of the Bible

THE American Bible League, which held a convention in this city last week, has for its avowed purpose the defense of the Bible. The form of application for membership thus defines the conclusion which must be reached by the studies of its members:

> "Believing in the divine origin, inspiration, integrity and supreme authority of the Scriptures of the Old and New Testament, I desire to become a member of the American Bible League."

Memberships are of four kinds, involving a payment of $1, $10, $100 and $500. The sessions of the convention lasted three days, and the addresses were devoted to the "defense of the Bible" under such heads as "The Present Assault on the Bible," "Practical Consequences of the Attack on the Bible," "Ground-

lessness of Rationalistic Claims," "The Evolutionary Fad." The speakers included several men of scholarly distinction: President Patton and Professor Wilson, of Princeton; Professor Osgood, of Rochester; Professor Wolf, of Gettysburg, and Professor Wright, of Oberlin, and a number of clergymen noted for their strict conservatism, such as Dr. Plumb, Dr. Booth and Dr. Burrill. The teachers of Old and New Testament in our theological seminaries were represented by Professors Osgood and Wilson, but the chief task of defense was put upon others, as the biblical experts were few.

The Bible League does not represent a healthy or courageous attitude toward the Bible. The Bible needs study, not defense. Students of the Bible are not its enemies, but its friends. The proper sentiment toward any investigation of the Bible is not that of hostility, but of cooperation and friendship. To attack the higher critics or the believers in evolution as enemies of the Bible is a suicidal kind of war. It is the most effective way of discrediting the Bible.

And yet this is the method chosen by the organizers of this League. They publish a monthly magazine called *The Bible Student and Teacher,* of which four numbers have appeared. It is devoted to attacks on higher criticism and modern science, the conclusions of which it declares to be as vicious and dangerous as the teachings of Thomas Paine.

Why should any lover of truth be afraid of investigation, no matter how radical? Whoever knew truth worsted in a fair encounter? If these men do not think the conclusions reached by nine-tenths of our biblical scholars and ninety-nine hundredths of our scientific men are true, let them meet the enemy in the fair field of discussion; one David, even a Burrill, could overthrow the whole army if armed with the sling of good argument and genuine scholarship. That is better and braver far than to stand off and make faces at the Philistines.

We do not like to say it, but there is the look of a big publishing and financial scheme behind this League. In these days of rival publishing establishments behind Bible Lessons, Young People's Societies, etc., it is not too invidious to suggest this. We have mentioned the appeal for membership of the League at assorted rates. At the last session of the Conference the General Secretary opened the purpose in view. It involves the establishment of branches for Bible defense in every State, city and village in the country. These are to be connected with Sunday schools, and the million and a half teachers are to be supplied with a series of Bible Primers, as a first installment, of which one has been isued, also Bible tracts—one or two now for sale—and these to be followed by larger works, up to an extensive Bible dictionary, which shall rival in size and completeness the Hastings "Bible Dictionary" and the "Encyclopedia Biblica." This is a large financial scheme and will provide employment and profit for the successful managers. It will appeal to a great many who really fear that the Bible is in danger.

These men are going at it in the right way for profit for the managers, but not in the right way for the search after truth. They confessedly take the position not of investigators, but of advocaters. They first reach their conclusion and then defend it in every way. It is, for all they say, safe to make and to welcome the most searching investigation of old beliefs, whether in science or history or philosophy or theology. Many old beliefs may be given up, but the sure conclusion is truer beliefs, and truer beliefs are always safer. So let the critics argue at their own sweet will on two sides or many sides. If certain venerable beliefs get argued out of court, let them; it will be "dangerous" then to cling to them. And let this be always remembered, that high ethics and genuine religion are safest with the newest discoverable truth; and that, above all other liberty, must we value the fearless, untrammeled search for truth which has no fear of the consequences.

The Monroe Doctrine Not Obsolete

Professor Münsterberg, of Harvard, tells us, and tells the Germans, that the Monroe Doctrine is obsolete, or soon will be, because the reasons for it have passed. There is no longer, he says, any danger of tyranny trying to suppress liberty, for the nations of Europe, Rus-

sia excepted, have the same liberty, under somewhat different forms, that we have. And no longer, he tells us, would colonization of South America by European nations be any peril to the safety of our Republic. Accordingly, the reason being passed, the rule should pass, and we ought not to cling to the anachronism which forbids European territorial aggression on this Western Continent.

The argument has a little plausibility, but it overlooks an important consideration; and that is, that from the beginning the Monroe Doctrine had in view the protection of other American nations which had followed our example in asserting their independence as well as our own safety and welfare. That is, from the beginning it was not wholly selfish.

In 1826, when John Quincy Adams, the real author of the Monroe Doctrine, was President, and Henry Clay Secretary of State, and Calhoun, Webster, Van Buren, Polk, Benton, Buchanan, Hayne, Randolph and Dickerson were in Congress, after months of animated debates over the question whether the United States should join other American nations in an armed league against possible European attack, the House of Representatives passed a resolution declining to join such as league, and added these words:

"The people of the United States should be left free to act, in any crisis, in such manner as their feelings of friendship toward those republics, or as their honor and policy, may at the time dictate."

This was a distinct statement that two purposes were held in view from the beginning as to the Monroe Doctrine. One purpose, the first here mentioned, was "friendship toward those republics," purely unselfish; the other was our "honor and policy," which concerns our own interests. This is entirely overlooked by Professor Münsterberg in his conclusion and prophecy. Because he thinks our selfish interests are no longer endangered, he also thinks we have no further reason to insist on the Doctrine. We can, he judges, let Germany seize the half of Brazil, as if we had no "feelings of friendship" for that country, which would be outraged if its autonomy were attacked.

Some people seem to have a constitutional difficulty in conceiving how a wave of generous sentiment can sweep over a country and control or reverse the influence of other selfish considerations. They will not see that anything but self-interest led us into the war with Spain. To them President Cleveland's defense of Venezuela was profitless buncombe. They can see but one side of the Monroe Doctrine. But times change, and the reason for it which concerned our own protection became weaker, until it was almost evanescent, while the reason of friendship has grown more controlling. We are not afraid for ourselves, but for Brazil in any such proposed seizing of her territory as the Powers of Europe have been guilty of in Africa and China.

The principal countries of our continent, Mexico, Brazil, Chile and Argentina, are now fairly well governed under constitutions that work well. We imagine that their citizens of foreign birth would not exchange the governments under which they live and the liberty they enjoy for the taxes and restraints of Italy and Germany. Under the guarantee of the Monroe Doctrine these nations have grown strong and their institutions firm. The Doctrine has borne good fruit. We cannot say as much yet for Venezuela or Colombia or Uruguay or Peru or Santo Domingo. But they should be left to work out their own salvation. They will do it in another fifty years if they are let alone; and that we propose shall be their privilege.

Typhoid Inspection of Oysters

A CONSTANT source of solicitude for the Department of Health of New York City is the series of typhoid fever cases that keep on occurring. They are not frequent enough to deserve the name of an epidemic. They do not occur in any special quarter of the city except under certain circumstances, and they are so scattered and, compared to the whole number of the population, so infrequent that it is very evident that they are not due to the water supply, which is the usual source of the disease. A certain number of cases of typhoid fever every year are traced to the milk supply. The milk from farms on which cases of typhoid fever have occurred, or from dairies situated along streams into which

the excreta of typhoid fever patients find their way, may and does actually prove a source of typhoid contagion. For the remaining cases two causes are usually appealed to. One is raw oysters and the other is raw vegetables of various kinds which by some chance have become infected.

Of late years the suspicion with regard to oysters in this matter has been gaining in strength. In a certain number of carefully studied cases in England, and later in this country, oysters were absolutely demonstrated to be the actual factors in the transmission of the disease. In one American university town the cases of typhoid fever that occurred were all traced to the oysters eaten at a fraternity dinner, and, taking a hint from this, the oysters furnished by the dealer who catered were found actually to contain typhoid bacilli. This was not because the oysters had been infected in their beds before being dredged up for market, but because while kept in crates in a flowing stream of fresh water in which sewage material was present the oysters became a culture medium for typhoid bacilli.

In order to explain the continuance of typhoid in New York City, then, in spite of the enforcement of sanitary regulations and the notable improvement in the milk supply in recent years, the Department of Health has lately inspected the sources of most of the oyster supply of New York City. The details of the report are enough to convert any lover of the oyster into a determined devotee of sanitary inspection.

Most of the oysters that are sent to New York in the regular course of trade are provided with many opportunities of becoming infected with sewage material of varying degrees of virulence. Along the Sound shore of Long Island, or of Connecticut, or in Staten Island, or in New Jersey, oysters after gathering are exposed for some time to contamination by being placed in the waters of little streams that run out into the salt water and carry down with them the sewage and drainage of neighboring villages and of various factories and farms along the banks. This subject has not been investigated merely by casual inspection, but definite incontrovertible records of what inspectors observed have been preserved by means of photographs.

At the last meeting of the Medical Society of the County of New York, held April 25th, 1904, these photographs were exhibited as stereoscopic slides with proper explanation of their significance by Dr. Walter Bensel, the acting Sanitary Superintendent of the Department of Health of New York City. The oysters are stored before shipment for several days, as a rule, in oyster houses, the lower floor of which is below the level of the water, or in oyster-floats, through which the water is allowed to find its way. These houses and floats are usually placed some distance up various little streams. It has been found that if the water which flows over the oysters is not entirely salt, the shellfish become plump and are somewhat bleached, thus looking more inviting to the untrained in oyster lore. This process is known as "fattening." Fattened oysters are not to the taste of the real oyster epicure, however, who prefers to eat the fish undiluted with the amount of water which, owing to the unusual medium in which it is placed, the oyster absorbs, because of disturbance of its regular metabolism during the so-called fattening process.

Many of the photographs exhibited show the existence of privies and other sources of the worst forms of sewage, such as barn yards, poultry yards and various unclean factories, situated either on the banks of the streams or not far away from them. In some cases old privies are to be found within a few yards of oyster houses and the water soaked soil between surely does not prevent the infiltration of sewage material. In one picture oyster-floats are seen situated not far from a railroad bridge, over which there is considerable traffic. It is easy to realize that the water underneath this bridge is not likely to be in such a state of even apparent purity that most people would care to take oysters directly from it to place them on their table. In most of these streams the ebb and flow of the tide prevent even that carrying away of floating material common in ordinary country streams. The material becomes diffused through the sluggish water and there is probably even

an opportunity for the increase of whatever bacteria are present, and this adds to the danger of infection by the oysters.

These observations come at the end of the oyster season, when they are not likely to produce any great sensation, but just when they should bring about under the most favorable circumstances such changes in the conditions of harvesting oysters as will remove the present dangers. It seems perfectly clear that oysters should, while being made ready for the market, be allowed to come in contact only with water that is known to be wholesome drinking water, and should be kept entirely away from any possibility of sewage contamination. There are some places now where the regular water supply of the town is used for covering oysters that are stored. If necessary for preservative purposes salt might be added to it. Certainly under the present condition of affairs any one who eats raw oysters without knowing just where they have come from is running as serious a risk of contracting typhoid fever as if he were to drink unboiled water in Philadelphia or in Cleveland. Unless he can be assured in some way of the careful protection of oysters from the possibility of infection the only alternative is always to take them cooked, as it is necessary now for the people of many towns in this country always to boil their water before using it, or else to purchase some brand of bottled water in which they can have confidence. The present announcements are not sensational. The precautions suggested are a simple matter of common sense. As population grows denser such precautions with regard to food and drink always have to be taken, or else money must be spent in securing articles that are surely without contamination.

Revolution by Alfalfa

THE introduction of a single plant has wrought a revolution in the social and the economical affairs of the whole world. The potato changed affairs in Europe as much as, or more than, did Napoleon. One of our ablest physicists says: "Give us a wheat that will yield an average of sixty bushels per acre and the world will be absolutely made anew."

Probably the greatest agricultural revolution of the present generation is being wrought by the quiet introduction of the new forage plant alfalfa. This plant came into the United States at least half a century ago, but it was confined in its culture mainly to California. It has recently been found to thrive equally well from Maine to Oregon, and through the whole mid-continent. There is not a State where it has proved to be a failure. It is far and away the best soiling crop and the best hay crop ever introduced into the United States. In the short space of about ten years it has come to the front, leaving even the red clover and timothy a good way behind in the race.

Alfalfa, or lucern, seems to have had its origin in the central districts of Asia, but was known in Greece and the Roman states at least two thousand years ago. The Romans cultivated it as a forage, to be carried on their forays against the Germans and into Africa. We hear of it during the first and second centuries. It was taken into Mexico by the Spaniards, and when first brought into special notice and investigated at our Agricultural Stations it was supposed to be a South American plant.

The peculiar qualities of this new plant are first of all that it is a drought-resister. It feeds so deeply that only the most protracted dry weather can possibly have any effect upon it. It feeds from ten to fifteen feet down into the most compact soils, and is said to have a capacity of going even fifty feet into loose soils. The young plant consists of a number of low branches, springing from a simple stalk at the crown of the roots. On the old plant the robust stems will grow underground and become new plants. That is, the plant has a power to multiply itself by side growth. It will grow in any soil, from the sea level to seven thousand feet elevation. In the foothills of California and Colorado it has reached this hight and thrived. It adapts itself to limestone, but grows best in a light and sandy loam with a loose subsoil. It makes but one demand upon us, and that is for good drainage. Water must not be allowed to stand on a field of alfalfa for more

than forty-eight hours, for, if the ground becomes saturated and remains so for any length of time, the roots will decay. With a good soil, rich in lime, potash and phosphoric acid, and a subsoil thoroughly drained, the plant is permanent. It will resist a drought of the severest character and give its three crops a year without failure. The Turkestan varieties have a better power for resisting drought than those formerly introduced.

The Western States report that the value of alfalfa is becoming more and more understood, and the area grown is steadily widening. This is specially true of all the stock producing States west of the Mississippi. In the Eastern States the new plant has been tested with a good deal of caution and conservative doubt. The United States Department of Agriculture reports that every State in the Union is now experimenting with alfalfa, and it is considered to be one of the most important movements that ever occurred in connection with American agriculture. In the Southern States the best results are secured from autumn sowing, but in the Middle North and North alfalfa should be drilled in the spring, when danger of hard frost is past. It grows taller in the Western States than in the Eastern, and is said to be even more drought-resisting.

Like clover alfalfa is a nitrogen collector. It belongs with those plants which can collect from the atmosphere its food by means of minute organisms on the roots. If examined the roots will be found to be covered with small tubercles, and these, when examined under a microscope, will be found to contain great numbers of bacteria. Alfalfa holds this power in connection with the legumes in general, including beans, peas and clover. By growing it the farmer not only secures a large quantity of excellent hay or fodder, but he enriches his fields, instead of exhausting them. If the crop is plowed under it supplies a vast amount of nitrogen to the soil.

The amount of hay that can be cut per acre from alfalfa is from four to six tons —from three successive cuttings. This alone would class the plant as revolutionary. It considerably more than doubles the average hay crop. Our Eastern farmers have not yet acquired the requisite skill in always securing the best alfalfa hay, but they are making gains from year to year. The value of the hay will depend upon thorough curing before the leaves have dropped off. The number of cuttings vary from three in New York State to seven in Pennsylvania and the Southern States. There is a field reported from the State of Sonora, in Mexico, which is known to have been kept in alfalfa continuously for over sixty years and is said to be in as good condition today as it ever was. Well cured alfalfa hay is worth as much, weight for weight, as any other hay, and it is suitable for all farm animals. An alfalfa field, however, does not always make safe pasturage. The hay and the fodder are profitable when fed as rations for all sorts of farm stock, especially for sheep and young, growing cattle and horses. It is an almost perfect soiling crop. Teamsters find that their horses are kept in perfect condition for work by being fed on fresh cut alfalfa from small fields. In other words, it serves admirably for those who have only an acre or two of soil and heretofore have had to buy grain. The Department of Agriculture reports that a single acre of alfalfa will furnish forage for twenty hogs through the season.

The story is quite too long to be told editorially, and we leave the fuller discussion to the agricultural publications. But this much we already see, that we have in alfalfa a plant that promises to work an amazing change with stock-growing, hay-producing and honey-producing, especially during years troubled with drought. The product is more than double that of any forage or hay crop heretofore in cultivation, if we except the cow-peas, which, of course, cannot compete in our Northern States. Agriculture bids fair to be developed in more ways than one. The enormous expansion of our markets requires that we shall be vigilant to put ourselves in position to meet the increasing demand for our products. With the old forage plants our meat supply will soon be behind the demand, and the same may be said of our supply of horses. It is equally important that we shall be able to create a flank movement in these days, when droughts are destroying sometimes one-fifth of our products.

The Labor Treaty Between France and Italy

A NEW step in the development of closer international relations is marked by the labor treaty between France and Italy which was signed on April 15th, and which President Loubet, in his speech at the banquet given in his honor at the Quirinal last week, alluded to as of equal if not greater importance than the arbitration treaty recently concluded between the same Powers. This is the first time two nations have engaged themselves to work in harmony for the benefit of the laboring classes. Treaties have in the past been chiefly for the purpose of putting a stop to warfare, military or commercial. They have been the settlement of quarrels, but this new form of treaty, unforced by the pressure of circumstances, is for mutual help in the development of better industrial conditions in the future.

The two objects of the treaty are, first, to secure equal rights to workingmen residing in another country; second, to insure concurrence between the two countries in raising the standard of life. Both the French and Italian Governments are now under the influence of socialists, who are pledged to similar programs for the benefit of labor by factory laws, old age pensions, etc.; but it is impossible for one nation to advance much beyond its neighbors in such legislation because it would be underbid in the markets of the world by the cheaper labor of other countries. One method of preventing this is the high tariff system adopted with considerable success by the United States. The new method is that of international concomitance of labor legislation. In short, France and Italy have formed a sort of labor union and agree not to "scab" on each other.

Since in Italy the conditions of labor are worse than in France, the former country has first to level up. The immediate result is the establishment in Italy of a system of factory inspection, which will secure the enforcement of the law of June 19th, 1902, by which the employment of women and children at night is forbidden, and eleven hours is made the maximum for their day's work.

In securing equal rights for foreign as for native workingmen Italy gets the greater benefit, since there are 200,000 Italian laborers in France and only 10,000 French in Italy. According to the new treaty the National Savings Bank of France and the Postal Savings Bank of Italy will each honor the deposit books of the other; so the workingman in a foreign country can continue to deposit his savings, or withdraw them, without expense or delay, wherever he may be. Any accident indemnities or pensions which may become due to an Italian laborer while in France will be paid to him just the same when he returns to his native land, or, in the case of death by accident, to his heirs in Italy. Italy, of course, assumes the same obligations in regard to French workingmen resident within her borders.

The treaty assumes that it is the duty of government to supplement the savings of a workingman so that at the time of his disability through accident or old age he may have sufficient means to enjoy life after his retirement from active labor. It is mutually agreed between the contracting Powers that this right to support shall not be forfeited by a workingman who spends part of his life in a foreign land.

In this international agreement France and Italy have set a good example to our own States, which, tho they belong to the same nation, have made no official efforts to secure uniformity of legislation, altho many reforms, generally admitted to be desirable, are practically impossible without it. Whenever one State has endeavored by restrictive legislation to raise the standard of living, the other States, instead of seconding the movement, have even tried to take advantage of it to secure the industries it was attempted to control, by offering unlimited liberty if they would move. The present irresistible and in some respects dangerous movement to enlarge the scope of national control is caused mainly by the lack of uniformity of legislation of the several States. It is not an edifying spectacle to see States competing with each other by means of lax legislation in the attempt to secure the greatest number of divorce colonies, sweat shops, child labor factories, bogus insurance and fake corporations.

How to Stop Hazing

At last the right way has been taken to break up hazing at one of our colleges, and to teach young men that the laws of decency and the country are not invalid on the campus. A number of students at the St. Stephen's Episcopal College at Annandale, N. Y., an institution favored by students expecting to become clergymen, brutally hazed a freshman. The boy's father demanded an apology from the offenders before the faculty. This the faculty and trustees did not require, whereupon the father brings a suit for damages against the college, and has warrants issued for the arrest of the hazers, who, we hope, will suffer the penalty of the law. A part of the father's letter to the Secretary of the Board of Trustees is good healthy reading:

"Our anxiety is not so much for my son's college career as for the effect that the outcome of this will have upon his character. He has always been brought up to honor the Church and to respect the clergy. How can he do so when he sees candidates for the ministry boasting of becoming intoxicated, openly breaking a pledge which they signed without reserve [not to be guilty of hazing], to hold good as long as they remained at St. Stephen's; committing a criminal offense, from the punishment of which they seem to think they are shielded because it was committed within the college limit, and all this without one word of rebuke from the college authorities? A Church college ought to take a very high stand upon these matters."

So it ought, and so ought any college.

The Future of Russia

The amazing succession of Russian disasters since the beginning of the war makes one pity the poor Czar, who wanted no war and who was told that the Japanese would not dare to fight the great Russian Empire. It must be that the Russians were in a woful state of unpreparedness for the conflict they so jauntily challenged, and that their methods were faulty and obsolete, while the Japanese had bettered all the lessons they had learned from their Western teachers, and had made the most thorough preparations. We already begin to anticipate what must be the result of the depression of Russian feeling, and of their indignation at the folly of those statesmen who had deceived them. An unsuccessful war may be the greatest blessing to Russia, if it teaches Czar and people to distrust their tyrannous Plehves, and to assimilate their institutions to those of other European nations, which recognize that the people have rights in government. The Russians are a people that put much confidence in icons and omens. When the Crimean War ended Russian expansion in the West, one solitary success in the Far East, the repulse of an Anglo-French landing party at the little port of Petropavlovsk, in far-off Kamschatka, was taken as a most happy omen that Russia must seek her expansion in Asia, and that has been her policy since. But now that name *Petropavlovsk* is coupled with disaster in the sudden sinking of the finest of the Russian battle ships, with seven hundred men, where shall Russian hope now turn, but to that internal improvement which is so much needed?

Mormon Control

We have further installments of the investigation by the Senate of the influence of Mormonism in Utah and Idaho. Little new can be told on that subject, for it has always been recognized. It is a bad or good thing, according to the view we take, if a Church meddles with politics, but that it has a right to meddle there can be no question, at least from the political side. The Methodist Church, or the Mormon Church, or the Catholic Church has the same political right to take sides in any political issue that any other club of men has. It may be very un-Methodistic, or unchurchly, to do so, but politics can make no complaint. Indeed, various States of the Union for years after the Constitution was adopted united Church and State; they supported denominational Churches, and raised the ministers' salaries by public tax, and they can do it again. If Utah should pass a law supporting the Mormon Temple at Salt Lake City out of the public revenues it would be just as constitutional as a New York law which makes appropriations for a Catholic or Jewish Protectory. Accordingly it seems to us that all the evidence brought forward to prove the control exercised by the Mormon Church is very enlightening but has no bearing on the

right of Reed Smoot to a seat in the Senate. If the Mormon hierarchy passes on the candidacy of its members, and instructs them to stand or to withdraw, that is very bad churchmanship, but it is quite legitimate from the view of the State, which is willing that every man and every combination of men shall exert all the influence they can. But one most agreeable point has been brought out in the testimony and that is that the younger Mormons will have no polygamy; so that the old Apostles could not restore it by revelation if they were to try.

The Abbé Loisy

We have not yet heard that Abbé Loisy has dutifully repudiated his writings condemned by the Index; but we do learn that he has yielded on another point. For four years Loisy has been conducting a course of lectures on Church History and biblical criticism in the School of High Studies, believing that as a Catholic he has the right to give freely the results of his studies in a Government institution. But the theologians did not like his teachings. He did not find the hierarchical system in the earliest period of the Church, but believed it was normally developed from its germs. His lectures drew a multitude of hearers, but the Cardinal Archbishop of Paris was afraid of them, and forbade students under his control to attend them. Then, as all know, he appealed to Rome, with the result that Loisy's writings were condemned. It is understood that the Archbishop had prepared a decree of excommunication, but hesitated to issue it while the law against the congregations was under discussion, for fear it would inflame still more the anticlerical forces. In view of the danger of excommunication from the Church to which he is deeply attached, the Abbé Loisy has now resigned his position as lecturer in the School of High Studies, and for the present he will publish no more. It remains to be seen whether his withdrawal from public service will save him from a worse condemnation than that which fell on his book. The reasons he gives for his resignation are that he desires to assure himself a quiet life, and to contribute, as far as he may, to the pacification of spirits in the Catholic Church. He declares, however: "A Catholic I was, and a Catholic I shall remain; a critic I was, and a critic I shall remain."

At a dinner the other day in honor of a German officer in our Civil War several German speakers told of the prejudice against Germans in their young days. One told how, when he was a boy drilling in Missouri, a "lady" spat in his face, saying: "You are a Dutchman and cannot vote anyhow." Native-born Americans in General Butler's army had that experience in Louisiana. Another German said:

> "The young negro, the young Chinaman, receives to-day more consideration than I did when a boy in the '40s. But thanks to these Generals, and those that came here after the year '48, the 'miserable Dutchy' has evolved into a respectable, respected German lad."

This is a strange picture, and one can hardly believe that the tale is quite a true one.

Recent papers from Athens describe the "Ajax" of Sophocles as presented for the first time in two thousand years in that fair city by the Ancient Classics Association. By an interesting coincidence the tragedy was acted in Athens and in New York on the same day, the 26th of March. There, as here, the parts were taken by men and women. The *Chronos* gives special praise to the part of Tecmessa, which was acted by Miss Zara, a beautiful young Greek woman belonging to one of the best families of Athens. It refers to her melodious voice, her grace and the sincerity with which she played the part, and predicts a brilliant future for her. She seems to have overshadowed the other actors, though the tragedy as a whole was well received.

We have quoted Professor Armstrong, of the Mosely Commission, on the feminization of the American woman-taught schoolboy, who fails to punch enough and be punched. Professor Armstrong, who is a breezy man, makes another round statement

that will startle teachers on both sides of the Atlantic:

"The entire system of education, both here and in America, seems to require reconstruction from bottom to top; it would be well, if I may say so, if we could scrap the whole wretched academic show, and start afresh, in order that it may be greatly improved in quality and shortened in duration."

If he will show the world how to do this it will be a great favor to scholars and teachers.

The protest of the Pope against the discourtesy of President Loubet's visit to Rome is valid solely from the conventional and stale claim that the Italian King has no right in Rome, which belongs to the Pope only. But how long must the occupation of the Quirinal last before it is validated? Must rulers of Catholic nations be forbidden indefinitely to visit the King of Italy, while Protestant rulers are free to do so? Or if the complaint is that no visit was paid to the Pope by the French President, the reason is clear that it had been made plain that if he had offered to call he would have been snubbed.

Who will smile any more at the old story of the chasm that appeared in the Roman Forum, which would not close except at the cost of the most valuable possession in the Roman State, whereupon Mettus Curtius leapt in on horseback, and the chasm closed? The place has been found in the late excavations, all designated with inscriptions. The evidence is as irrefutable as for Hood's story of the blazing forge into which the goblins threw the murderous firemen; and if you don't believe it, there in the Hartz is "the eisenhutte still."

Not by the late Congress was any bill enacted retiring department clerks at the age of seventy; and such a bill should not become law without a civil service pension act. It appears to us only proper that clerks who have served the country for thirty or forty years, at a moderate salary, which allows no competence for old age, should be pensioned when past service. It is no more than other governments do; but this is one of the things which "they do better in France," as says Laurence Sterne.

It is of no use to beat about the bush and put the responsibility on the police; for the Western Union Telegraph Company, with a directorate of intelligent men, must know that it is serving illegal pool rooms with news of the races, and making it possible for them to continue in operation. There can be no law, as its counsel claims, requiring it to be a partner and the operating partner in unlawful gambling resorts. The only motive is the large profit. Thus a company of respectable men will do what no one of them alone would do.

President J. J. Hill, of the Great Northern Railroad, is a mine of wealth to the Catholic Church in the Northwest. He is himself of Scotch-Irish descent, and a Catholic, we believe, only in his wife's name. Some years ago he gave half a million dollars to a Roman Catholic seminary in St. Paul, and now he offers a million dollars for a three-million dollar cathedral in the same city, which will be the finest building in all the West, and a great honor to Archbishop Ireland's diocese.

The London *Athenæum* is guilty of an impertinent criticism when in its review of a scientific book published in Chicago it says:

"Whatever may be thought of international liberty of spelling, formations like 'fiber' and 'center' are not suitable for scientific writing, where assimilation to convention is important."

But the spellings criticised are assimilated to the widest and best convention while England lags behind.

Let it be observed that the Democratic convention meeting in Manila, which elected six delegates to the Democratic convention in St. Louis, asked for the Philippines only territorial government with the largest measure of home rule, but not independence. That is very much like what we have given the people there, so that opponents of the Republican party there offer no issue.

Financial

Large Sale of City Bonds

LAST week's sale of $37,000,000 in 3½ per cent. bonds by the city of New York (the largest quantity ever sold by the city at one time) indicates some revival of demand for first-class securities by the investing public. For the $32,000,000 of fifty-year bonds an average price of 100.94 was obtained. This yields to the buyer 3.46 per cent. The average for the $5,000,000 of ten-year bonds was 100.13, which yields 3.48 per cent. Prices realized were low, it is true, in comparison with those of two years, or even one year, ago; for the city obtained 106.23 for $7,500,000 in November, 1902, and 104.56 for $7,000,000 in January, 1903. Thereafter the price declined to 102 in July, 1903. Only 100.23 was obtained for $10,000,000 in January of this year, and only 100.10 for $3,000,000 in March last. An average now of 100.94 shows a turn of the tide and is encouraging. Of the fifty-year bonds, $21,163,500 was awarded to a syndicate composed of Kidder, Peabody & Co., Baring, Magoun & Co., and Fisk & Robinson, at 100.79. At prices ranging from 100.88 to 101.53, $10,000,000 more went to the two houses of J. & W. Seligman & Co. and Edward Sweet & Co. Of the ten-year bonds, $4,562,550 was taken by a syndicate including Harvey Fisk & Sons, Speyer & Co., Kuhn, Loeb & Co., the National City Bank, and Vermilye & Co. The bids amounted to six times the issue, and the bonds have since been quoted and sold at 102.

During the last eight or nine months great railway corporations, unable to market their long-term bonds at satisfactory rates, have undertaken to borrow not less than $150,000,000 on their notes. Owing to this and other evidence that the investing public—loaded with securities, some of them undigested and indigestible—would not buy, the approaching sale of this large quantity of municipal bonds had been regarded with some misgivings. The result, showing prices considerably higher than those of January and March, indicates a change for the better in the attitude of investors, and a perception of this change by leading bankers.

Financial Items

A BELGIAN company has obtained the contract for the cars to be used on the new trolley line in Manila. They are to be made of steel and teak wood.

....Reports from 445 street railway companies for 1903 show an increase of $20,193,000 (or 10½ per cent.) in gross earnings, while the gain in net earnings was $6,356,000, or 7¾ per cent.

....Fisk & Robinson publish an interesting industrial map of the United States, designed to show the advantageous location of the Gulf ports with respect to trade by way of the coming Panama Canal.

....The recent issue of $3,000,000 of Philippine certificates of indebtedness was awarded to C. S. Jobes, President of the American National Bank of Kansas City, at 101.181. They were afterward bought by Blair & Co., of this city.

....The American Locomotive Company has acquired, for $1,500,000, the Locomotive and Machine Company of Montreal, at whose works in that city, now approaching completion, it will supply the Canadian demand for locomotives.

....The new Japanese 6 per cent. loan of $50,000,000 is to be issued simultaneously in London and New York. Half of it will be underwritten here by a syndicate under the management of Kuhn, Loeb & Co. The head of this house, Mr. Jacob H. Schiff, now in London, had a private audience last week with King Edward, who desired, the press dispatches say, to express his appreciation of the fact that the United States and England were co-operating in large financial undertakings.

....Speaking of the recent purchase of the New Haven trolley system by the New York, New Haven & Hartford Railroad Company, President Mellen says that these electric roads were not bought because they competed with the steam lines, but on account of his company's belief that a large transportation business in the territory served by its

Insurance

What to Do in Case of Fire

Fire Chief Coots, of Indianapolis, Ind., has recently suggested a number of things that may profitably be done by the householder in case of fire "until the firemen come." These seem deserving of wide publicity. According to him the alphabetic necessity is not to get excited, but to keep your wits about you. The fire victim should make certain that a fire alarm has been turned in. When an alarm is sounded in good faith the department has no complaint to make because it happens that its services are not needed. It is better for it to get there too soon than too late. The inside door of the burning building should be tightly closed. So also with the outside doors and windows. When this much has been accomplished, remain outside and await with such patience as you can the coming of the firemen. They ought to arrive within two or three minutes under ordinary circumstances. Be ready to point out exactly where the fire is and the best way of reaching it. In a large number of cases fires start in the rear of dwelling houses, usually, it may be said, from the kitchen flue, or else from the furnace, which is frequently located under the dining room. Through the device of shutting the doors of the several rooms, both up and down stairs, the flame and smoke are prevented from spreading through the house. In many cases the fire department is thus able to confine the mischief to the original room in which the fire originated. If the inmates of the burning house have given timely alarm, and carefully attended to the foregoing, there is but little danger of a general spread of the fire. The suggestion made by another fireman, that the householder should at once ring up the department, take the canary bird and insurance papers and get out of the house and keep out of the firemen's way, is indeed a most excellent one.

It has happened more than once that the department has been seriously handicapped by attempts made by the family to save household goods and trinkets. Many times the firemen have been blocked while on their way to the upper rooms by furniture that was being carried down stairs, or by heavy trunks that have been dragged to the top steps and allowed to tumble down. If intelligence is used much can be done to protect property from the ravages of the flames. There is loss rather than gain in pitching ones effects out of doors, where, if it is not injured by the fall, it is more than likely to be trampled upon and damaged by the water thrown upon the fire. Paintings and pictures are among the things most easily ruined by heat and smoke. If the circumstances are favorable and there is time, these may be removed from their hangings on the walls of threatened rooms. Depend on the salvage corps, which responds promptly and understands the saving of household goods better than the owners ever can, because the members of this corps have the experience, strength and means with which to work. It is surprising to the onlooker how quickly household property can be gathered into the middle of a room and covered with protecting tarpaulins against injury by water or falling plaster. Sometimes if the precautions mentioned are faithfully observed, a fire may be extinguished through the use of chemicals with only nominal damage. In the words of Chief Coots: "Have faith in the fire department and the salvage corps. The boys will do the rest."

(*Continued from page* 1101.)

steam lines could be better and more economically handled by a comprehensive trolley system. Therefore, the company will develop the suburban trolley lines, without regard to the interests of parallel steam lines, and will extend the electric roads to neighboring cities which they do not now reach.

Survey of the World

In the Field of Politics

Friends of Judge Parker say that the support of Indiana's delegation points to his nomination on the second ballot. In the Indiana convention, by a vote of 954 to 468, a resolution of instructions for Parker and in favor of the unit rule was adopted, altho all the influence of Mr. Bryan and Mr. Hearst had been exerted to prevent such action. Hearst carried only one of the thirteen district conventions, but under the unit rule the two delegates from that district will be required to vote for Parker. There was a notable demonstration in favor of McClellan in the convention when one of the speakers mentioned his name. Since the adjournment of the Indiana convention, supporters of Judge Parker claim 494 votes for him on the first ballot, altho only 128 delegates have been instructed to vote for him. Instructions have been given, however, in the so-called doubtful States of New York, Indiana and Connecticut, and it is assumed not only that the votes of New Jersey and Pennsylvania will be cast for him, but also that instructions in his favor will be given in the Southern States whose conventions have not yet been held. It is predicted that at least 196 votes will be added on the second ballot, thus giving him 690, or 23 more than the needed two-thirds of the convention. Many contests will be brought before the Credentials Committee by the followers of Mr. Hearst. Some expect that the Hearst and Bryan interests will bolt the ticket and try to organize a third party, if what is called the conservative element controls the convention and nominates Parker. But Mr. Hearst authorizes the statement that he and his newspapers will support the nominees of the convention. In New York the continued opposition to the recent nomination of James T. Woodward and Harry Payne Whitney for the leading places on the electors' ticket has led Chairman Meyer to refer to a committee the question whether they are ineligible because they are officers of National Banks.—Speaker Cannon appears to have been taken at his word, and Congressman Robert R. Hitt, of Illinois, has been brought forward by the Republicans of that State for the Vice-Presidential nomination. At their convention last week (over which Speaker Cannon presided) the delegates were directed to vote for Mr. Hitt. For several years previous to 1881 he was in the diplomatic service. He afterward became Assistant Secretary of State, but for the last 20 years has been a Representative from a district in the northwestern corner of Illinois, and for a long term has held the chairmanship of the Foreign Affairs Committee. He is seventy years old. As a stenographer he reported the debate between Lincoln and Stephen A. Douglas. Some think the convention will insist upon the nomination of Mr. Cannon. Changes in the Connecticut Republican Committee indicate that the successor of Senator Hawley will be Samuel Fessenden. Among the State's delegates to the Republican National Convention are Charles S. Mellen, president of the New York, New Haven & Hartford Railroad Company, and Charles F.

Brooker, a director of the same company. In Washington, the Republican convention rejected by a vote of nearly two to one a resolution in support of Governor McBride's project for a Railroad Commission, which was opposed by the railroad companies.—Since the adjournment of Congress there have been published interviews with several Republican members who are of the opinion that there ought not to be any revision of the tariff in 1905 or 1906, if their party should be successful in the elections. On the other hand, it is reported that the President is in favor of a revision to be made at that time, and that some of the party leaders desire to adopt the system of maximum and minimum tariffs now used by several European nations.—The President intends to go to his summer home at Oyster Bay on or about July 1st, and to remain there until after he shall have received official notification of his nomination. He will then go to Washington, but will return to Oyster Bay in the latter part of July, and will remain there until late in September. He will receive no delegations there, nor will he make any political speeches during the campaign.

The New York Post Office

An investigation of the New York Post Office was made some months ago, by seven Inspectors from Washington, who recommended that Postmaster Cornelius Van Cott, his son Richard, and several other subordinate officers be removed or dismissed. Charles L. Robb, who succeeded Tyner in the Post Office Department and has recently become an Assistant Attorney-General in the Department of Justice, was directed by Mr. Roosevelt to review the Inspectors' report and make further investigation. He has done this, and in accordance with the recommendations of his report (which has been published) Richard Van Cott has been dismissed, but the Postmaster himself is permitted to retain his place. It is shown that Whitfield Van Cott, the Postmaster's brother, was appointed as a laborer upon the Postmaster's recommendation; that in two years $1,804 was paid to him; that he "was supposed to have inspected letter-boxes," but that "he performed no service whatever." He said he had reported to Richard Van Cott, who promised to produce the reports, but was "unable to find them." Mr. Robb says the Postmaster's "negligence in this matter was inexcusable," and that the $1,804 should be taken out of his salary. The appointment was "unnecessary and unwarranted." Richard obtained from his father leave of absence for forty days, with pay. He went abroad. Authority for this grant appears to have been given by Perry S. Heath or by Beavers, who is now awaiting trial. The $342 paid to Richard will be taken out of the Postmaster's salary. Richard has been Superintendent of Delivery, but appears also to have been really the Postmaster for much of the time. Mr. Robb says that "in the matter of appointments and transfers in the whole office he usurped the functions of the Postmaster," and that "the service has suffered thereby." Correspondence between him and Beavers "plainly shows that there was no attempt on the part of Richard Van Cott to comply with the classification act, and that he did not hesitate to evade the civil service law in appointments and transfers." Joseph Falvey, an employee under Richard's control, during a little more than a year and a half was absent from duty 259 days, for all of which he was paid. Concerning the Postmaster, Mr. Robb says:

> "While I am satisfied that Postmaster Van Cott has permitted his son to exercise a greater control of the office than has been consistent with its proper administration, and that he has not given the office as close personal attention and supervision as the needs of a great office demand, I do not think the evidence warrants his separation from the service."

But he recommends that the Postmaster be required to reclassify the employees without delay. Mr. Van Cott is a personal and political friend of Senator Thomas C. Platt.

Plans for Panama Canal Work

By an executive order, addressed to Secretary Taft, the President has placed the construction of the Panama Canal under the direction of the War Department and given instructions as to the government of the canal zone. All the work of the Commission is to be carried on and all governmental power in and over the zone is to be exercised under

the Secretary's supervision. The Commission is directed to make rules and regulations for the government of the zone and for military, civil and judicial administration; to establish a civil service for the government of the zone and the construction of the canal, appointments to be made as nearly as practicable by a merit system; to make all needful surveys and specifications for engineering, hydraulic and sanitary work; to make and cause to be executed all necessary contracts; to acquire private property essential to the construction of the canal. It is authorized to appoint a Judge, and is empowered to enact legislation concerning internal taxes, customs duties and sanitation. The people are to be subjected to the least possible disturbance; they are entitled, the President says, to security with respect to property, person and religion; laws are to be made and executed in accordance with the principles of the Bill of Rights. The members of the Commission are to be elected Directors of the railroad company. The Commission is empowered to exclude from the zone idiots, insane persons, paupers, criminals, persons afflicted with dangerous contagious diseases, anarchists, " and others whose presence it is believed by the Commission would tend to create public disorder, endanger the public health, or in any manner impede the prosecution of the work of opening the Canal." Lotteries and other kinds of gambling forbidden by our laws are to be suppressed in the zone. The President expresses his desire that every possible effort be made to protect officers and workmen from the dangers of tropical and other diseases and to improve the health conditions on the Isthmus. He appoints Commissioner Davis to be Governor of the zone, with power to grant reprieves and pardons. —John Findley Wallace, of Chicago, for several years past the General Manager of the Illinois Central Railroad, and previously well known as an engineer in the construction of railroads, bridges and river improvements, has been appointed chief engineer, with a salary of $25,000. About two years will be required for the completion of surveys, the making of estimates of cost, and the perfection of plans.—M. Bunau-Varilla has been appointed an officer of the Legion of Honor as an expression of the French Government's appreciation of his work in connection with the canal and the sale of the canal company's property.—Gen. Rafael Reyes said last week (being then in Venezuela) that only by putting an end to civil wars and by encouraging the forces of civilization and progress could the South American countries avoid dismemberment and prevent themselves from becoming the victims of what had been called the " manifest destiny " of the United States. His purpose was to reorganize Colombia upon a sound basis and to aid in the construction of the canal, in which the interest of the United States was really not so great as that of his own country.

The Moros Still Fighting

Evidence that the Moros of Mindanao have not been subdued is shown by the attack upon a detachment of the Seventeenth Infantry near Lake Liguasan, about 60 miles south of Lake Lanao, on the 8th inst. Datto Ali, one of the hostile chiefs, had been sending threatening messages to the American camp. Thirty-nine men, with their officers, went out to find him. They were ambushed near the east shore of the lake by a large force of Moros, who killed First Lieutenant Harry A. Woodruff (of New York), Second Lieutenant Joseph H. Hall (of Alabama), and fifteen of the soldiers under their command. General Wood at once sent a large force to recover the bodies of the dead and to punish the Moros.—At Manila, the trial of Dr. Dominador Gomez and Buenaventura Kalbaza has ended in their acquittal. Gomez, formerly a Spanish officer, and recently the president of the Democratic Labor Union, was arrested in September last upon charges of rebellion and insurrection. It was alleged that he had incited the ladrones to take up arms against the Government and had assisted them with the funds of the Labor Union. Kalbaza was president of the Nationalist party, and was arrested at the same time upon similar charges.—Mayor Patrick Collins, of Boston, answering a suggestion from the War Department as to the intended visit of the Honorary Board of Filipino Commissioners to that city, says that he " cannot see how the municipality can possibly be involved in their re-

ception and entertainment." The attitude of the Boston Chamber of Commerce toward the visitors appears to be like his. This Board, which is coming under the auspices of the insular Government and will arrive in San Francisco on or about the 28th inst., includes the Chief Justice of the islands and the two native members of the Philippine Commission.

Title to the Isle of Pines

At the recent session of Congress, action upon a treaty with Cuba conceding Cuban sovereignty over the Isle of Pines was prevented by Senator Penrose. This treaty having lapsed, another to the same effect was submitted. Action upon this also was prevented by the same Senator. The question of sovereignty was raised last week in the Treasury Department in connection with imports from the island, a claim having been made that upon such imports there should be the reduction of the tariff provided by the treaty of reciprocity with Cuba. Under the terms of the Platt Amendment the island was "omitted from the proposed constitutional boundaries of Cuba, the title thereto being left to future adjustment by treaty." As the treaty of reciprocity does not in terms include the Isle of Pines, the Department is inclined to insist upon the full duties, but may grant the reduction if it shall appear that Cuba gives the benefit of a similar reciprocal reduction to American goods imported into the island. Our Government has acquiesced in the administration of affairs on the island by the Cuban authorities. American settlers ask that the island shall be taken by the United States. There is now pending in the courts a suit in which the plaintiffs claim that no duty whatever should be collected at our ports on goods from the island, alleging that it is not foreign territory. President Palma recently said to Secretary Moody that if the island should be taken from Cuba, this would break the entire chain of the agreement between Cuba and the United States. Some have said it was never intended that we should claim this small island, but that there was an understanding that it should be formally ceded to Cuba after the acceptance of the Platt Amendment and following the cession or the leasing to us of the naval stations at Guantanamo and Bahia Honda. This appears to have been Cuba's view of the question.

Labor Questions

An act of the Kansas Legislature making it unlawful for an employer to discharge employees because of their connection with a trade union has been declared to be unconstitutional by the Supreme Court of that State, which says that a statute "imposing upon an employer the obligation of keeping one in his service whom for any reason he does not desire would be a denial of his constitutional right to make and terminate contracts and to acquire and hold property." —A newspaper in St. Paul is suing the local Bookbinders' Union for damages, to get a ruling as to an alleged violation of contract. A few months ago the newspaper made a contract with this union for two years, a part of the agreement being that that there should be no strike or lockout within that time. Afterward other employees formed a union, the publisher declined to recognize it, and a strike followed. In sympathy, the members of the Binders' Union quit work, but did this as individuals, they said, and not as a union. The newspaper holds that the union broke its contract. —At a meeting of the manufacturers of glass bottles, last week, it was decided that the factories should be closed for 90 days, beginning on June 15th, and that a demand should be made for a wage reduction ranging from 12½ to 20 per cent.—Traffic on the Great Lakes is interrupted by a strike of the Masters' and Pilots' Union, caused by the vessel owners' rejection of a demand for a wage increase which, they say, would amount to 14 per cent. They offered to pay last year's rates, asserting that they could not afford to pay more, owing to a recent increase in the cost of operation and the prospect of a dull season.—The arbitration plan adopted at the end of last year's memorable contest between the associated builders in New York and their employees was used last week for the settlement of a controversy with the Painters' Union, which had asked for a wage increase averaging about 12½ per cent. The arbitrators' decision, which was promptly accepted, gave the plain

painters the desired increase (from $3½ to $4), granted to the decorative painters one-half of their demand, thus raising their wages from $4 to $4¼, and retained the old rate for varnishers. This agreement affects 7,000 men.—A strike of 10,000 teamsters in New York appears to be impending. They demand higher wages and that union men only shall be employed.

Latin America

While nothing very startling is happening just now to draw the world's attention to our Southern sister republics, still there are a few recent events that deserve chronicle. In the first place, Peru and Brazil are at odds over the rich rubber region of Acre on the Bolivian and Peruvian frontier. It seems that recently Brazil demanded that the Peruvian troops should be withdrawn from this region within the limits recognized by Brazil as Peruvian territory. Peru as yet has not complied with this demand and accordingly Brazil threatens to send an expedition to drive them out. It is not expected, however, that war will ensue, for the whole trouble is owing to the vague wording of a treaty which can very easily be made plain and settled by arbitration.—In Venezuela there seems to be quiet, despite the fact that Congress has just declared itself a Constitutional Assembly and elected General Cipriano Castro dictator for a year with the title of Provisional President. The reason for all this is not yet evident, but it is said to have been done in order that Castro might put the new constitution in force which divides the republic into thirteen States and gives the President a term of six years instead of four. Castro has declared that he has proof that agents of the Bermudez Asphalt Company aided the insurrection led by Matos a year ago, after he spurned a bribe of a million dollars from them to have the courts declare in favor of their concessions in the fight with the Warner-Quinlan people. The American-Venezuelan Claims Commission at Caracas has cut down the claims of the Americans from $9,786,000 to $430,000. This shows the advantage of arbitration over war, for if the United States had forcibly attempted to collect from Venezuela her unadjudicated claims Venezuela would have been unmercifully robbed.—In Santo Domingo affairs are quieter than they have been for some weeks. The Dominican Government has agreed to pay an American creditor a claim that has just been awarded by a court of arbitration, and both parties seem satisfied. Minister Powell, however, has informed the Dominican Government that in the event of any foreign Power attempting to force a settlement of the claims of its citizens, thus excluding the claims of other Powers, he would in the name of the United States immediately seize the custom houses of the republic, put a guard in each, and protect the same in the interest of the United States creditors. Altho this action is based on the recent remarkable decision of The Hague Court, it has excited wide comment, since it is feared that unforeseen and dangerous complications might ensue were such a procedure backed up by our State Department. In the neighboring republic of Haiti a revolution is reported as imminent, and already some German warships are on the way to the threatened scene of action. No cause is given for the commotion.

Church Problems in Switzerland

Two practical problems have come into the forefront of discussion in Switzerland through recent developments—namely, the separation of State and Church and the rights of women to vote in the Churches. The former question has received a new impetus through the agitation in France. In the latter matter the Free Church congregation in Neuchatel has already given the women this privilege, chiefly because the men do not participate in the work of the Church, or because they are almost unanimously in favor of radical or even destructive measures. Other congregations as yet hesitate to follow this example, especially on account of the fear of family disturbances that would result from this innovation in giving women equal rights with the men. As yet no State or Church body has pronounced in favor of a separation between the two, but it is being seriously considered in many quarters. In the recent convention of the Synod of the Vaud canton a conservative pastor moved that the Synod make arrangements to

raise its own funds and thus become financially independent of the State, but the Synod, by a vote of all against four, decided that for the present at least the Church cannot get along without the assistance of the State. To what extent the women question in general is prominent in Switzerland can be seen from the fact that in the four Swiss Universities, Bern, Basel, Zurich and Lausanne, there are actually more women students of medicine than men. In the total enrollment of 1,654, the women contingent numbers 891 and the men 763.

For Universal Suffrage in Sweden

The agitation for universal suffrage in Sweden is reaching an acute stage, and a general strike is threatened, similar to that of two years ago, unless the promise made at that time for the extension of the suffrage is carried out. Meetings are being held in all the cities and in some rural towns, where the speeches of a violent and even revolutionary character are applauded. If a universal strike is ordered it will be more dangerous on account of the greater extent and power of the unions than the previous one, which involved almost all branches of industry from the dock men to the butchers, bakers, gas makers and theater employees. There are three projects proposed for extending the suffrage. The first is that of the Government and was prepared by Minister of Justice Berger. This has excited the opposition of the liberals and radicals because it provides for proportional representation in the Second Chamber, and they desire this principle to be applied at the same time to both chambers. The Liberal Union recommends universal suffrage to all above 25 years, with some restrictions, but without proportional representation. The Socialists want suffrage for all citizens above 21 years of age. It is not expected that any of these projects will be adopted this year. Of the 230 members of the present Second Chamber 104 belong to the Liberal Union, 90 to the Agrarian party (conservatives or reactionary), three are Socialists and 33 cannot be classed. Even if the Second Chamber should agree on an extension of the suffrage, it could not pass the Senate. At present suffrage is confined to citizens over 21 who have property of a taxable value of $280, or who cultivate a certain amount of land for five years, or who pay income tax on an income of over $225 a year.

The French Elections

The results of the French elections do not show any considerable dissatisfaction either in the rural or urban districts with the Combes Government. On the contrary, the Nationalist and opposition parties in general have lost ground almost everywhere. In the small communes there are no important changes. In the chief cantons the results are: Ministerialists, 1,475; Anti-Ministerialists, 837; undecided, 103, which indicates Ministerial gains of 135 places. In the city arrondissements (wards) the Ministry has gained 30. The Municipal Council of Paris is now composed of 36 Nationalists and 44 Republican Ministerialists. Previous to the election it stood 41 Nationalists to 39 Republican Ministerialists. The chief national issues were the foreign policy of the Government as shown in the negotiation of arbitration treaties with England, Italy, Spain and other countries, the settlement of the colonial disputes with England, and the maintenance of peace in every practicable way, and its domestic policy, as manifested in anti-clerical measures such as the law prohibiting members of the religious orders from teaching, the removal of the religious emblems from the courts, etc. Since, of course, local and personal issues play so considerable part in these elections, the results cannot be interpreted as indicating a clear, popular verdict on these questions, but it seems certain that the repeatedly predicted downfall of the Combes Ministry must be again indefinitely postponed.

Troubles in Turkey

The rising of the Albanians could not be put down by force, so after several encounters, in which the Turkish troops suffered at least as severely as the insurgents, and as the insurrection continued to spread, Shakir Pasha, Vali of Uskub, opened negotiations with the leaders, and, virtually conceding all their demands, prevailed upon them to lay down their arms. The

stipulations made by the Albanians are reported to have been (1), the promise of the Government not to try to impose any new taxes for two years, (2) the liberation of all the Albanians detained in the prisons of Uskub and Salonika, (3) the dismissal of all the Christian gendarmes, (4) the return of the Albanians exiled by Hilmi Pasha, (5) the immediate recall of Shemsi Pasha. The attempt to carry out in Albania the reforms imposed on Turkey by the Powers will have to be given up. Hilmi Pasha tried in vain to establish regular tribunals, open new roads and disarm the population. The imposition of a tax on cattle was the immediate cause of the revolt. Altho the Albanian trouble seems to be allayed, serious difficulties have arisen in the past month between the Turks and the Bulgarians, the Greeks and the Armenians. It was reported that the convention arranged between the Turkish and the Bulgarian Governments had removed all danger of war, but two fights have been reported from Salonika. The latest occurred on April 25th, at Lipa, near Demir Kapu, a valley of the Vardar, sixty-two miles from Salonika, and many were killed on both sides. The Bulgarian reserves for 1903, which had been sent home, have been recalled to service. At Smyrna, Mr. Delyannis, the Secretary of the Greek Consulate, came into conflict with the Turkish gendarmes, and was wounded and imprisoned. He was afterward released by the intervention of the French Consul, and the Ottoman Minister at Athens has promised complete satisfaction to the Greek Government for the injury to its representative. Severe fighting between the Armenians and the Turks is reported to have occurred in Sassoun district, but details are very conflicting, and since the scene of the hostilities is in such a remote province, it will require a month for the foreign consuls to go there on horseback and investigate the affair. Twelve villages are said to have been destroyed and the loss of life in the battle between the insurgents and the troops to have been 700 Turks and 900 Armenians. According to Turkish views, the insurgents are marauding tribes from the mountains, largely recruited from Russia and Persia.—The meeting of King Peter of Servia and Prince Ferdinand of Bulgaria at Nish has led to the belief that a triple alliance of Servia, Bulgaria and Montenegro is planned for the protection of the interests of the Balkan States.

The Tibetans Aroused

The Lamas have succeeded in rousing the Tibetans against the British, and the Mission is practically besieged in Gyangtse, altho at last accounts the communications with India had not been broken. Over 2,000 Khambi warriors are assembled at Gyangtse, and the camp is being bombarded with solid pound shot from a half dozen guns on a hight about six furlongs away. Half a battalion of Fusileers and half a battalion of Naval Infantry, with four 10-pounder guns from India, will be sent to reinforce the expedition. Mr. Brodrick, the Secretary for India, has informed the House of Commons that the Chinese and Tibetan authorities have been informed that the British Mission will advance to Lhasa unless they will negotiate at Gyangtse within a given date. It is rumored that the warlike disposition now being manifested by the Tibetans is due to the promise of Russian support, and that 125,000 Russian troops have been recently concentrated beyond the Caucasus.

The Japanese Advance

At Feng-Wang-Cheng the road from Korea divides into three branches: one leading southwest down the Liao-Tung peninsula to Takushan and Port Arthur, the second leading west to Haicheng, Niuchwang and Pekin, the third northwest to Liao-Yang on the railroad south of Mukden. In their former campaign through this same region in the Chinese-Japanese war of 1895 the Japanese forces divided at Feng-Wang-Cheng and followed the three routes, and this time they seem to be doing the same thing. The Russians are holding Liao-Yang, but they may intend later to fall back on Mukden. There are parties of Cossacks south of the Japanese and an attack was

even made on Anju, in Korea, on the Yalu, during the past week, but no serious oppposition is being offered to the Japanese march westward. The Russian cavalry keep in touch with the advancing columns, and there are numerous skirmishes, but no important engagements. The Japanese advance cautiously and fortify all strong points. Takushan, which is on the Ta-yang, the next river west of the Yalu, is in the hands of the Japanese and they are landing troops there. The Russian force in Korea consisted of 600 Transbaikalian Cossacks and 100 Ussuri Cossacks. They came from Liao-Yang, traveling at the rate of 25 miles a day. In the attack on the Japanese at Anju they lost fifty men killed and wounded, besides some prisoners. The fighting lasted all day, until, on the arrival of Japanese reinforcements from Kosan, the Cossacks retired toward the northeast.

Japanese and Russian Loans

Both the belligerent nations now find it necessary to replenish the sinews of war by new loans. Tokyo called for $50,000,000 on bonds, paying 6 per cent. and issued at 93½. Half of it was placed on the market in London and the other half in New York, and in both places the loan was oversubscribed many times, and prices rose to 95 and 96. A second popular loan for $50,000,000 at 95, payable in five years, with interest at 5 per cent., will be called for about May 20th. The Japanese credit is good, for almost all her loans have been paid off before the time set. Since 1868 Japan has borrowed $443,000,000, of which $163,000,000, or 36 per cent., has been paid off, and the whole was planned to be liquidated by 1945. The Russian Government is arranging for the issue of bonds to the amount of $160,000,000, payable in 1909, with interest at 5 per cent. The interest is to be paid semi-annually, and the bonds are exempt from all present or future taxes. It is expectd that most of this issue will be sold in Paris. The Czar has accepted $750,000 for the navy from the Patriotic Emergency Fund, which consists of several million rubles deposited in the Imperial Bank by donors to Alexander II.

Dalny

Dalny, the city which was designed by the best engineers of Russia and on which over $20,000,000 has been spent by the Government for the purpose of making it the center of Oriental commerce, is now either in the hands of the Japanese or at their mercy. It was the first port, open all the year, which Russia had attained in her century-long struggle by arms and diplomacy for that object. The edict for its construction was issued in 1899, and the docks, depots and public buildings were completed according to a general plan and in the most substantial manner by the labor of 25,000 men before the port was opened to commerce and the city to its future inhabitants. Talienwan, or Talien Bay, is capacious and of sufficient depth for the largest vessels. It is protected by a breakwater and its five long stone piers were provided with railroad tracks, warehouses and elevators, and supplied with gas, electric power and water. These piers and other public works have now been blown up by the Russians to prevent their being of use to the Japanese when the city should fall into their hands. A brave attack on the Japanese fleet blockading Dalny is reported from Russian sources. A young naval officer with three marines in a small naphtha launch slipped through the picket line of torpedo boats and discharged a torpedo at one of the cruisers, which was crippled and set on fire, tho not destroyed. The launch escaped the fire of the fleet and ran on the beach near Dalny. A Japanese torpedo boat was blown up by accidentally exploding a large mechanical mine which the Japanese were trying to remove from Kerr Bay, near Dalny. The boat was cut in two and sank in seven minutes. Seven men were killed. Port Arthur harbor is reported by the Russians to be free for the passage of war vessels. Telegraphic and railroad communication with Port Arthur is completely cut off, but it is claimed that there are 15,000 trooops in the city, all that can be profitably employed, and that they are provided with supplies and ammunition sufficient for a siege of nine months or a year.

The Democrats and the Presidency

II.—TWO JUDICIAL POSSIBILITIES—PARKER AND GRAY

[Last week our anonymous publicist discussed Cleveland and Olney. This week he takes up Parker and Gray. Next week he will write about Gorman and Cockrell, and the week after Bryan and Hearst.—EDITOR.]

IF manly beauty were the supreme test in determining who should lead the Democratic host this summer the competition would promptly narrow down to the two "possibilities" now on the judicial bench. Chief Judge Alton B. Parker of the New York Court of Appeals, and George Gray of Delaware, United States Circuit Judge, are both notably handsome men. Judge Parker

Judge A. B. Parker and His Grandson, Parker Hall, Under the Big Tree in Front of Rosemount

Rosemount—Mrs. Parker in Foreground

has the appearance and carriage of one who has led largely an open-air life. He is athletic of build, with a clear eye and wholesome complexion. Like President Roosevelt, he is a prodigious worker in and out of season, but keeps his splendid health by never letting anything interfere with his out-of-door exercise. If he is at his country home in Esopus, his day is likely to begin with a swim in the Hudson; if he is on duty at Albany, with a horseback gallop through the suburbs. But his gallop is always moderate in extent and decorous in pace and action; there is no clambering up dizzy steeps, no sliding down slippery trails, no leaping over hedgerows and fences, no pirouetting or *haute école* performances. Everything is strictly becoming the jurist of high degree. Socially, the Judge's manner is alert without flippancy, dignified without bumptiousness, suave without excessive affability. In short, he impresses you as a man who, tho not afraid of mixing in the hurly-burly of life, would never lose his equipoise, or be betrayed by a momentary excitement into an exhibition of hilarity on the one hand or of bad temper on the other. By this I mean not that his personality is colorless, but that its color is evenly distributed.

Judge Gray's appearance is notable both for the points in which it parallels Parker's and for those in which the difference is most marked. The facial features of the two men resemble each other in general contour. Both have good foreheads, from which the hair has receded enough to accentuate their breadth; both have strong brows and well-set eyes; both have aquiline noses; both conceal their upper lips under heavy mustaches. When it comes to their chins, Parker's is aggressive, Gray's stubborn. In expression, Parker's face is of the positive type that often goes with somewhat curly, auburnesque brown hair, while Gray's is more philosophic and subdued, as befits the smoother out-

line of his head. The reserve in Parker's manner, in spite of its obviously gracious purpose, conveys an uncomfortable suggestion of suspicion; you feel in its presence that you have not got underneath the man's shell—that if you enjoyed his confidence he would give you something which he is now studiously

From the *Pioneer Press*, St. Paul, Minn.

holding back while he edges away from you or gently pushes you off from himself; in this respect it is not so very unlike the manner of his friend David B. Hill, and it accounts for the fact that, tho his acquaintance is large, he has few intimates.

Parker is in the prime of life—still in the early fifties; Gray is about ten years his senior, but sturdy and well preserved. Parker is the sort of man you might pick up as a companion for a brisk walk; Gray's motions are slower—more indolent, perhaps, than labored—suggestive of the carriage-cushion rather than the cane. Both men are described by their admirers as of distinguished bearing. This is true, in a way; albeit Parker's stamp of distinction is that of the prosperous business man, self-made but not disagreeably conscious of it, while Gray's is that of ancestry and lifelong association. Tho both are tall men, you feel Gray's six-feet-one twice as much as Parker's five-feet-ten. Both dress well; but with Parker you are moved to admire his own taste and the art of his tailor, while with Gray you have only a gratified sense of fitness.

Gray impresses you as a franker man

"THAT OLD SWEETHEART OF MINE."

From the *State Journal,* Columbus, Ohio.

than Parker. When Parker is non-committal you conceive the notion that he has his mind made up but is resolved not to let you read it; Gray seems always to be pondering till some sudden exigency startles him into decision. Or, to put the same idea into another form, Parker is naturally partisan with a careful schooling in self-control, while Gray has naturally a tendency to weigh both sides of every question, which requires some effort to repress when he would take one side against the other.

It is always a fair question whether a judge ought to allow his name to be used at all in connection with an executive office conferred by popular election. In States with an elective judiciary it is, of course, inevitable that a good judge shall be proposed for re-election; but the consolation for this is found in the growing practice of uniting both the great parties on one candidate, thus taking the campaign out of politics in the narrower sense. The only temptation that can assail a judge who has his responsibilities seriously at heart, but who feels a natural ambition to succeed himself, is to make so excellent a record for the fairness and wisdom of his decisions that his neighbors will not listen calmly to any suggestion of a change. When however, he once lets his mind dwell on the thought of an elective office outside of the judicial field—one in which the questions will be not of equity, but of policy—it requires tremendous force of character to detect and resist the unconscious impulse to lean just a little one way or the other, indicative of a sympathetic interest in the subject of his own opinions. This is always unfortunate. It is almost equally unfortunate if, tho he have steeled himself against the slightest concession to this extra-judicial tendency, the public nevertheless insist upon suspecting him of it. Even indiscreet friends, with the kindest of motives, may in their zeal read into a judge's utterances from the bench a meaning which was not intended to be there, and the mere suggestion of which may prove distressing to a magistrate of sensitive temperament.

The two judges whose names are on men's lips as the Democratic national convention draws near differ widely in their antecedents and attitudes. George Gray was made a United States Judge at the close of a notable career at the bar and in legislation. The bench for him was an incident or a reward, as one chooses to view it; certainly it was not his choice as a life-work. But for the forlorn straits into which his party fell during the nineties he might still be a Senator from Delaware, and affirmatively eligible for the Presidency. Alton B. Parker of New York, on the other hand, has been so long a judge of one court or another that many of his warmest adherents know him by his title only, and not by his given name. He made his choice of the bench as deliberately as he made his choice of the law for a calling. He was the youngest man who had ever sat in the Court of Appeals when first appointed to that tribunal. Repeated efforts have been made by the managers of his party to lure him into accepting a nomination for this or that executive office, but he has closed his ears to all prayers and blandishments. He would not yield even in 1902, when the salvation of his party in New York State was represented to him as depending upon his consent to run for Governor. When a man who has loudly voiced his refusal of a long series of flattering opportunities maintains a studied silence in the face of another, the inference is inevitable.

This is why, by universal acceptance, Judge Parker is recognized as a candidate for the nomination to be made at St. Louis in July. Judge Gray, tho there would be nothing surprising in his candidature, has on several occasions taken pains to deny that his ambitions lie in that direction. That so many Democrats persist in discussing him in spite of this disclaimer is due undoubtedly to his prominence before the country in the Cleveland-Harrison period. Indeed, in 1892 he was regarded as the legitimate heir to the nomination at the hands of the Cleveland element in case they failed in their effort to carry their first choice through the convention.

I have never heard a reflection cast upon the uprightness of Judge Parker's character, or the perfect fairness of his attitude toward parties who have submitted their respective merits in controversy to his judgment. Yet in politics he takes the view that he is in a world by itself. I would not be understood as meaning that he knowingly winks at corruption, or anything of that sort; but he has grown up in a school in which effect counts often for more than reality, and he measures the conduct of other men in public life by the standards he acquired there. The idea that an officer of the State can give his whole thought with disinterested sincerity to solving the problems that confront him, and go out of his way to do inexpedient things because they would be best for the public interests, would apparently be foreign to his mind. This is assuming that the measure he applies to others is that which he would apply to himself in similar circumstances. Where he could see the plain separation between right and wrong, morality, immorality and unmorality, if he were required to follow one course or another he would undoubtedly choose that which was not evil; but he does not impress even those who have been thrown most closely into contact

"I AM A DEMOCRAT"—AT TIMES.

From the *American*, New York City

with him as a man who would gratuitously go in search of trouble by doing an unwise thing in response to a mere impulse of chivalry. He might, for example, refuse his approval as President to a measure which he believed perilous to the welfare of the country, yet it would be hard to imagine him stretching out his hand to throttle it in its infancy on his own initiative. No man knows, nor can his neighbors prophesy, how he would act in a great emergency until he has been tried; yet the estimates of old friends lead one to believe that, in a crisis like that of 1860, Judge Parker would have been more likely to play Buchanan's safe part than plunge into Lincoln's radicalism.

With Gray, on the other hand, politics is an ingrained part of life. He cannot separate and differentiate between his character as a man, a judge and a politician. He is often so deliberate in making up his mind as to provoke criticism for what seems to the public like vacillation. This is an injustice to him. The vacillator is a man who is one moment of one opinion and the next moment of another. Gray does not reach an opinion promptly, but once reached it sticks, whatever it may be, and its unpopularity will not tend to hold it back. This trait was conspicuous in the case of the horrible affair at Wilmington, his own home town, last year, when a negro miscreant was lynched by a mob. Nearly every man and woman in the country, of Gray's class, was too shocked at the incident to analyze the motives behind it; hence there was universal astonishment when he came out in a public interview and, while deploring the atrocity, found a measure of excuse for it as the working-out of an inevitable result from certain abnormal social conditions. Whether his fellow countrymen approved or not, understood or misunderstood his purpose, he saw no reason to withhold his opinions. It might be questioned whether Parker, in Gray's place, would not have felt it the part of wisdom to hold his peace, or at most to say the conventional things expected of a public man of his reputation and official prominence, even if in order to do so he were compelled to cloak heavily his personal sentiments.

Judge Gray has a political record; Judge Parker has none. Some of the Democratic managers assert that that is what makes Parker so available. They say that in its present state of mind and fortune the Democratic party needs a man who is unknown, and hence at whom no one can throw stones. They point to the familiar case of James K. Polk—not a happy choice of a parallel, in view of the fact that the country got enough of Polk in one term and acknowledged its mistake by not choosing him for another. They refer with even more assurance to the fact that Grover Cleveland was unknown to the people of the United States generally when nominated, and knew them quite as little, having traveled almost none outside of his narrow home bailiwick. Here the analogy is weak in an important particular; for, altho the bulk of his fellow citizens were not acquainted with Mr. Cleveland's record, the record was there for any one who chose to go in search of it. As Mayor of the city of Buffalo he had made a mark which had proved his strongest reliance in his campaign for Governor, and as Governor he had incurred the enmities for which General Bragg declared the decent element in his party loved him. All these things were an open book—one had but to turn the pages and read. With Judge Parker the case is different. It is no discredit to him that circumstances have prevented his showing what manner of man he would prove to be in certain contingencies: the simple fact remains. Perhaps he would have disclosed all Cleveland's strongest qualities, and others yet stronger; perhaps he would have faced difficult situations with more tact and not less force; still, such considerations are academic at best, in view of the circumstance that nothing in Judge Parker's career has ever put him to the test.

Is it possible, then, that Parker will be an untried candidate—that we have nothing whatever on which to base a forecast of his conduct in difficult situations, or even of his attitude toward public questions? Are we to be left in darkness as to his position in 1896, when his party was split in twain? Report credits him with having voted for Bryan. This indicates that he was willing to shoulder his part of the responsibility for the free coinage of silver; but why should he not let this be known positively? Other good and upright judges, like

Caldwell, of Kansas, have made no secret of where they stood in that crisis. Is it because the platform attacked the judiciary that he feels so great a delicacy about defining his position? He might, then, with propriety have indicated the limits of his faith in the nostrums of the Chicago platform.

Plainly speaking, all we have to fall back upon as an assurance of Judge Parker's opinions are his judicial decisions in cases argued before him. And what kind of an index do these afford? If they are confined, as they should be, to the Judge's interpretation of the law as he finds it, or to an enunciation of broad principles, they convey no information as to his personal views on any of the questions entering into the cases; if they are mere reflections of personal views on the subjects involved, then they are valueless as judicial opinions, and he not only deserves no credit for them but has laid himself open to the severest criticism; if nobody knows whether they belong in the one or the other category, of what use is it to cite them as indications of the policy he intends to carry out if elected President? Here is the dilemma in which a judicial officer without a political record finds himself when he permits the use of his name for an executive candidacy: the only construction honorable to himself which can be put

THE GOLD BRICK GUARDS.

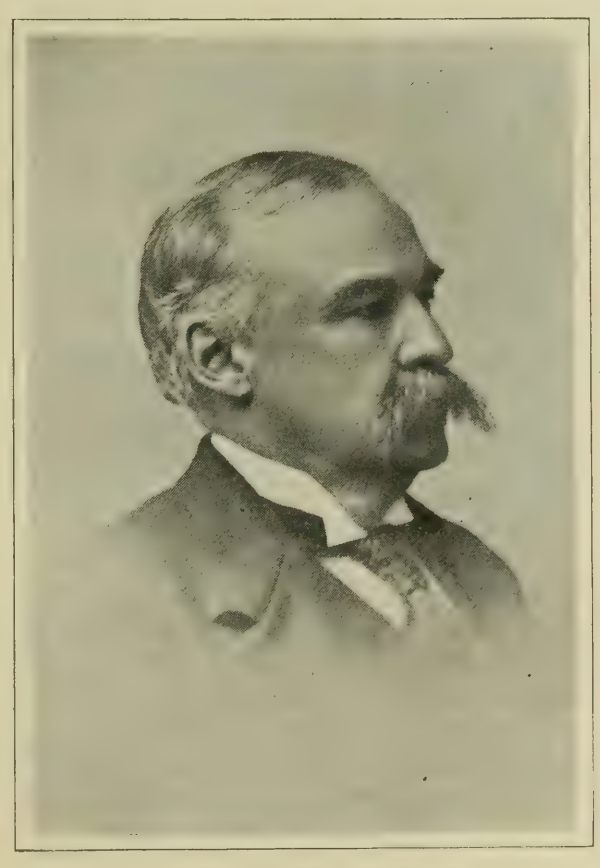
upon his utterances from the bench is one which robs them of all force as campaign material.

This consideration has not prevented sundry unwise supporters of Judge Parker from exploiting his judicial opinions as evidence that he is a "friend of labor." Some of these opinions voice the judgment of a majority of the court, some the dissent of the minority. An old crony of Parker's summed them up the other day as "presenting an average

A further embarrassment which attends the Parker canvass is that at no time prior to his nomination at St. Louis will it be practicable for him to acquaint his fellow citizens with his position on the public questions of the day. Delicacy would forbid his discussion of such matters while still on the bench; to resign his judgeship during the next few weeks for the purpose of freeing his tongue and pen would be equivalent to saying, in so many words, "I am seeking the nomi-

Judge A. B. Parker's Library at Rosemount, Esopus, N. Y.



of eminent fairness: where he has sided with the minority he has shown himself very friendly to the workingman; where he has sided with the majority he has shown himself not hostile to the capitalist." Altho this commentary was made in no cynical spirit, a mere inflection of voice might render it either a note of commendation or a covert sneer. Either construction would be an injustice to a man whose conduct as a magistrate has earned the unqualified esteem of his contemporaries of bench and bar.

nation," and would expose to misconstruction all his later acts and words. Not, therefore, till the die is cast, and it is announced that he has been chosen the standard-bearer of his party, can he throw aside his gown, step into the open, and make plain the lines on which he intends to conduct his fight.

It is claimed in Parker's behalf that he needs no better record to run on than the evidence furnished by his career hitherto that he is a man of destiny. The destiny argument, it will be remembered,

was used in both the Cleveland campaigns and in both the McKinley campaigns, and, as Mr. Roosevelt also is credited with a star of his own, this bit of sentimental logic is liable to be worn to shreds between the upper and the nether millstones of the coming summer's campaign. It is true, nevertheless, that Mr. Parker has enjoyed much good fortune, partly due to a happy conjunction of circumstances and largely to the recognition of his worth by his fellow citizens. It does not detract from the credit legitimately his own to recall the fact that his first appointment to the bench was received from the hands of David B. Hill, who felt that he owed his election as Governor in 1885 to Parker's good management as chairman of the Democratic State Executive Committee, and that Hill has since advanced his fortunes as far as possible; if Parker had not given a good account of himself wherever placed, Hill's aid would have been a handicap rather than a help. Nor does it signify to lay stress upon the element of luck in his election to the Chief Judgeship of the Court of Appeals in 1897 by nearly 61,000 plurality, because the Low ticket in New York City—the only Republican opposition worthy the name—carried no candidate for the Chief Judgeship; a reasonable analysis of the vote of that year indicates that he would have won anyway, as he had won his Supreme Court Justiceship in 1886, when his approved merit after a year's test as an appointee was handsomely acknowledged by the Republicans declining to put up a candidate against him.

There is no difficulty in acquainting oneself with George Gray's record in its every detail. From the time he became a national figure by succeeding Thomas F. Bayard in the Senate he has been constantly in the public eye in association with all the most important measures of government. It must be said of him, however, as of his friend Gorman, that he has never headed any advance movement of which the fruits will carry his name into history. His activities were mainly directed toward shaping legislation which others had initiated, and unquestionably his effective intervention has often saved the country from bad laws and made some good ones better. In the fields covered by the committees on judiciary and foreign relations he was most conspicuous, and as one of the recognized leaders in his party he had a hand in practically everything that was afoot. One of his most striking characteristics as a Senator was his impatience of any plans for the compulsion of men's opinions. He was a sound money Democrat, and approved of President Cleveland's convening Congress in extraordinary session in the summer of 1893 to act on the repeal of the silver-purchase law; but no Senator was more indignant than he when the President repudiated the best of the compromises broached during the fight that followed, and read the little group of Administration Senators a lecture on their duty to stand firm. Gray condemned the Sugar Trust's campaign for remodelling the Wilson Tariff bill in 1894, but felt that the President had exceeded his prerogative in chiding Congress in the now historic letters to Wilson and Catchings. One of his most vigorous speeches was made in January, 1891, in

JUDGE GEORGE GRAY

denunciation of the Republican effort to gag debate in the Senate and thus break the deadlock on the force bill. Deliberation is his own forte, and he will not tolerate interference with it in any responsible body of which he is a member.

His devotion to President Cleveland, in spite of occasional differences with him in judgment, was made manifest in 1895, when in the midst of the chaos into which the Democratic party had been plunged Gray came out boldly in favor of a third term for the President, taking the ground that Washington's apprehensions were confined to a series of terms immediately successive, and that the break in Cleveland's series would relieve it of any sinister significance. It was Gray also who, as a friend of the principle of international arbitration, came to Mr. Cleveland's defense when most other arbitrationists were condemning his Venezuelan message, and insisted that a rational reading of the correspondence would reveal the whole incident in the light of a magnificent protest against arbitrary and warlike methods, and a demand that the questions at issue be settled by resort to a peaceful tribunal.

The judicial temper of Gray's mind is never shown better than in the way he acts on his best information without any concession to precedent for the mere sake of surface consistency. He jeoparded the success of his party's fight against the force bill in 1890 by voting against the free coinage of silver in spite of the Gorman-Stewart combination, and six years later risked being read out of his party by refusing to support Bryan on the Chicago platform; and yet in the winter of 1897-98 he lent his countenance to certain financial measures repudiated by the gold-standard element and pushed by its opponents. He had nothing to gain and everything to lose by this apparent shift of position; but he did his own reasoning and drew his own distinctions as independently in this case as in the others, whether his critics could follow the processes of his mind or not. He was made a target in like manner for going upon the Peace Commission at the close of the Spanish war a vigorous anti-expansionist, and coming back a valiant defender of the Treaty of Paris, Philippine clause and all. Judge Gray's fairness of mind is evidenced by the constant demand for his services as an arbitrator in disputes which it is impracticable to carry into court. His most notable achievement in that line was his handling of the work of the Anthracite Strike Commission of 1902. It was this feature of his record which revived the discussion of his availability as a candidate for President.

My Thought of Thee

BY MARGARET BARTLETT CABLE

My thought of thee at morn is like a child
  Who comes with dancing feet and laughing eyes,
Kiss-laden lips, and joyous arms flung wide,
  To wake me from my slumbers by surprise.

At even my thought of thee is that same child
  Slow-creeping to his Mother's sheltering breast;
Small, clinging hands, soft smiles and drooping lids,
  Content to sink all silent into rest.

And, dear, through long night hours, my thought of thee
  Is like that child asleep, who softly stirs,
And smiles in dreaming of his Mother's kiss,
  And lifts his little fondling arms to hers.

NORTHAMPTON, MASS.

How to Write a Naval Strategic Article

BY CHARLES NOBLE, U.S.N.

[When a green youngster comes aboard a vessel he is sent on some fool message to "Charley Noble"—told that the captain wants to see "Charley Noble," and every one he asks misleads. Meanwhile the sailors congregate about "Charley Noble," the title they give to the galley funnel of copper fragrant with the odors of Uncle Sam's liberal bill of fare.—EDITOR.]

"The bearing of this observation lays in the application of it."—*Captain Bunsby.*

I AM a professional naval strategist and can be consulted on moderate terms. I make special rates to families and the Russian Navy. Nevertheless, I am now constantly in receipt of letters from war editors of newspapers requesting me to furnish them either gratis, or, what is the same thing, at "space rates," skeleton articles on naval strategy from which they can prepare thoughtful editorials indicating exactly (*a*) what the Russians are going to do, (*b*) what the Japanese are going to do, and (*c*) what either combatant ought to have done.

I have decided measurably to comply with this demand by letting THE INDEPENDENT print the following admirable paper on a purely strategic subject, which I intend shall serve as a standard for all time and for everybody. Anybody mastering its principles should be able to produce articles on naval strategy fully as instructive as any which have hitherto appeared.

The subject of a strategic article is always immaterial. Nor need the writer have any knowledge of it himself. Diplomacy, belles lettres, hydrostatics, theology, disobedience, or Asiatic geography—anything will serve. It should always begin with as long and as involved a sentence as possible. This weakens the reader's mind at the outset and prepares him for complete conviction of his own ignorance, while preventing any serious effort on his part to understand. It must always be remembered that the first principle of naval strategy is incomprehensibility, and that the moment a layman thinks he gets a glimmer of common sense in it the strategic quality vanishes. A classic opening sentence, which in various forms I frequently employ and always with stupefying results, follows:

"In considering any facts or circumstances, whether abstract, concrete, or the reverse, it is desirable at the outset to determine the existence, nature and possible concatenations of them, since it is naturally difficult otherwise to ratiocinate with respect to data whereof ignorance usurps that exact knowledge which alone forms an adequate—indeed, a sufficient foundation—and where discrimination itself has become repugnant to those principles which alone insure command of the sea the true utility of the ram brings us within rules which are less readily perceived than appreciated."

This sentence is copyrighted and must not be used by country editors as the basis of guessing contests or other competitions. It is recondite, impressive, and is entitled to great respect. It should at once be thrown into relief by illustrative anecdote, which, of course, should begin with a historical allusion to England's greatest greatness on the sea—something after this fashion:

"The strategic value of collisions takes its origin in one of those remarks of more than superhuman brilliancy which Nelson never failed to emit even under the most disheartening circumstances. It was during a lull in the firing at Aboukir Bay, when, as his custom was when not nervously twitching his abbreviated arm, he was walking rapidly up and down the half deck. Suddenly he was observed to stagger and would have fallen had not Rodney quickly caught him.

"'Are you hurt, my lord,' demanded the subordinate, while every one breathlessly rushed to the scene, eager to take down the reply.

"'No, Sir Ed'ard,' said the chief calmly, 'but I can lick the man who left that spit-kid in my track.'

"A thundering British huzza leapt from a thousand sturdy throats, and with the glorious banner of St. George at the peak the 'Vanguard' once more swept into the fray, and the battle was Britain's. Such was the result of a collision in which the embodiment of England's sea power played no insignificant part, and the lesson it teaches may well serve today."

Carefully refrain from explaining what the lesson is. It is much safer to say something to the effect that any attempt in that direction would constitute fetters which would neutralize intelligence and palsy individuality in a sphere and at instants when both are preeminently needed, or, on the other hand, permit a license which in practice would degenerate into anarchy. This makes the reader somewhat ashamed of himself and, besides, confuses him when he tries to imagine fetters palsying anything. Turn this at once into a sense of dependence on your infallibility; thus:

"But we cannot all be Nelsons—that is, not all of us—altho, including the present writer, there are several who might have been, had opportunities presented themselves which, unfortunately, kept out of the way. None the less, Nelson's prophetic utterance is not to be neglected. It is well worth while—very well worth while—not to ram objects which are difficult to ram, or even objects which cannot be rammed at all."

The simple profundity of this last precept is calculated to convince the student that the *finesse* of the maneuver is somehow within his grasp, and that a certain condescension has made him a virtuoso thereon, in criticism, if not in execution. He yearns for particulars and gets them in more anecdotes:

"When Lord Exmouth was blockading Guayaquil in 1806, on sighting a distant light, one evening, he unexpectedly ordered large numbers of rockets to be displayed. The vessel thus signaled bore rapidly down upon the flagship.

"'Wot's the matter?" roared the rough merchant skipper through his trumpet as the ships approached.

"'Sir,' said his Lordship in those piercing tones which at any time could easily overtop the shrillest bosn's pipes; 'Sir, I desired your proximity in order to apprise you that His Majesty's ship "Impracticable" is in this ocean and must not be collided with.'

"'Who in —— —— ——— wants to?' yelled back the profane mariner. 'Get out, you dumb, thickheaded bull beef Britisher!'

"Lord Exmouth merely smiled, and after lying down for two hours on the cabin sofa, wholly forgot the incident."

"An even more significant example occurred after Lord Howe had brilliantly avoided the French fleet in the harbor of Moscow and the "Victory" was closing in upon Admiral Villeneuve at anchor sixty miles west of Teneriffe. Sir Philip Broke, at the time a young lieutenant, was leaning on the bridge rail chatting with the chief engineer, who by the aid of a piece of chalk was endeavoring to explain why he had, some time before, essayed to run the engines backward and also forward simultaneously, and so had produced a perceptible hump on the berth deck just forward of the mainmast.

"Suddenly a hurried rush of steps was heard and Collingwood, in the lightest of *robes de nuit,* leapt upon the bridge. A hasty blow—he was always quick tempered—hurled the chief engineer clattering headlong down the engine room hatch.

"'Wha—wha—what do you mean, sir, by not reporting that light?' he demanded breathlessly of the deck officer. 'Wha—wha—what do you mean by it?'

"'Light!' said Broke. 'What light, sir?—No light has been made out.'

"'Give me them glasses!" hissed Collingwood, and seizing the binocular from the hands of the astonished officer, he directed it upon the bowsprit. 'There—there—dead ahead right under the bow. Hard a port—no—starboard. When I say starboard I mean port! Hard a starboard!'

"'That is not a light, sir,' rejoined Broke quickly. 'That is the evening star!'

"Collingwood gazed long and earnestly, and the star meanwhile considerately rose above the horizon. A deep sigh of relief convulsed him.

"'Let this be a lesson to you, youngster,' he said at last, gravely handing back the glass; 'never abate your zeal. Better report the evening star or all the

planets—yes, even the entire solar system—than risk one of His Majesty's ships in collision."

"So saying, he retreated to his cabin and had the doctor give him a nerve tonic."

Here you may philosophize as follows:

"To the thoughtful mind these instances indicate at once the strategic and to a marked degree the tactical importance of the ram if judiciously employed, altho, on the other hand, if it be not chosen with that degree of skill—that absolute and ineffable certainty which has never been attained by any one except their lordships, the defunct second-rate admirals of His Britannic Majesty's Navy, whose beautiful and pious lives and transcendent abilities should ever remind us that we can never emulate them and, indeed, never should try, then it would be as useless and idle an effort as would be the attempt to parse this sentence."

The reader is now prepared for opinions on the existing conflict, which may be judiciously presented as follows:

"The strategic position of the Russian and Japanese forces indicates that if the Japanese eventually succeed in capturing Port Arthur, its fall will be inevitable. But, on the other hand, much will depend upon the integrity of the Trans-Siberian Railway, which, if left uninterrupted by the Mikado's forces, will continue to offer an unbroken route. The trouble will also be complicated by the presence of submarines should either party have them, but hardly otherwise, tho even here there is doubt. While the true function of concealed mines is merely to vary strategic conditions, it is far from assured whether they should properly exterminate friend or foe, the Russians inclining to one opinion and the Japanese to the other. My own decision is that they are best utilized against newspaper reporters. These general facts constitute the data of the problem which confronts every official charged with studying any problem of war. As a general proposition, ships and land fortifications, if unequal, contend under disparity. Ships are much more useful and much more delicate than land works, but land works, on the other hand, are less likely to unforeseen submersion.

"Owing to the inherent non-buoyancy of guns and armor, it may be fairly concluded that ships will always be the chief factor in any maritime conflict; so that whether the Russian fleet be massed in a harbor of Southwestern Siberia or more prudently choose as its base a more distant point even better protected from high-angle Japanese fire, still the development of interior lines along the Tumen or Yalu will apparently force immediate fortification of strategic positions which cannot be here mentioned without infringing on the President's prohibition. That consequences will follow this strategy may be reasonably conceded, provided the events are not interfered with by circumstances which the prudent mind will never fail to anticipate."

Now, wind up with advice to the admirals who are doing the work. Set them well to rights. Nothing sustains the perplexed commander in his hour of need more than to know that your thoughts are with him and that if he only will rely on you all will come out well. He may and probably does know more than you, but he don't write and you do, and the pen is mightier than the sword in naval strategy, as everywhere else. Go it in this way:

"With regard to the naval commanders, whether they be Admirals Togo or Uriu, or Admirals Alexieff or Skrydloff, it is not to be doubted that they will not take action in any case without stopping first to ascertain what Lord Howe would have done in the same conditions. Nor will they act except under that time-honored rule which has always governed His Britannic Majesty's Navy and should control our own humbler and imitative organization—namely, 'No matter what you do, always protect the Administration.' 'It is His Lordship's victory, not mine,' said Nelson the day after Trafalgar, fondly gazing at the miniature of the First Lord of the Admiralty which he wore around his neck; and on that famous morning when St. Vincent dashed into Quiberon Bay there fluttered from the mast head of his flagship the ever glorious signal, '*The Strategy Board expects every man to do its duty.*'"

No one will fail to recognize in this an exuberance of thought and splendor of diction suggestive of Macaulay at his best. Perorate correspondingly:

"Those who look on the character of the ideal naval commander without fear

or malevolence will pronounce that of all the cardinal virtues the golden rule of military obedience, as we have defined it, is his only safe guide. His principles may be deliquescent. His 'art as true to policy as to Poll. His sympathy for the sufferings of a tormented and indignant syntax poignant and extreme. But if he leave the Administration responsible for anything, no matter whether it has ordered it or not, obviously he is wanting in the expected skill of the trained naval officer, and, most of all when he does not know it, is guilty of an error of conduct which will always be demonstrable by the flatulent possibilities of an overworked vernacular."

"'Bunsby,' said the captain rendering irrepressible homage to his genius, 'here you are! a man as can give an opinion as is brighter than di'monds.' . . . .

"'For why,' growled Bunsby, looking at his friend for the first time; 'which way? If so, why not? Therefore.'

"With these oracular words—they seemed almost to make the captain giddy: they launched him upon such a sea of speculation and conjecture—the sage submitted to be helped off with his pilot coat."

At Sea, Lat. 91° 30′ N.; Long. 183° 70′ W.

Tibet and Its Borderland

BY SARAH DOUGLASS McMAHON

[The author of the following article is a former missionary of the Methodist Episcopal Church in Kumaon, Gurhwal, India, where her husband, the late Rev. J. T. McMahon, was Presiding Elder. She has traveled extensively in the Himalayas near the Tibetan borderland. This article is based on private letters and correspondence from Dr. Martha A. Sheldon, who took the unique journey described here.—Editor.]

FOR hundreds of years Tibet, now about to be brought under British influence through the expedition of General Younghusband, has been an object of baffled curiosity to Europeans. It is an extraordinary fact that the earlier explorers were far more successful in their quest than recent travelers. The Englishman Manning in 1811 set foot in Lhassa, was admitted to the royal palace, and, presenting gifts, kowtowed thrice before the Dalai Lama, a smiling child of seven, who as the incarnate God of the Buddhists laid hands on the clean-shaven head of the daring visitor and inquired wonderingly how he had overcome the difficulties and dangers of the journey. Manning won the favor of the Holy Boy and his courtiers by a diplomatic reply; he said he had had troubles indeed, but they were amply compensated for by the happiness of entering into the sublime presence of the Sacred One. The attendants gave him tea and a present of dried fruits. He was received and dismissed with every mark of civility. He says:

"The Lama's beautiful and interesting face and manner engrossed all my attention. He had the simple and unaffected manners of a well-educated, princely child. His face was, I thought, poetically and affectingly beautiful. He was of a gay and cheerful disposition, his beautiful mouth perpetually unbending into a gracious smile which illuminated his whole countenance. I was extremely affected by this interview; I could have wept through strangeness of sensation."

Before Manning, near a score of Roman Catholic priests, and after him Fathers Huc and Gabet, in 1846, penetrated to the capital of Tibet, which it is now sacrilegious for a foreigner even to approach. The French fathers spent two months in Lhassa before being expelled. No white man living can boast of having entered the sacred city and gazed upon the Grand Lama. Clever, bold and resourceful as have been the later travelers, including the Russian Prejevalsky, the Englishmen Bower, Littledale, Landor and Wellby, the Frenchmen Bonvalot and Prince Henry of Orleans, the missionary Miss Annie Taylor, and the great American authority on Central Asia, William Woodville Rockhill, the Tibetans have succeeded in turning each and all back several days' journey from Lhassa. If

they have not penetrated to Lhassa, these travelers have in their several hundred mile journeys added much to our knowledge of the country and its inhabitants.

Tibet is more than the Switzerland of Asia. It is literally, as geographers are fond of terming it, the Roof of the World. Conceive an enormous table-land 1,600 miles in length from east to west and 500 miles in breadth from north to south, elevated from 10,000 to 20,000 feet above sea level, an alternation of desert steppes, frowning peaks and fertile river valleys; so cold that the inhabitants live like denizens of the Arctic Circle; so rich in mineral resources and other wealth that China, Great Britain and Russia dispute it as a prize; so inhospitable that wild animals as well as beasts of the caravan perish of starvation; traversed by Mongol nomads in its northern portions, inhabited throughout its fertile southern region by a priest-ridden, filthy and superstitious race; owning a more or less shadowy allegiance to China, but hating English and Russian interlopers with equal bitterness, and you have a succinct idea of the Forbidden Land now opening to the avenues of civilization.

Group of Bhotiyas, or Hill Tribe of Tibetan British Frontiersmen

The Tibetans are degenerate first because of their climate and second on account of their religion. Ethnologists have often remarked that mountain races quickly differentiate themselves from dwellers of the plains in features, frame, habits and customs. The high civilization of surrounding Europe has kept the Swiss from reverting to savagery. Not so with the Tibetans. Cold and poverty oblige them to be dirty. The frightful face of nature encourages superstition. The hard life has made them squat and muscular; it has dulled their moral sense as well, so that brigandage, drunkenness and polyandry are common evils. In appearance these mountaineers are square-headed, with small eyes, high cheek bones, prominent noses and large mouths. The men are clean-shaven and the women daub their faces with a brown pigment and wear their hair in strands almost innumerable, which are taken down and cleaned but once a month, with results that may be better imagined than de-

scribed. A common garment of the country is the whole skin of a sheep with the wool turned next to the skin. The women are often clad in a single garment of dark-blue serge, which is without fastenings, but is folded over in front and kept on with a girdle. Many of the Tibetans live in tents the year around, while the inhabitants of the more prosperous river valleys enjoy the squalid comfort of huts of brick, stone or mud, as the absence of timber in this wild land makes wooden dwellings impossible. The Tibetans are born traders. They get tea and silk from China, broadcloth, rice, grain and tobacco from India. They export silver and gold in quantity, likewise wool and salt (the staples of the country), yaks' tails, borax, musk and ponies. All the trading is done by means of caravans, which come by slow stages several months' journey from Pekin and in three to five weeks from the Indian border. Horses, sheep and yaks (the latter an enormous mountain ox) are employed as beasts of burden. Caravans must be large in number or well armed to withstand the attacks of brigands, who often belong to a religious sect and cover their depredations with the show of piety.

After all, religion, rather than commerce, is the keynote of the Tibetan character. The primitive rite of the mountaineers was devil-worship. Demons lurk in every pass, work their sorcery of disease and death on whole villages, entrap the unwary traveler into crevasses or raging mountain torrents, or destroy him with cold and hunger. Buddhism came in A. D. 638 and spread like a veneer over the ancient superstition. The Lamas or monkish holy men of the Buddhists simply took over the entire apparatus of magic and sorcery and converted it to their own uses. As the centuries passed they consolidated their power and secured a terrible grip on the minds, persons and fortunes of the people. The simple doctrine of the real Buddha or Sakyamuni, the ascetic founder of the religion more than five hundred years before the birth of Christ, was corrupted into a belief in the incarnation of six Buddhas or Grand Lamas, each the head of an important monastery, and each supposed to be the manifestation of the Deity in the human form. From this it was but a step to the belief in the Dalai Lama of Lhassa as the supreme living Deity. The lamaseries or abodes of the Buddhist monks are scattered all over Tibet. They are by far the most pretentious structures—sometimes containing as many as three thousand devotees—as the monks are likewise the greatest landholders and levy from the people both in state taxes and all manner of fees for the propitiation of devils. To the European the mode of worship seems compounded of mummery and magic. Ceaselessly revolving prayer wheels, in which is written a holy text or sentence, confer on the believer great merit both in this life and the life to come. There are also prayer flags, rosaries, amulets, scapulars and chortens or mounds of sacred stones. So similar are the rites and practices of Tibetan Buddhism to some of those of the Roman Catholic Church that Jesuit priests traveling in this land have guessed them to be borrowed from the Church of Peter.

While living for several years in the district of Kumaon, on the northern border of India, I had frequent opportunity of meeting the Tibetans. Altho the white man is rigidly excluded from the Forbidden Land, the Tibetans themselves and the hill tribes or Bhotiyas of India freely pass and repass over the frontier. Probably it was this spectacle which induced my missionary friends, Dr. Martha A. Sheldon and Miss E. C. Browne, of the Methodist Mission, to disguise themselves as Bhotiya women and take a daring excursion over the frontier to Taklakot, an important Tibetan trading post.

It is agreed by those who know the Tibetans that they are far from unintelligent, altho debased by superstition and vice. In many respects they are allied to our own Bhotiyas, and the two races do not find much difficulty in making themselves understood. Dr. Sheldon first came to Bhot, the British outland, with Tibet on the north and Nepaul on the east, in the capacity of a medical missionary. If ever a region needed medical and surgical expert attendance for its wretched inhabitants it was Kumaon. Bleeding and burning were the favorite remedies employed by the native doctors. The spirits were invoked and placated to prevent disease. "Holy men" who came down from Tibet were welcomed with open arms if haply their prayers and incantations might ward off the demons

bringing leprosy, smallpox and other scourges. Easily and naturally Dr. Sheldon displaced the native fakirs and became physician-in-chief to the Land of Bhot.

In summer the Doctor and her assistant, Miss Browne, live in their bungalow at Chaudas, 8,750 feet above sea level. In winter they go down to Dharchula, a more sheltered station only 3,200 feet in altitude. It is their custom to itinerate over their entire district in journeys 30 and 40 days' length at a time. On these excursions, besides the medical treatment, a great deal of religious work is done. Her first task in uplifting the inhabitants was to translate the Bible into the Bhotiya or hill country language, and next came the ambition to put the Scriptures into Tibetan. Here was a great difficulty. It is high treason for an inhabitant of Tibet to communicate the sacred language to foreigners. At last the ladies found a Tibetan pundit (by name Karma, a star) who did not expect to return to his native land and who taught them the written characters.

Over the high mountain passes between Kumaon and Tibet there flows during the summer months a busy stream of traffic and pilgrimage. In the coming and passing throngs are hill people on their way to trade in Tibet; venerable friars from the Buddhist monasteries; flocks of girls traveling in companies to make merry at a border village; kidnapping expeditions of young men seeking brides by violence, according to the ancient custom of the country; Chowkidars or frontier guards of the Tibetan Government; outcasts and beggars, who have traveled as far as Delhi, making a scanty livelihood by precarious street fakery. The passes range in altitude from 17,000 to 21,000 feet. Of travelers, the incautious, missing their footing, are dashed down deep crevices and ravines to death. The faint and weak-hearted fail in the terrible ascent, and some literally perish of heart failure in the extremely rarefied atmosphere.

Two Tibetans

Miss Sheldon and her assistant, Miss Browne, were uncompromisingly turned back by the Chowkidars in their earlier attempts to penetrate Tibet. During five years of such efforts they never succeeded in getting more than seven miles beyond the border. In the summer of 1902 they decided to make a fresh attempt. The objective point was Toklakot,

a trading center and seat of the local Raja, ten miles from the border. The brave women thought they might obtain an escort in the person of an influential Bhotiya, but they found not a single villager from the border towns would accompany them. The British subjects of Bhot know too well the punishment meted out to those who smuggle foreigners over the line. Mutilation and flogging are common punishments in Tibet.

Not the least difficult of the problems was getting into the native clothes. "The garments," says Miss Browne, "are not many but complex, but the way in which they are held up and draped is a secret. The skirt has no band and is held up under a sheet tied round the waist—altogether an uncertain way of fastening one's skirt, especially in the hands of a novice. The surplus ends of the sheet hang in front of the person. The upper garment is a long, wide sheet of woolen cloth, with an opening in the middle large enough only to allow of passing the head through. The headdress is made in the form of a bag sewn at the two sides." The outfit is completed by a pair of stout native boots for mountain climbing and a wicker basket carried on the back.

Dr. Sheldon's hope of getting through unobserved was through wearing the odd Bhotiya costume and keeping the head covering closed after the manner of women in India. A native girl taught the missionaries to step like the Bhotiya women, and, accompanied by a few of their servants and coolies bearing food, necessaries and a tent, they started out. Fuel also had to be carried, and a small goat was killed and cut up for the itinerant *table d'hote*. Ahead marched Gangwa, the faithful servant; the two pseudo-hill women followed, Indian file. The man had a pack on his back and a formidable looking bamboo rod in his hand. He waved it unceremoniously at natives who stopped and asked questions.

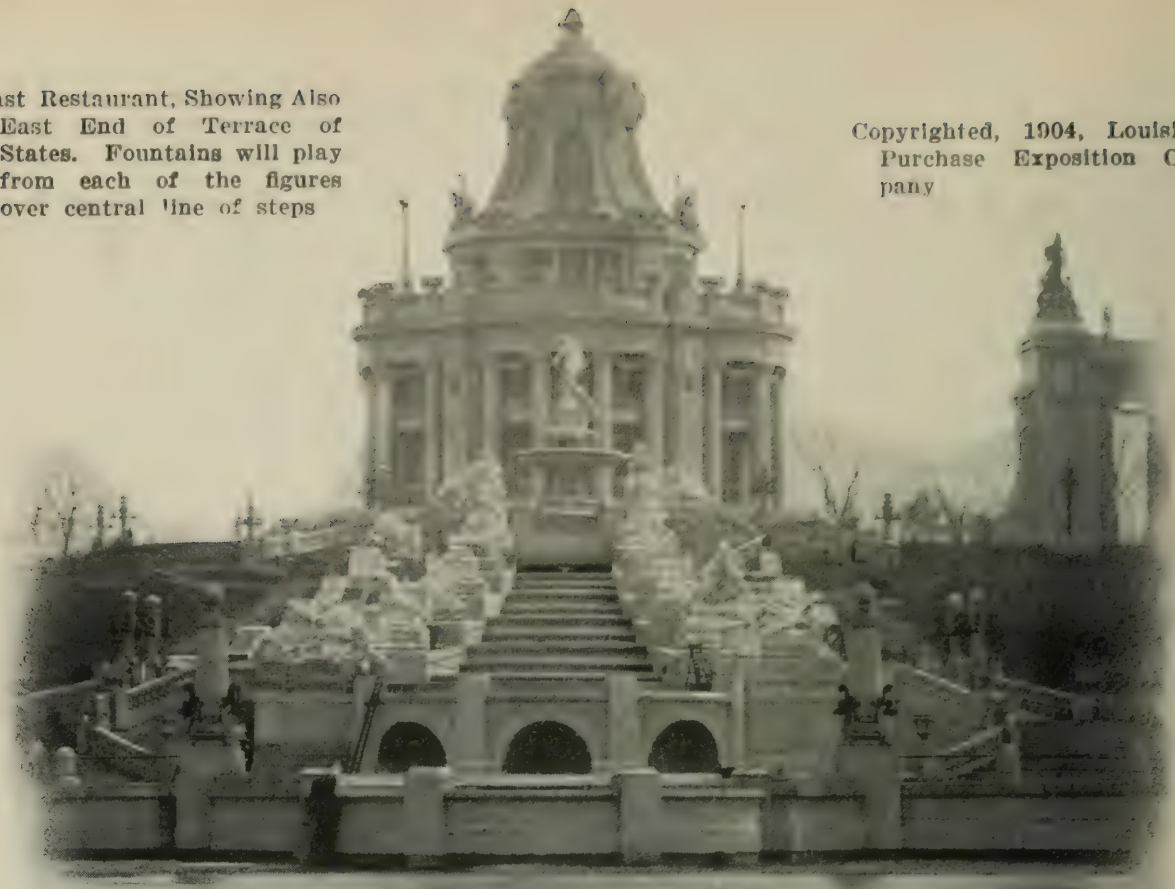
Going through the villages on the way to Taklakot the women had many narrow escapes from being identified and turned back. The coolies were persuaded not to walk with them (which might attract undue attention), but to carry the baggage a considerable distance in the rear. Down, down the mountain side came the party to the river which flows by the foot of the Tibetan city of Taklakot. Crossing the bridge, they found themselves among a crowd of Tibetans; but, going up the hill boldly, they landed among a colony of traveling Bhotiyas, and found a welcome resting place in a roofless hut, over which a tent was about to be stretched. This was the limit of the journey, and here Miss Sheldon said: "Send for the Raja and let him know that the *feringi* (foreigners) have come."

The arrival of the female travelers, who here threw off their disguise, was a

Peaks and Clouds in the Himalayas About Tibet

nine days' wonder to the Tibetans. Miss Sheldon and her assistant had time to hold a gospel meeting, to sing and pray, and to relieve the sick, before officials arrived on the scene and demanded their return to British soil. One of the patients was the Raja's son, suffering of toothache, which was relieved by Miss Sheldon's ministrations. Whatever the reasons for clemency—her kindness to the scion of royalty or the fact they were women—the Tibetans offered their unwelcome visitors no rough usage and even allowed them to stay over night in Taklakot, though annoyingly guarded by a couple of Tibetans, who occasionally poked their heads over the walls. The next day was Sunday, when they were obliged by the guards to commence their return march, which was uneventfully accomplished in the midst of a blinding snowstorm.

When Miss Sheldon's three-day twenty-mile journey into Southern Tibet and back is compared with Miss Annie Taylor's wonderful achievement some years previously in penetrating into the country from the Chinese border to within three days' journey of Lhassa it does not seem very significant. But Miss Taylor went through a sparsely settled land, where the vigilance against foreigners was not very keen. Miss Sheldon, on the other hand, eluded the watchmen, spies and emissaries of the monks guarding the southern passes against the advance of the British. Both missionary zeal and commercial enterprise anxiously await the entry through those passes of European civilization. That is why General Younghusband's expedition, which aims to compel the Tibetans to carry out their commercial conventions with his Imperial Majesty's British Government, and may, indeed, open up the entire country as Perry opened Japan, has the hearty good wishes of both English and Americans living in India.



BROOKLYN, N. Y.

Fancy and Imagination

BY HENRY AUSTIN

FANCY, that fine, elusive attribute
Of those who seek to marry rhythmic words,
Blithe Israfels,—"with heart-strings for a lute!"—
What is it other than the humming-bird's
Haphazard flight from flower to any flower,
Or aught that seemeth floral? Different far,
Imagination, in his towering hour
Of skyward soar, with naught his course to bar,
Dreamingly circling, swims the Abyss above,
Seemingly aimless; till, with sudden power
Of sure direction, like the homing dove,
He goeth straight, to brood on mind, on heart,
On spirit. Fancy is a bird in a bower
Of careless play: Imagination—Art!

East Restaurant, Showing Also East End of Terrace of States. Fountains will play from each of the figures over central line of steps

Copyrighted, 1904, Louisiana Purchase Exposition Company

HOW TO SEE THE FAIR

BY

WILLIAM LLEWELLYN SAUNDERS,

SECRETARY AND GENERAL MANAGER
OF THE
BUSINESS MENS LEAGUE OF ST. LOUIS.

ONE who visits the Louisiana Purchase Exposition for the first time may please himself best by coming in at the Lindell entrance. From this point by a short walk he reaches the open Plaza of St. Louis and the base of that lofty shaft, crowned by the statue of Peace, the Louisiana Monument, where he has an unsurpassed viewpoint for catching the inspiration of the Exposition. The Terrace of the States of the Louisiana Purchase at the brow of the hill, Festival Hall, the East and West Pavilions, the three Cascades descending in the midst of a beautiful landscape—this entire spectacle across the clear waters of the Grand Basin speaks at once in sublime language the appropriateness of an exposition to celebrate the hundredth anniversary of the "Deed of the Pen" which brought into the Union 14 States:

> "The land of the smiling harvests,
> For which no man has died."

After the first day the visitor may appear at some part of the grounds entirely different. The Louisiana Purchase Exposition has the advantage of entrances on the north and the south, the east and the west. The Administration Entrance, nearly a mile west of the Lindell, gives easy access to the buildings of foreign governments; directly opposite this, but distant the mile-long length of University Way, the Agriculture Entrance brings one into the forest, among hundreds of large, thriving trees, with the buildings of Agriculture and Horticulture not far away. The visitor may come

in at the southeast corner of the grounds, at the State Building Entrance, so as to lose no time in finding his own State building, if he be an American, or in enjoying the effect, if he be a foreigner, of the individualistic architecture in this plateau colony of buildings. And there are the possibilities of the Pike Entrance —that purely entertaining department in which, for the first time in exposition history, there are not shows by charlatans. Not to name them all, there are enough ways of getting into the grounds for a new view every morning of his stay, if the visitor should come to the Fair daily for two weeks. The entrances' different positions save time and tramping.

Returning to the impressions of the first day, a comprehensive view of the grounds is to be had by various means. For a fare of ten cents the intramural railway will take passengers its entire length of eight miles, skirting the principal buildings, or from any one of its seventeen stations to another. There are somewhat more expensive automobile tours along the central boulevards, and the chain of lagoons touching the eight chief buildings affords a two miles' circuit in gondolas or launches, at a fare of 50 cents. The college boy and his push-chair is within hailing distance in all parts of the grounds.

To remain until evening on this first day and see the wonderful illumination of the Terrace of States and the Cascade Gardens will fix the picture ineffaceably in the memory, not to be blurred by the detailed sight-seeing of succeeding days.

Individual temperament will determine the disposition of one's time among the exhibit buildings. The man is remembered who at the Columbian Exposition went every day for six weeks just inside the gates, where he sat listening to the exquisite playing of a Hungarian band. This was all that he saw or heard, yet he said he was repaid. If this man comes to St. Louis, he may never stir beyond the Art Palace. A farmer may come again and again to the 22 acres under roof in the Agriculture Building, where the culture of all the products of the soil is shown and the processes and products of their manufacture into commercial form. A man largely interested in mines may find other exhibits of no consequence as compared with the working gold mine, the Gulch, and all the equipment and resources known in modern mining, which are displayed in the building of Mines and Metallurgy.

But the multifold " average man " who finds nothing human foreign to his interest will seek to divide his two weeks, or whatever time he can spend, in such a way as to see something of everything in the Exposition.

Two hours is a minimum of time for passing through each of the eight large buildings connected by lagoons. One might begin with Varied Industries, to the west of the Plaza of St. Louis, where manufactured products are shown which have an artistic element in their composition. Across the Plaza lies the Manufactures Building, in which the exhibits are purely commercial. Following the out-

Site of Varied Industries Building, Facing Waterway. Transportation Building in Background, to the West (Marked by Its Tower). Copyrighted, 1904, Louisiana Purchase Exposition Company

Liberal Arts, Manufactures and Mines, Metallurgy Buildings (From Left to Right)
Copyrighted, 1904, Louisiana Purchase Exposition Company

side circle of the large buildings, the sequence of thought is continued in Liberal Arts—an exhibit of articles of commercial and educational value—splendid telescopes, liquid air in the making, and so on. In every building, be it remembered, whether it be manufactured wares or the products of the soil, or the achievements of science, it has been the aim of the Exposition to show these things in he making.

The Mines and Metallurgy Building lies across the Sunken Gardens from Liberal Arts, and beyond the lagoon to the

Glimpses of Machinery, Transportation, Varied Industries and Electricity Buildings (From Left to Right). The Pike in the distant background showing large blue dome of "Creation"
Copyrighted, 1904, Louisiana Purchase Exposition Company

west is the Education and Social Economy Building. There remain, in direct order, the amazing display of present-day applications of electricity; the Palace of Machinery, where the power, lighting and pumping plants of the Exposition are to be seen, aggregating 45,000 horsepower; and, finally, the Palace of Transportation, with 1,300 feet frontage and containing every modern vehicle of travel from the jinrikisha to the locomotive which weighs 200,000 pounds.

The course lies now to the foreign buildings. Great Britain's Orangery of Kensington Palace stands next to the highly decorative Chinese pavilion, Prince Pu Lun's country seat. Sweden's Farm House faces China, and to the west of these, similarly situated, are the buildings of Belgium and Austria, the latter conspicuously frescoed. France with her exquisite Grand Trianon has a large tract of ground a short distance south of Great Britain, with Cuba, Siam, Nicaragua and Brazil in a row between. Italy and the Argentine Republic, Mexico, India, Ceylon, Alaska and Holland are easily reached by walking. For Germany one would best wait until another day, as her Charlottenberg Castle lies more than half a mile away, beyond the Terrace of States. In this part of the grounds, however, Germany has a leading part in the Forestry Exhibit, in the Forestry, Fish and Game Palace.

The Philippine Reservation, just west of the Palace of Agriculture, will take as long as one chooses. Certainly a day may be well spent in viewing the villages, the walled city, the outdoor pursuits and the daily life of the 1,000 Filipinos who have been brought here.

The Agricultural Building, largest of any on the grounds, is adjacent, with its gardens, as also the Horticulture Building and the Live Stock Farms. Before leaving the west side of the grounds half a day's attention will be claimed for the athletic events occurring daily, the aëronautic course and the military barracks.

Japan's Shinshenden Palace and her smaller pavilions stand somewhat alone, on a rise of ground near the Machinery Building, just east of the Skinker road. One passes on, through the cedars of Lebanon and King Solomon's stables, southeast to the Palace of Fine Arts. It is well to bear this goal in mind, that enough time may be saved for enjoying

Texas State Building, in Shape of Star
Copyrighted, 1904, Louisiana Purchase Exposition Company

the pictures, the fine craftsmanship and the wonderful Court of Sculpture.

Nothing has been said of the United States Government Building or the Marine Corps or the War Field Hospital, or of the Model City, or of the Fisheries or the Life-Saving Exhibit. These are among the scores of things which will attract the visitor's attention as he goes to and fro between larger buildings.

Such profitable hours of studying civilization's achievements throughout the world may be relieved, and doubtless will be, by the "average man," in visits to the Pike. He will relax body and mind in the Tyrolean Alps, or in the villages, Irish, Japanese, Russian, French, Eskimo; or will find diversion in Hagenbeck's Animal Show, the Streets of Seville, or possibly Ancient Rome. The Creation, Hereafter, the Galveston Flood, Under and Over the Sea, Paris, and Mysterious Asia will invite many an unoccupied half hour.

Nor are these recreations very costly either in money or time. The adding together of all the admission fees to the more than thirty Pike "shows" gives a total of $20, and the Pike censor has computed that "Pikers may take their whirl down a mile of marvels in five hours and forty minutes, if they follow the pace of modern America." There are about one-fourth as many more entertainment concessions classed with Pike attractions, altho not situated in the Pike strip. Among these are Jerusalem, the Observation Wheel, New York to the North Pole and the Poultry Farm.

In all respects World's Fair visitors will find expenses in St. Louis no greater than in other cities of corresponding size in this country. St. Louis hotel proprietors have given written guaranties to the Exposition management that their rates will not be raised during the Fair. Long established leading hotels like the Planters, the Southern and the Lindell are charging, the Planters $2 to $4, and the others from $1.50 up, per day, on the European plan. The best hotels built for the World's Fair, notably the Washington and Hamilton, are from $2 a day up, and the Jefferson asks $2.50, European plan, as a minimum. Hundreds of good hotels and boarding-houses present varying rates, generally not less than $1 per day, but sometimes reaching as low a figure as 50 and 75 cents. Private families by the hundreds have opened their houses for lodgers, with the same schedule of prices as the hotels. Restaurants within and without the Exposition grounds are ready to furnish meals according to the pocketbooks of the visitors. Sixty concessions have been granted for serving meals and refreshments within the grounds. The rates

Washington State Building
Copyrighted, 1904, Louisiana Purchase Exposition Company

Some of the Three Hundred Transplanted Trees—Varied Industries Building
Copyrighted, 1904, Louisiana Purchase Exposition Company

asked for meals by the Inside Inn may be taken as a fair average—50 cents each for breakfast and luncheon and 75 cents for dinner.

This Inside Inn is under Exposition control, and is for the benefit of those who desire the advantage of being continually within the grounds, resting or sight-seeing at will. The Inn's capacity is 6,000 persons, and its rates include daily admission to the World's Fair grounds. Rooms with bath are from $3.50 to $5.50 per day on the European plan, or $5 to $7 per day on the American plan. From $1.50 to $2.50 per day, European plan, is charged for rooms without bath, or from $3 to $4 per day, American plan.

At every entrance the Exposition is convenient of access from street-cars, which charge five cents fare and come from Broadway in one hour. Three steam railways enter the grounds, bringing passengers direct from Union Station. Horseless vehicles are the only kind permitted in the grounds. The automobile service is under control of the World's Fair Auto Transit Company, which carries passengers in large coaches of thirty or forty to any point within the grounds at a rate of fifty cents from the down-town hotels or 25 cents from Grand Avenue. The admission fee, of course, is not included. The transportation arrangements are so satisfactory that on the opening day of the Fair nearly two hundred thousand people were carried to and fro by the steam and street railways without crowding and without a single serious accident.

St. Louis, Mo.

MRS. MAY WRIGHT SEWALL
President International Council of Women

MISS SUSAN B. ANTHONY

MRS. MARY WOOD SWIFT
President United States National Council of Women

The United States Delegates

TO THE INTERNATIONAL COUNCIL OF WOMEN

BY IDA HUSTED HARPER

[Mrs. Harper, who is the alternate to Miss Anthony at the forthcoming Berlin Congress, modestly does not say anything about herself in the following article. We therefore remind our readers here than Mrs. Harper is the author of "The Life and Work of Susan B. Anthony," and, jointly with Miss Anthony, of the "History of Woman Suffrage," including the general progress of women along all lines to the close of the nineteenth century. She was formerly one of the editors of the Indianapolis *News*, and for the past five years has edited a department in the New York *Sun* and contributed to the best magazines. Mrs. Harper prepared one of the Indiana State monographs for the Columbian Exposition and made addresses before several of its Congresses. In 1899 she was selected to speak on "Women in Journalism" at the International Council in London, and was elected chairman of the International Press Committee. At the Berlin meeting her address will deal with the question, "Why can women not vote in the United States?"—EDITOR.]

IN a few days there will sail from New York harbor, bound for a German port, a body of the most distinguished women in the United States, the delegates to the International Council of Women, and also the President of that great organization. Its brilliant meeting in London in the summer of 1899 is still remembered, when the delegates and speakers from many countries were received by Queen Victoria, while the Lord Bishop, the Rothschilds, the Duchess of Sutherland, the Countess of Warwick and others of the nobility entertained the noted guests with dinners, luncheons, teas, garden parties and other functions. The principal halls in London were none too large for the audiences, and the exposition there made of the organized work of women throughout the world was indeed a revelation.

Much curiosity and interest are felt in regard to this Berlin meeting, for it will undoubtedly be the most important gathering of women that has ever been held in the world. The German Council is in the hands of capable women and they are moving with much discretion and executive ability. Frau Marie Stritt, the president, who represented Germany at the Columbian Exposition, speaks English perfectly and is a woman of great beauty and power. Other prominent members of the official board are Baroness Olga von Beschwitz and Dr. Eliza Ichenhaeuser. Mrs. Sewall, who will preside over the sessions, speaks German as well as English, has no superior

as a parliamentarian, and is entirely at home in foreign lands. In 1889 she went to Paris as delegate from the National Council of the United States to the Universal Congress of Women, held under the auspices of the French Government in connection with the Exposition. In 1891-2 she visited most of the countries of Europe, conferring with many prominent people in the interest of the Congresses to be held during the Columbian Exposition. In 1897 she was delegate to the Congress of the Canadian Council in Halifax, and in 1898 to the one held in Ottawa. In July of that year she presided over the International Executive in London, and in August went to The Hague to assist in forming the National Council of Holland. In 1900 she was sent as commissioner from the United States to the Paris Exposition. Mrs. Sewall has assisted in the founding of over fifty clubs of women, and of men and women, and has held office in many national associations in this and other countries. As an organizer and executive officer she is equaled by few women and surpassed by few men. She was appointed by the Governor to represent Indiana at the New Orleans Exposition in 1884-5 and the Columbian in 1893. She holds the degree of A. M. from Northwestern University, and has been for over twenty years principal of the large and celebrated Girls' Classical School of Indianapolis, which is not outranked as a college preparatory institution. Mrs. Sewall was one of the founders of the Collegiate Alumnæ Association, and has written a number of books and articles on educational, literary and reform subjects.

The United States will be represented at the Berlin Congress by the President of its National Council, Mrs. Mary Wood Swift, of San Francisco, two delegates, and alternates for the three. Each country, large or small, is allowed but two delegates, thus securing an equal representation for all. Mrs. Swift was the wife of the Hon. John F. Swift, one of the prominent citizens of California, who was honored with many high offices. He was Minister to China, and died while Minister to Japan. Mrs. Swift had traveled extensively with her husband, spending six years at one time in foreign countries, and at home had found interest and contentment in the duties pertaining to society, church and club life. His death leaving her with a large fortune and no necessity for labor as a means of livelihood, she turned to public work for occupation and solace. She has been for a number of years State Regent of the Daughters of the American Revolution, and belongs to the Colonial Dames and the Society of the "Mayflower." She was president of the State Suffrage Association for several years and was an active worker and large contributor in the campaign for a constitutional amendment in 1896. As president of the Century Club and various other societies in San Francisco she has wielded a strong influence, while her many private benefactions have earned for her the warmest appreciation. Her home is a social center and is filled with beautiful souvenirs of her travels. Last summer Mrs. Swift journeyed from San Francisco to Dresden to attend the international executive meeting preparatory for the approaching Congress; in February she came from the Pacific Coast to Indianapolis to preside over the Executive for the United States to select the delegates and transact other business, and now she is *en route* for Berlin.

The American delegation will be headed by that veteran stateswoman, Susan B. Anthony, eighty-four years old last February. At the London Congress not one of all the world's eminent women received such an ovation as did Miss Anthony. None present will ever forget that night in Queen's Hall when three or four thousand people rose to their feet with cheers and waving of handkerchiefs as the grand old woman of America came to the front of the platform. There were more than one social function given for her which were considered by the hostesses too exclusive for any delegate or speaker to be invited. When all was ended and faces were turned homeward, Miss Anthony said, "Now, girls, you will have to manage the Berlin Council in 1904 without me." And here she is looking forward to it with just as much interest and pleasure as any woman who will attend, longing for the sea voyage, as she is an excellent sailor, and expecting to fulfil all the duties of delegate and speaker. There has been much anxiety among the German Council lest she might

REV. ANNA HOWARD SHAW
President National Woman Suffrage Association

not be able to come, as they are very desirous that their people shall see this great emancipator of women. It has been more than half a century since Miss Anthony went to her first convention, and she has wielded the gavel at more of them than any woman who ever lived. She laid it down at the National Suffrage Convention in 1900, when her eightieth birthday was celebrated, and was made Honorary President; but she still takes the keenest enjoyment in attending such gatherings, watching the modern woman preside with fine parliamentary skill, and listening to women lawyers, ministers, physicians and educators discuss the questions of the day with all the power and grace of the trained orator. She remembers that the first and the bitterest fight which she and the other pioneers had to make was that for the recognition of woman's right to speak from the public platform; the second was to secure their admission into the professions and industries. And so at this World's Congress in Berlin her heart will overflow with pride and thankfulness as she greets those who have come from far and near to represent woman's part in all the activities of civilized life. And they, in turn, at the sight of her face and the touch of her hand, will be thrilled with new inspiration and courage to toil, to persevere, to conquer.

The other delegate is Mrs. Kate Waller Barrett, of Washington, D. C., vice-president of the National Council of the United States. Mrs. Barrett is known on two continents through her labors as general superintendent of the Florence

MRS. IDA HUSTED HARPER

Crittenden Missions, established nearly twenty years ago by a wealthy citizen of New York in memory of a daughter. As the wife of the Dean of St. Luke's Cathedral in Atlanta, Ga., Mrs. Barrett was revered and loved for her philanthropic work, and in order better to minister to the sick and needy she took a college course and degree in medicine. She is a woman of fine intellect and remarkable executive ability, and after her husband's death, a number of years ago, the founder felt that in her he had found the one woman of all the world fitted in every respect to assume charge of the Crittenden Missions for unfortunate women. These now number 66, in this and other countries, and care annually for about

4,000 girls, finding permanent homes for them and extending continued protection. The National Headquarters and Training School for those who are placed in charge of these Missions are in Washington, under Mrs. Barrett's direct supervision. She has studied methods of rescue work in most of the European capitals and in Japan, China and Mexico, and she frequently visits the Missions throughout the United States and Canada, making personal inspection of their work. Mrs. Barrett was delegate-at-large and secretary of the Woman's Board of the Atlanta Exposition in 1895, was sent abroad to represent its interests, and was also a representative of philanthropic work at the Paris Exposition in 1900. She founded a medical college and training school for nurses in the South, and inaugurated and built a Home for Women, where an average of fifty women and children are constantly cared for. She is a strong writer and eloquent speaker, and among many expressions of commendation from prominent officials is a cordial and sympathetic letter from President Roosevelt.

MRS. HANNAH G. SOLOMON
President National Council Jewish Women

The alternate for Mrs. Barrett is Mrs. Hannah G. Solomon, of Chicago, founder and president of the Council of Jewish Women. She was a member of the Committee of Religious Congresses during the World's Fair in 1893, representing the Jewish women of the United States and organizing a very successful Congress. Out of this was formed the permanent association, now numbering 10,000 members, of which she has been continuously elected president. Its objects are a study of Jewish history and literature, and practical work in philanthropy, education and civics. It conducts manual training and industrial schools, kindergartens, mothers' and children's clubs, circulating libraries, reading rooms, free baths, employment bureaus and many other lines of public work. This Council contributed $10,000 in money and supplies to the Spanish-American War. Mrs. Solomon was one of the organizers of the Illinois Federation of Women's Clubs and its vice-president, is an active worker in the Chicago Woman's Club, chairman of one of the charity bureaus of the city, and widely known for her effective public work.

FRAU MARIE STRITT
President of the National Council of Women of Germany

The alternate for Mrs. Swift, the president, is the Rev. Anna Howard Shaw, of Philadelphia, president of the National Woman Suffrage Association, and frequently called "the feminine Demosthenes." Dr. Shaw was born in England, but has lived in the United States since early childhood. She holds three college degrees, having been graduated in Michigan, then from the theological department of Boston University, and afterward from its medical college. She studied medicine in order that when she carried spiritual help to the poor and unfortunate she would thus be able also to minister intelligently to their physical necessities. She was greatly disappointed after having been granted a degree by a Methodist Episcopal Theological College to be refused ordination by the General Conference of that Church. Finally she was ordained by the Protestant Methodist Church and had charge of one parish on Cape Cod for seven years. Meanwhile she had lectured extensively in Boston and other cities, and her fame as a speaker extended until it became evident that she would have to give up the lecture work or the ministry. She was deeply interested in temperance, woman suffrage and other public questions, and at last, moved by the earnest insistence of friends and her own conscientious judgment, she decided to enter the lecture field. There are not many Sundays, however, in which she does not fill the pulpit wherever her engagements have taken her, and few ministers in the entire country can so stir the hearts of a congregation. It is not an exaggeration to say that as a speaker she has no superiors. To an attractive presence and a rich, musical voice, she adds every art of oratory, and carries her audience through the entire gamut of emotions. Altho commanding a high price, she contributes probably half of her time to the reforms in which she is so deeply interested. She has held many official positions, is an able parliamentarian, an ideal presiding officer, and as delegate to the International Council in London, in 1899, was a strong factor in securing for the United States several measures of vital concern.

MRS. KATE WALLER BARRETT
General Superintendent Florence Crittenden Missions

Miss Anthony's alternate is her biographer and literary co-worker, Mrs. Ida Husted Harper.

In addition to those here mentioned a number of the most prominent women in the United States and Canada will attend the Congress as speakers. This is by far the largest organization of women in existence, numbering seven or eight million members. Twenty-three countries, extending entirely around the globe, will send their most representative women to this great convocation to tell what their countrywomen are doing and saying and thinking at this beginning of the twentieth century. The Council of 1899 produced such an awakening in Great Britain that it never has resumed its slumbering attitude toward the possibilities of woman. It is highly amusing for those who study modern tendencies and just a little alarming to contemplate the effect of this approaching invasion upon the deeply rooted traditions, prejudices and customs of the German Empire.

WASHINGTON, D. C.

Literature

Canada in the Twentieth Century

At last the Canadian Dominion, libeled abroad for so many years as a region of snow and ice, inhabited, according to the notion of the average householder in the English provincial town, by a race of mixed white and Indian blood, has had justice done to her by an Englishman who has lived long enough in Canada to understand and appreciate the people and record their life and progress. Mr. Bradley had previously familiarized himself with certain periods of Canadian history, and in his study of Wolfe and his volume on "The Fight with France for North America" had made some preparation for his latest book. But his *Canada in the Twentieth Century** is an intimate social study, a faithful representation of actual conditions, and affords a sympathetic insight into the aims and ambitions of Canadians which can only be ascribed to the new importance which the Dominion has attained in the mother country. The author declares his belief in a still more accentuated British interest in Canada in the near future, as his countrymen do not yet fully realize how great is the leap forward in every particular that the Dominion has taken in the last five years, and how immeasurably her horizon has broadened.

It is convenient, further, to indicate the scope of the work by mentioning some things which it does not attempt. Political forecasts and party strife are ignored; opposing views of the tariff are passed over, and altho the author sometimes reveals his free trade sympathies, he in nowise presses them unduly upon the reader's attention. Instead of a statistical and political exhibit, such as Sir Charles Dilke gave in his "Problems of Greater Britain," Mr. Bradley writes of the social life and manners, the buildings and farms, the natural resources, the historic associations of the older Canadian cities, and discusses with great minuteness and sound sense the requirements and propects of intending British settlers. Nor does he forget the beauty and attractiveness of certain Canadian districts to the tourist. He hopes, and we echo the hope, that the city of Quebec will never grow prosperously smoky in industry at the expense of its beauty and the flavor of its old-world interest. He points out the value of Canada to the sportsman; the fishing to be had in Quebec, the game in British Columbia, and he touches upon the measures taken to preserve and increase the resources of the Dominion in this respect.

It is one limitation of the book that it is written exclusively for Englishmen, and many questions which would be suggested if a broader viewpoint were taken are neglected. The annexation question, imperial federation, and Mr. Chamberlain's preferential tariff scheme do not figure among the discussions; but it is interesting to note the author's reference to American settlers in the Northwest. They are declared to be the very best settlers in that region, having a peculiar combination of nerve, buoyancy and enterprise which no other immigrant possesses. There does not seem to be any danger of political change wrought by what is often called the American invasion, for the simple reason that the "invader" is too urgently bent upon raising big crops or acquiring valuable live stock in the shortest possible time, and, moreover, finds the laws to be practically the same as in the Western States, only better administered. The author admits that it is impossible to value too highly the infusion of dash and initiative contributed by the settler from the Western States.

Compared with previous British books on Canada—those of Sir Charles Dilke and Goldwin Smith excepted—this volume is remarkably accurate. True, the author does state somewhere that Sackville-West, the British Ambassador to Washington, was recalled at the request of President McKinley; but that is not a Canadian matter, and, besides, it is a

* Canada in the Twentieth Century. *By A. G. Bradley.* New York: E. P. Dutton & Co. $4.00.

venial offense compared to the grave mistakes constantly made by British writers on America. We commend the book heartily to those interested in Canada as a country with an assured future to be developed partly by American enterprise and to a considerable extent in conformity with American ideals.

In Famine Land*

DR. SCOTT'S book is welcome, as it corrects the tendency of the unthinking to sum up the Land of the Sindhu as they would the United States or the British isles. The work is not only a portrayal of a famine stricken country as seen by the author in 1899-1900, but a good picture of India past and present. It is remarkable how the note of optimism sounds throughout the darkest pages. "One half the world does not know how the other half lives, it is said," writes Dr. Scott; "but recent events have shown that one half has been interested in keeping many millions of the other half alive."

A summary of famines in India prepares the reader for the story of the awful

* IN FAMINE LAND. *By Rev. J. E. Scott, Ph.D., S. T. D., Chairman M. E. Mission Relief Committee, Rajputana.* Harper & Brothers, New York and London. $2.50.

From "In Famine Land." Copyright, 1904, by J. E. Scott
Harper & Brothers, publishers

visitation of 1899-1900. A partial census taken in March, 1901, gave the following returns, but what the actual mortality was it seems impossible to find out: Ajmir-Merwara, 66,000; Berar, 144,000; Central Provinces States, 177,000; Hyderabad, 362,000; Baroda, 464,000; Bombay proper, 627,000; Central Provinces, 938,000; Bombay States, 1,167,000; Central India States, 1,816,000; Rajputana, 2,175,000. The death rate in the native states was shocking, the Viceroy putting it in one district as high as 15.21 per thousand. At Broach the monthly rate rose from 2.96 per thousand in October, 1899, to 24.83 in May, 1900. In the Panch Mahals the rate for the same month of May was 46.60 per thousand; in Kaira, 21.07; in Ahmedabad, 24.00.

The unprecedented amount of fifty millions of dollars was spent by the state and several hundreds of thousands were contributed directly by the people of America, while Germany, at the instigation of the Emperor, sent a liberal donation.

Accounts of suffering in Bhartpur, Jaipur, Phalera, Kuchawan, Merta, Bikanir, Ajmir, Kishangarh and a trip through famine lands are unutterably thrilling and horrifying. To starvation, at the worst stage was added an outbreak of cholera. Missionaries and officials doubled their labors, endeavoring to keep the natives from breaking camp and spreading disease throughout the Empire. But with all their work one-half of India became a great charnel house. The author writes thus of the scenes: "The genius of a Raphael or a Doré and the pen of a Dante would be needed to do justice to the spectacle. It will never fade from memory."

With the lessons of the famine he concludes his work. It is shown that humanity is subject to misery of this sort and how helpless the Indian peoples seem to be under such visitations. Natural law is irrevocable and the natives should plan to meet and handle such calamities. Effort ought to be made to adjust themselves to physical environment, lessen their expenditure and increase their savings. Above all, he affirms that there should be in districts where famines are common an extended system of tanks, lakes, canals and railways, so that food supplies could be maintained and transported expeditiously to the needy.

*

Sir Mortimer. By Mary Johnston. New York: Harper Bros., $1.50.

This is a story of Elizabethan days, when knight errantry had taken the form of commercial errantry, and when the greatest nobles of England were admirals and captains of pirate fleets that swept the Spanish main in search of treasure ships. The fortunes and misfortunes of the hero of such an expedition comprise this volume. The plot is simpler than that of the average historical novel, and, altho Miss Johnston is famous for the sword play of her fancy, there is no formal duelling. The fighting is on a larger scale, depicted, of course, with a woman's munificent ideas of blood and courage. And only those who have some practical knowledge of the battlefield will be able to detect the hazy unreality of the engagement between the English adventurers and the Spanish garrison at Nueve Cardoba, so fiercely do these brave phantoms rush to meet one another upon the "pallid hillside." In real life, however, it would have been little more than a blood splashed pageant, in which there was more harmony of color than dignity of action. Here, at length, Sir Mortimer is captured by the Spanish Governor, tortured, and made to believe that during the period of unconsciousness he divulged the plans of the English and betrayed his countrymen to their death. The remorse, disgrace and retribution of this proud man are the tragic features of the story. But the reader's interest will not depend so much upon the progress of the narrative as upon the manner in which it is told. Miss Johnston is the lady minstrel of historical fiction in this country, and her literary style reaches its highest development along the lines of romantic expression in this book. Every chapter is a canto of beautiful sentences; every character is a battle hymn in armor, a manly elegy of sorrowful human nature, or a pretty maiden pastoral of virtue and innocence. Never were mortals so decorated with prose laurels, nor the scenes of their exploits so etherialized by a sunlit, rose-tinted, mist-veiled imagination. And that which the author's vivid style has

always lacked before is here supplied by the tone of time. The splendor of her Colonial romances was garish, too new to be altogether acceptable. There were not enough long shadows from the past cast between us and the virgin greenness and gayety of that young world. We stood too close to her canvas in point of time and were blinded by the brilliance of her coloring. But the story of Sir Mortimer is shaded back into the dark corners of history. The cobwebbed beams of old taverns shelter it, there are long perspectives in it that end in the white glories of royal palaces, and the sentences in which it is told fall like bars of light across the faded tapestry of a gallant age. Occasionally an old English word is spiced in like literary frankincense from ancient poesy. And from start to finish there is the consistent illusion of remoteness, as if the reader, gazing back over the shoulder of time, beheld fair and stern visions of mere things long past. Altogether it is one of the most beautifully written books that has appeared recently, without being in any other way remarkable.

Singoalla. A Romance written in Swedish by Viktor Rydberg and now translated into English by Alex. Josephsson. New York: The Grafton Press, $1.25

This charming romance of Viktor Rydberg, which is now presented for the first time to the English reading public in a well done translation, is a stirring tale of gypsy spells and enchantments, of monasteries pillaged by night and skirmishes by day, and of love and heroic exploits. It deals with the love and adventures of one Erland, the son of Sir Manesköld (Moonshield), who, when a young man of about eighteen, meets, in the forest surrounding his father's castle, Singoalla, the daughter of the gypsy chieftain whose tribe has made its camp nearby, and he falls passionately in love wtih this strange maiden with the dark skin and the flashing eyes and the tangle of red beads around her neck. He asks her to meet him the next day at the same place, but she answers him that never will they meet again, and disappears in the woods. A year rolls around, when, one morning, a mighty creaking of wagons, tramping of horses and cracking of whips is heard in the forest—the gypsies have returned. Among them Erland recognizes Singoalla, more beautiful than before. How he goes through the gypsy mariage ceremony with Singoalla which makes them man and wife; how the monastery is pillaged of its golden and silver vessels by this band of gypsies; their pursuit by Sir Manesköld and his men, who discover in the nick of time before making a charge upon the marauders that Erland is held as hostage by them for their safe conduct; how he is brought back to the castle delirious and sick unto death from a poisoned drink administered to him by the gypsies; his slow recovery and the rising hatred in his breast of Singoalla, whom the prior leads him to believe is responsible for the poisoned drink; his final reconcilation with Singoalla after her many years of wandering through many lands with Assim, the mortal enemy of Erland and the rival but unsuccessful suitor for her hand, whom she constantly spurns, now her faithful slave and protector despite her cold indifference, and how at last the golden and silver vessels of the monastery are restored to their place again; all this and more we must leave the reader to discover. It is just such a book as one loves to read of a stormy winter's eve before the open fire, with the crackling and spluttering of the logs to keep one company. The illustrator, Carl Larsson, has admirably caught the spirit of the story, and his illustrations really illustrate.

The Evolution of the Soul and Other Essays. By Thomson Jay Hudson, Ph.D., LL.D. Chicago: A. C. McClurg & Co., 1904. $1.20 net.

To those familiar with Dr. Hudson's previous books this posthumous work presents no new doctrine, fortunately. The volume of essays, previously published in various magazines, shows the application of the author's well-known pseudo-scientific beliefs to sundry problems, with extremely satisfactory results so far as the author is concerned—or the reader comfortably endowed with appreciation of the humorous. The book may be heartily commended to workers in biological and psychological science. It will afford them relaxation. The effect, however, upon the non-scientific public is to be questioned. Dr. Hudson has such a generous way of evoking self-

evident (!) propositions, with constant appeal, none the less, to experiment and the logic of research, that the general reader is either convinced of the legitimacy of his conclusions or else alienated from all psychological research. In fact, the unqualified way in which Dr. Hudson takes unto himself the support of the "new psychology" must have a bad effect upon those who know little of modern psychological method and are not aware that there are new psychologies and new psychologies. Conservative science has, no doubt, recognized sensory and motor automatisms as evidence of greater psychical complexity than former psychologists dreamed of; but it is a far call from such recognition to the conception of a dual mind; particularly, when the so-called "subjective mind" has perfect memory, reasons by perfect deduction, possesses telepathic powers and an intuition that is akin to omniscence. Conformably to present thought-fashion, Dr. Hudson calls Evolution to the support of his doctrine with most startling results, as set forth in the initial and name-essay of the volume. One learns how the subjective mind, existing "independently of any specialized organ whatever," has controlled the process of evolution through the omniscence of instinct.

The Commuters. By Albert Bigelow Paine. New York: J. F. Taylor & Co. $1.50.

Albert Bigelow Paine has written more interesting and original books than "The Commuters," which both in theme and treatment suggests other books of "commuter" and "garden" *genres*. The amount of fiction which the country and suburban home with its garden has supplied is worthy of a special chapter in modern histories of literature. As for Mr. Paine's book, it is the story of a family who are tasting for the first time the "delights" of a country home. It tells of all the tribulations which accrue from house repairing and house furnishing; it speaks of the many petty inconveniences which the "suburbanite" suffers, not omitting the servant question, and it fairly sings the delights of country life and, of course, of the garden. More than this, it gives a view into the character of such charming individuals as "The Little Woman," "The Precious Ones," and "The Tiny Small One." Reduced to its elements, the story is really a textbook for those who, working in the city, would live in the country. It is a code, telling them what to do and what not to do.

A Little Tragedy at Tien-Tsin. By Frances Aymar Mathews. New York: Robert Grier Cooke.

There is plenty of color in Frances Aymar Mathews' book. Tho its title suggests China, as a matter of fact, just five of the fourteen stories which it contains, tho by far the best of them, have to do with that country; the remaining nine are laid in various lands and climes. It may be said of this collection of short stories that the ideas contained in all of them are distinctly fresh and original and that the treatment is on the whole worthy. If they do not rise to great hights, they do not sink to mediocre levels. The author just misses doing the big thing by striving to do the unusual and the striking. Her stories therefore lack that inevitability seen in the work of such an artist as Du Maupassant. They are interesting and in a way they have atmosphere, but they do not carry the conviction which forces a reader to remember them through the years with the vividness of an actuality.

The Woman's Library. New York: E. P. Dutton & Co. Six vols., $1.50 each.

In the first volume of this series of eminently sane and practical books addressed to women we find an interesting symposium on Education, especially that given in colleges for women. The standpoint is English, and the life described is that led by women students at Cambridge and Oxford. Information as to the fees required, the expense of living in the residential colleges, the examinations to be passed, and the social life of women students in England is of value, and it is not readily accessible elsewhere. Articles in other volumes are helpful to mothers. On the "Practical Care of Children" is by a physician, on "Nursing In and Out of Hospital" by a trained nurse, "The Ethical Training of Children" by an expert in that line, and all are full of wise suggestions. The fourth

volume discusses "Arts and Crafts" in an eminently practical way. Women's clubs can do no better than to invest in this Library.

Literary Notes

LATHAM'S DICTIONARY OF NAMES, Nicknames and Surnames of Persons, Places and Things (E. P. Dutton, New York, $1.50), is a handy book of reference for public and private libraries.

...."The Great Awakening of 1740," by Rev. F. L. Chapell (American Baptist Publishing Society), is an interesting study of the history of the revivals of the last century in this country and England.

....The Reciter's Treasury of Verse, Serious and Humorous, compiled by Ernest Pertwee (E. P. Dutton, New York, $1.50) contains 775 well-selected recitations, old and new, and is prefaced with a discussion of the art of speaking.

....Thomas Nelson & Sons, New York, publish a very neatly printed pocket edition of the New Testament and Psalms in the American Revised Version. The volume is only 3¾ x 4½ inches in size, in limp binding, the prices ranging, according to the material, from 30 cents to $2.75.

....Recent numbers of "The Worth While Series," published by Crowell & Co. (New York, 30 cents), include "Mary of Bethany" and "The Face of the Master," by J. R. Miller; "A Sailor Apostle," by Frank T. Bullen; "The Poet's Vision of Man," by J. W. Powell; "How to Be Self-Supporting at College," by J. M. Lee, and "Meditations," by Joseph Roux.

....Telling the character by the handwriting is quite as amusing and quite as reliable as using the bumps on the head or the lines on the hand for the same purpose, and one wishing to take up the subject will find detailed directions for the practice of this method of divination in "What Handwriting Indicates. An Analytical Graphology," by John Rexford (Putnam's, $1.25).

....Many attempts have been made to supplement the fragmentary knowledge of the Bible obtained from the use of the ordinary Sunday school lessons by some manual on the Bible as a whole. One of the most useful of such books which has come to our attention is the Advanced Lessons on the Books of the Bible with Relation to their Place in History, published by the Pilgrim Press (Boston, 50 cents). The historical setting and circumstances of composition of each book are given, and its purpose explained, with references and topics for deeper study.

Pebbles

PHILADELPHIA'S slowness seems to be a standing joke.—*University of Pennsylvania Punch Bowl.*

THEN AND NOW.

In days long ago (in the six-ties you know) when grandma went walking she held her skirts so.

What would she say if she saw girls to-day with skirts clutched so tight-ly they all look this way?

—*Inland Printer.*

Swiftly the wonders are gathering where
The proud city stands by the Father of Waters;
Soon we shall gladly be traveling there
With our wives and our wondering sons and fair daughters.
The tom-tom ere long will be heard on the "Pike,"
They are getting things fixed to send thrills coursing through us:
Soon the glad people may pack up and strike
The trail for Saint Looey—or is it Saint Loois?

The wonders are coming from distant Japan,
The sultans are sending their loveliest lulus;
Descendants of moguls from far Hindustan
Will parade down the "Pike" with big, barefooted Zulus.
Zuleima, Fatima and Selma will peer
From behind their frail lattices as we pass through; we
Will soon be assembling from far and from near
In gala Saint Loois—or is it Saint Looey?

The ladies will squeal and clutch madly at space
As the camels on which they have seats begin rising;
Ten thousand wild sounds will be filling the place,
We shall see wondrous things of man's clever devising,
But the most superb thing to be done by the Fair,
Which is splendidly planned to impart knowledge to us,
Will result if mankind may at last find out there
If the town is Saint Looey or merely Saint Loois.

—*Chicago Record Herald.*

Editorials

The Western Union and the Pool Rooms

"It is a moral question," says Mr. Jerome, "and not a legal one," which he puts hard at the conscience of the directors of the Western Union Telegraph Company. The gambling evil has had a tremendous growth of late years, especialy in connection with the races. These are carried on every day in the year, not out of love of sport, but to provide opportunities for gambling. Pools on the races have taken the place of the old lottery tickets, and they are just as bad, and just as illegal. And yet they exist.

How shall we abolish them? The way that would first occur to any one is through the police. They exist for the very purpose of closing illegal resorts. But the police do not do it; they find it more profitable to let them stay open. They say they cannot get the evidence on which to convict. We do not accept the excuse. Once, for a month, Boss Croker shut up every pool room in New York, and the police can do it just as well. They now and then dramatically raid some small card or wheel den, which depends on no outside service, but none of the principal racing pool rooms have ever been disturbed by the police.

But there is another way, and this Police Commissioner McAdoo and Mr. Jerome and Captain Goddard are telling us.

The fifteen or twenty racing exchanges in this city get their reports of the races by telegraph, and distribute them by telephone to minor resorts. If they cannot get reports they cannot exist. Now Mr. Jerome says that it is the moral duty of the Western Union Telegraph Company to refuse to serve the men who use the service to commit a felony. If this company serves them knowingly, it is aiding and abetting a felony. What it does in New York it does all over the country. It is in partnership with criminals, and its directors are the guilty men, and its stockholders are enriching themselves with the company's share of the pool-room crimes.

The trustees, or, rather, their Executive Committtee—for the trustees meet only three or four times a year—have published a statement on the matter that is far from satisfactory. They say that the company "will not knowingly permit its facilities to be used for any unlawful purpose;" that, further, it will withdraw its service of race reports from any pool rooms that the Commissioner of Police will specify as unlawful; and, further, it will hereafter give racing news only to such applicants as will promise not to use it for pool-room purposes.

If the Executive Committee of the Western Union think this will satisfy the moral sense of the public they are greatly mistaken. A man who plans to break the laws will break his word; his promise not to use the service for pool-room purposes is not worth a rush. To put the burden on the Commissioner of Police is of a piece with his attempt to put the blame on the Western Union. They do well to say that they "will not knowingly permit its facilities to be used for any unlawful purposes," but that is precisely what they have knowingly done and are still doing for money, being paid an extra price for aiding a felony. Captain Goddard went to them, told them he wanted to start a pool room, was directed to the proper racing news department, and made the agreement without difficulty, just as the big pool rooms do which purvey their news by telephone to the two or three hundred minor pool rooms, the sort which the police select for occasional dramatic closing.

If the Western Union really loves the laws well enough to refuse profits from breaking them, it should do more than it here promises. It should not give special favors to pool-room patrons. It should refuse to rush their news ahead of the messages of private patrons. It should not open offices at race tracks to be conducted in the interests of felons. It should refuse to run secret wires down

chimneys to conceal the evidences of felonious resorts. It should conduct its business in a way to make illegal acts difficult instead of easy. Then we may begin to believe that it really desires to earn honest money.

Why do we join with Mr. Jerome in this attack upon the Western Union? Not because it is more guilty than the gamblers or the pool-room men or the police, but because it is easier to get at the company. The whole thing can be stopped by killing it there. Egyptian kings loved to picture their enemies with a thousand heads and bodies united in a single neck, over which the king held his sword. Such a decapitation will be accomplished if the large telegraph and telephone companies shut off their service. Besides, the directors are supposed to be honorable men, high in esteem in the churches and in philanthropy. They are Oliver Ames, John Jacob Astor, William D. Bishop, William L. Bull, Thomas F. Clark, Robert C. Clowry, John K. Cowen, Chauncey M. Depew, Thomas T. Eckert, Louis Fitzgerald, Henry M. Flagler, Edwin Gould, Frank J. Gould, George J. Gould, Howard Gould, Edward H. Harriman, James H. Hyde, Morris K. Jesup, Charles Lanier, Charles Lockhart, John J. Mitchell, J. Pierpont Morgan, Russell Sage, Jacob H. Schiff, C. Sidney Shepard, Samuel Sloan, James Stillman, John T. Terry and J. B. Van Every. These are the men whom the public will hold responsible as abettors of felony, partners with thieves, if this service is not speedily stopped wherever possible. We are glad to see that Chauncey Depew and Jacob H. Schiff have said that this must stop.

Now one word further. It is not simply these men, some of them supposedly very good men, who will be proved guilty of hypocrisy if they continue to demand the profits of crime to fill their pockets, but also those journals which denounce them and which lament the prevalence of gambling, and mourn over clerks gone astray because they "played the races," while they also fill columns of their space with the racing news simply to attract and accommodate gambling patronage. All are tarred with the same stick. The racing columns and the racing editions are a disgrace to our press. We need a great strengthening of moral sentiment on the subject of gambling.

Women as Property

SOUTHERN juries that acquit murderers on the ground that a gentleman should not be punished for vindicating his "honor," are not the only bulwarks of barbarian ethics in this country. It appears that we have juries of like mind in the Empire State.

In a town on the Hudson River, the seat of a famous college for women, lived a man who suspected his wife of conduct not to his liking. He obtained a letter that she had written to her lover, appointing a meeting at a hotel. After reading, he sealed and posted it. At the appointed time, he appeared at the hotel, and, surprising his wife with her admirer, he deliberately shot the man dead. Indicted for murder he was tried before a jury of twelve married men. The facts were proven, and the jury has pronounced him "Not Guilty."

We have no doubt that thousands of men, yes, hundreds of thousands, in this State and throughout the United States, approve this verdict, even exult in it. They feel intensely upon the subject of what they are pleased to call any "invasion" of a husband's "rights," and have no hesitation in declaring that in vindication of their own masculine honor they would themselves commit homicide.

To all such men, and to all others that in some degree sympathize with them, we have a serious word to say. Your view of these matters, gentlemen, you sincerely regard as enlightened and high-minded. It is, in fact, a survival of barbarism, and if the world ever becomes really enlightened it will be condemned unequivocally.

This proposition we maintain on two grounds.

The first, of course, is that civilization cannot tolerate private vengeance, however great its provocation. The substitution of the feud or vendetta, systematically conducted by clansmen, for individual revenge, marks the first advance of mankind from the lowest savagery toward the higher social

order of barbarism. The substitution of an orderly legal procedure for the vendetta marks the further advance from barbarism to civilization. Every lapse from this procedure is a retrogression. It is treason to the rational conscience, and a surrender to pithecanthropomorphic passion.

No thoughtful American can follow the daily news without sorrowfully admitting that we are becoming indifferent to these lapses from civilized conduct, and that, even now, they are a menace to our whole social order. To condone private vengeance is to lend aid and comfort to the illegally disposed of every social rank, from the striker who throws bricks to the millionaire who betrays a trust. It is to encourage every form of violence, from the mobbing of a scab to the burning alive of an unconvicted felon.

The second ground on which we defend our proposition is one that probably is not so generally conceded by the general consent of men that think straight on most subjects, but it will not be disputed by many who have attained to enlightened views of the relations of man and woman. The verdict of the Poughkeepsie jury declares by implication that a wife is a kind of property, morally if not legally a chattel, whose husband owns her in a conventionally moral sense, very much as in a legal sense he might own a cow.

We assume that readers of THE INDEPENDENT are intelligent enough to discriminate between any apology for scandalous behavior, which we do not make, and an assertion which we do make, that in a civilized community a husband has no moral right to interfere with his wife's conduct by other means than advice and persuasion until she commits a breach of the peace; and no moral right then to interfere by other means than an outsider might lawfully employ. The laws of civilized States afford relief and redress to a husband whose wife has broken her marriage contract. Failure to fulfill the marriage contract does not give to the injured party a right to retaliate by fraud, deceit or violence, any more than failure by a vendor to deliver promised goods gives to the vendee a right to break and enter the premises of the delinquent.

The real moral question involved can be answered by any honest and clear thinking man by means of a simple test. Turn the case around, and suppose the husband to be the offender and the wife the injured party. Under these circumstances a jury would act rightly in acquitting a wife charged with murder, if it were convinced that her reason had been destroyed by emotional excitement. Would any jury knowing a good deal about the habits of men justify an offended wife in deliberately "vindicating" with gunpowder her right of property in her husband's affections? Reduced to this form the question becomes sardonic.

In a civilized community the relations of man and wife must be those of mutual love and confidence. The notion that husband or wife in any sense "owns" the other, must be given up, along with other notions that have come down to us from the ages of barbarism. When love and confidence cease to exist, moral decency and the law of the land demand that the disagreeing parties shall conduct themselves toward each other as they would conduct themselves toward other persons. When an aggrieved husband, instead of honorably telling his wife that he has discovered her altered state of mind, and agreeing with her what their relations thenceforward shall be, takes the case into his own hands, without her knowledge, to deal with in any arbitrary fashion, legally or illegally, he shows that in his secret heart he regards a wife not as a morally responsible personality —a human equal—but as a possession.

There will be fewer dissatisfied and delinquent wives when there are fewer husbands who regard wives in a barbarian way.

Connectionalism

WE suppose that a large part of our readers do not know what the word *connectionalism* means. It is a term applied to the bond of union which holds the churches of a denomination together, and is especially used by denominations of the Methodist type. Yet more specifically, it means the system which is the center within the circle of their bond of union—namely, that by which pastors are assigned to their churches, so that

every minister will have a church and every church a minister. Connectionalism is different from Episcopacy, for one Methodist denomination may have bishops and another none, but if it has any system which assures churches against vacancies and ministers against non-employment, this is substantial connectionalism.

Now the question of connectionalism is the chief difficulty in the way of complete union in some of the more important negotiations between denominations, whether in this country or in Canada.

For example, in Canada the Methodists, who have no bishops there, the Presbyterians, who are the leading denomination in wealth and social prestige, and the Congregationalists are planning for consolidation. A conference of forty representatives of these denominations, officially appointed, met a few days ago in Toronto, to plan for such a union, which all agreed was much to be desired. The Methodists had already some years ago formed a union of several minor bodies. The conference agreed that the time had come for uniting the three denominations in one body, but they did not devise any plan of union. They simply referred the matter to the respective general bodies, asking them to appoint committees to perfect a plan. But this was clear, that it is chiefly connectionalism that stands in the way, not merely the Presbyterian variety, which is simply a government, but the Methodist kind, which puts, or may put, a minister over a church, if not against its will, at least over its will; for this is the kind of authority which a church most feels, and a kind with which Congregationalists are not familiar, holding as they do that no body of churches has any absolute authority over any local church. It will be very interesting to learn how the committees will meet this difficulty, for they are very anxious that the union should take place.

It is this connectionalism that is the chief difficulty which delays complete union between the Methodist Protestants, the United Brethren and the Congregationalists in this country, and compels them at present to halt at the halfway house of a close federation. The two former denominations have a system of connectionalism to which they are much attached, while the Congregationalists enjoy fellowship enough, but admit of no authority by which any bishop, or superintendent or committee can assign ministers to churches. And yet Congregationalists confess that their own liberty leads to long intervals of churches without ministers and ministers without churches, much to the disadvantage of both. The connectional system also has its disadvantages in that it is generally connected with a limited term of pastorate, and sometimes gives offense to a church which receives a pastor it does not want.

It is a very serious question, which needs solution, whether a system of government by conference or presbytery over the local church can be made consistent with its independent freedom. Congregational churches do, as President Perry, of Marietta College, says in *The United Brethren Review,* through fellowship, all that other churches do through their ecclesiastical courts, but they do it by consent rather than by obedience. This is clear, that Church union must come under the law of liberty rather than of compulsion. May it not be possible either for the connectional system to be permissive, so that those churches that choose may employ it to secure pastors; or that those conferences that prefer the system shall adopt it, while those that prefer to assert their independence of it can do so? Certainly the evil of pastorless churches is a serious one from which the connectional denominations are delivered; and we do not see why Congregationalists or Presbyterians or Baptists should not, while maintaining their liberty, if they choose, make use of committees to place, if not to impose, pastors over such vacant churches.

Captain Mahan

SINCE the beginning of the Russo-Japanese War Captain Alfred T. Mahan has written a number of essays on topics more or less connected with it, notably in *Collier's Weekly* and the London *Times,* and most recently in the New York *Sun;* the last one dealing with "The Probability of the Survival of the Battleship."

We are unable to avoid the conclusion

that Captain Mahan's reputation may give these articles a weight with the public which their character does not justify. The discussion by a naval historian of topics as remote as Asiatic diplomacy, the maneuvers of the Boer War and the handling of armies in the field may perhaps be left to find their own level. But when he attempts to elucidate strictly naval problems, the case is different: for no matter how far they may be removed from the purely historical retrospects and deductions which have gained for Captain Mahan his high distinction, people will assume that his opinions are *ex cathedra* and, indeed, the last word of science in the matter. Where this is error, and where that error may ultimately affect the naval policy of the country, it is something to guard against.

Captain Mahan retired from active service in the Navy about eight years ago. With modern ships he has had no practical experience, nor as a naval officer did he achieve professional prominence. Indeed, when he exchanged the arduous duties of his calling for the literary pursuit there were few to question the wisdom of the choice. Despite public impression to the contrary, he is not, and never has been, acknowledged by competent naval experts as either a consummate tactician or a consummate strategist. There are many who deny his title to be considered a tactician or strategist at all, altho these willingly admit his ability as a historian. He served upon the so-called "Board of Strategy" during the Spanish War, and for a time apparently dominated the campaign. He shares in the responsibility for the "nervous anxiety" and vacillating methods which in the Navy Department replaced that assured and resolute grasp of the situation which the emergencies of war always demand. These facts cannot, of course, affect the value of opinions if based on sound premises. They suggest none the less that it is time to cease regarding Captain Mahan as a naval fetish and to accord to his strange divagations no more weight than belongs to the reasons which he may offer in their support.

Captain Mahan's discussion of the battleship question in the New York *Sun* does not clarify the matter, and in that it suggests a false issue it is likely to mislead. He institutes a comparison between the battleship and surface torpedo boats upon the obviously absurd hypothesis that the latter can be regarded as ships. He dwells upon the weakness and unseaworthiness and other well-known imperfections of these fragile craft, and as a matter of course finds them as ships far less formidable than the armor-clad. He apparently sees nothing to replace them, save an imaginary vessel to be rendered "immune" from torpedo attack by the simple process of making her draft of water less than ten feet. Where he got the singular misinformation that automobile torpedoes are not effective save at depths of ten feet and over is past conjecture. The fact is that they can be adjusted to travel under water at any desired depth from just under the surface down to a point below the deepest keel.

Even this "immune" vessel he avers must have a superstructure, guns, etc., and thus become "a target" (what vessel within human sight does not?), and so "you come at once again on the high road to the battleship," whence he concludes:

> "It will be impossible to contest the control of the sea by vessels immune by their draft from torpedo injury; and control of the sea is the one thing needful."

After thus discoursing through two columns he devotes a brief ending paragraph to the really imminent mattter of the offensive use of torpedoes by the battleships themselves, and as to this we had better quote his own deduction:

> "In default of experience only a careful restudy of the probabilities of gun and torpedo, not by technical, but by military experts, can reach a safe conclusion as to their relative values considered as factors in the armament of battleships and this again must be determined by a similar study of the tactics imposed upon fleets by the two weapons in their present state."

We freely confess that we do not know what this means, and with all deference to Captain Mahan, we doubt if he does himself.

Without going into the battleship question, which the criticism of Senator Hale upon the battleship as obsolete has now prominently brought before the country, and which we hope more fully to discuss hereafter, it may suffice to point out that the units for comparison are not the battleship and the torpedo boat,

but the battleship and the most efficient type of vessel differing therefrom which naval experts at the present day may be able to deduce from all the data now at hand.

No one denies the necessity of the control of the sea, altho the reasons for it, now that harbors can be made practically impregnable and blockades of very doubtful tenability, are becoming limited to the protection of commerce, food-ships and transports. Nor does any one dispute the fact—and we concede that we are venturing dangerously near to Captain Mahan's favorite region of platitude—that the control of the sea is to be maintained by ships. But whether the battleship is obsolete or not therefore depends upon whether or not conditions have arrived which demand its replacement by a new type of sea-going vessel, just as the battleship itself became substituted for an earlier type. Is such a new and better type of vessel now realizable? In the face of this problem the ineptitude of expatiating on the weakness as ships of the mosquito craft which have no function save to carry torpedoes within range of their target, or on the amusing and mistaken conceit of the "immune" ship, needs no further discussion.

The Orphic utterance about torpedo warfare at sea is especially confusing, since it conveys the impression that the subject has not been already well studied, and is not attracting the intense interest of naval experts everywhere. No fact is now better recognized than that the naval action of the future, instead of beginning with guns and ending with torpedoes, will begin with torpedoes and end with guns. Nor is anything plainer than that, in this same action, instead of air filled with projectiles, there will be water alive with torpedoes. We can project automobile torpedoes now from cruisers and battleships over distances between two and three thousand yards, and there is every probability that before long we shall be able to do so over four thousand yards. This last distance is beyond the efficient fighting range of the guns. Furthermore, the accuracy of flight of the torpedo is greater than that of the armor-piercing shell. Not only can approaching fleets now deliver their torpedo-fire before their guns can come into effective play, but it requires nothing more than simple mathematics to see that when two squadrons approach, as they must, at an angle with the usual interval of 400 yards between the successive vessels, torpedo hits can be counted upon in the proportion of one in three. When each ship so fires, as she can easily do if properly equipped, not one but half a dozen torpedoes simultaneously, a great change not merely in the coming sea fight but in the vessels which wage it is already within sight. We have already made notable advances toward rendering the battleship obsolescent. That it is already obsolete is doubtful, and Captain Mahan's opinion that it is not, which he certainly shares with most naval officers who have *not* served on battleships, may be altogether right; but there is nothing to learn from his present argument, and it affords no support to his conclusion.

The Cost of Living

OWING chiefly to a subsidence of speculation in our markets and a loss of activity in some of our industries, the cost of living—now considerably greater than it was a year ago—will be an issue in the political campaign. The increase from May 1st, 1903, to May 1st, 1904, is shown by Dun's index number to have been from 98.561 to 102.208. In a bulletin issued a few days ago by Col. Carroll D. Wright, Commissioner of Labor, the changes in wholesale prices during the last thirteen years are set forth. The index numbers of certain commercial agencies and economic authorities, it should be understood, have been published for many years and are based upon a study of current prices. In making a just average and reaching the result, substantially all of the representative commodities that enter into consumption are considered, in quantities apportioned according to their relative importance and the consumption per capita.

Dun's index number, for example, for May 1st of each year shows an advance from 72.455, in 1897, to 102.208 in 1904, or an increase of 41 per cent. in the cost of living in these seven years. Bradstreet's calculations, the results of which are indicated in another way, show an ad-

vance from 6.5119 on July 1st, 1896, to 9.0502 on May 1st of this year, or an increase of about 39 per cent. Colonel Wright's inquiry ends with the year 1903, comparing the average cost of living in that year with the cost in preceding years and with the average for the ten years ending in 1899, which he calls 100. It shows that the average relative prices of all the commodities considered was higher in 1903 than at any time in the preceding thirteen years. The advance since 1897 was from 89.7 to 113.6, but at the end of 1903 a rising tendency was observed. The cost of fuel and lighting showed a remarkable advance, being higher in 1903 by 49.3 per cent. than the average for the decade ending with 1899. For refined petroleum the increase from March, 1893, to December, 1903, was 100 per cent. Colonel Wright's bulletin fills a volume of more than 100 pages. The index numbers to which we have referred bring the statistics down to date and include some expenses of the average family that were not within the scope of his investigation.

The causes of this increase of the cost of living are many, but prominent among them has been the maintenance of high prices for certain products of manufacture during a "boom" period by agreements and combinations designed to secure profits that would yield dividends upon watered capital. Successful attempts to fix and maintain such prices have suggested and been followed by increases of wages that have added to the cost of production. Thus the burden of higher cost of living has been much lightened, if not wholly removed, for a large number of persons so long as the demand for manufactured products continued to be exceptionally strong. By many persons of moderate and fixed incomes, however, the burden has not easily been borne.

The condition of the iron and steel industry, always an important factor in the situation, illustrates some of the influences and tendencies that must be considered in any study of this question of prices and the cost of living. Last week the price of Steel Corporation common shares fell to $8\frac{3}{8}$, and that of the preferred shares to $51\frac{1}{4}$. On the 3d inst. the association or pool by which the price of iron ore has been fixed and maintained was dissolved because the members of it could not agree. The price of standard Bessemer ore had been $4.50 per ton; it has now fallen to $3. Declining demand for iron and steel products, especially noticeable during the last few weeks, affects the entire industry. But the combinations that control the supply of finished forms of various kinds insist upon maintaining the high and artificial prices which they were able easily to exact in better times. Buyers wait for the decline which they believe must come. This waiting causes dullness and even idleness at the mills. These high prices, if the goods are sold, tend to keep up the high cost of living; failure to sell the goods decreases the employee's power to buy the necessaries of life. We refer to the combinations that control the output and the prices of steel rails, nails, structural steel, plates, rods, wire and some other products. It is folly to insist upon these prices now. A reduction of them cannot long be deferred.

Such prices, in other industries as well as in the one of which we have been speaking, served in times of greater business activity to provide dividends upon inflated capital. They were sustained by agreements, by the tariff, by an extraordinary consumptive demand, and in part, eventually, by increases of wages. Some who assisted in determining what they should be and in maintaining them, foresaw that they could not forever be easily obtained. These gentlemen took their profits and withdrew. One of them, prominent in the steel industry at Pittsburg, voted less than two years ago at a stockholders' meeting upon 50,000 shares of Steel Corporation preferred and 35,000 shares of the common stock, then having a market value of nearly $6,000,000. He died a few months ago, and the inventory of his estate now shows that at the time of his death he held only 300 shares, valued at $16,500. We presume that if the securities owned by other persons still living, who formerly held large quantities of Steel Corporation stock, should be examined for the edification of the public, evidence of similar foresight would be disclosed. But the control of this company, and the control of others, is still vested in officers who prefer high prices that are out of date, with dwindling busi-

ness, to prices in harmony with the times, accompanied by a brisk revival of demand.

We do not undertake at this time to consider all the causes of the greatly increased cost of living. But we believe it is true that the arbitrary advances made and sustained in certain manufacturing industries have tended to increase prices in other fields of production by direct connection, by the force of example, and by means of higher wages that have increased the employee's power to buy without encouraging him to be economical in his expenditures.

Partly by reason of this increase of wages (which has not, as a rule, been granted voluntarily by employers and upon their initiative), those who have sought to make prices high are now in a disagreeable situation, from a political point of view. If they insist upon maintaining the high prices that were based upon a suppression of competition at home and a prevention of competition from abroad, they must submit to a restriction of output that will deprive a considerable number of employees of work, thus exciting their hostility, and must expect to be held responsible in some measure for the high cost of living. On the other hand, if they adjust their prices to the present condition of the market, yielding to the law of supply and demand, they can scarcely expect to do business profitably without cutting down the cost of production by reducing wages. Either course, so far as organized labor is concerned, offers some advantage to the Opposition in politics.

Hebrew Charities

In the coming week there will be held in this city the Biennial Conference of Jewish Charities. The occasion calls to mind the fact that Hebrews take care of their own sick and poor, without burdening the public.

There are about 600,000 Jews in Greater New York; of these, a pretty fair statement is that not more than 10,000 are well to do; one-half of these are rich, and out of these a few thousand are very wealthy; less than a hundred, at a rough estimate, are millionaires. The balance may be divided into two classes—those who have a competence with small industries of their own, and those who are engaged in fairly well paying employment. The vast majority of the rest live within the limits of what is known as the "Ghetto," or East Side of the city, between the Bowery and the East River.

In this "Ghetto" dwell the Russian and Rumanian immigrants, driven here by oppression. The immigrants come without knowledge of our countary, language, or material conditions—half of them old people and half young children. From an American standpoint, altho most of them can read and write, they are not much more than half civilized. These 10,000 Hebrews, therefore, are perpetually confronted with the task of civilizing and Americanizing these arrivals, of educating their children and fitting them for citizenship and of supporting this immigrant community during the process of evolution.

This gigantic task is cheerfully undertaken by this upper 10,000. Some impression of the magnitude of the work will be gained by mentioning some of the institutions organized, maintained and entirely conducted by this body of our citizens.

Churches are not exactly charity organizations; but churches they must have, and there are about 425 temples and synagogs in Greater New York, and nearly all of these carry on regularly organized charity work. The two large temples on Fifth Avenue, and the other half dozen or so not much inferior in size on other avenues, do this on a large scale. The smaller synagogs all have benevolent institutions connected with them, termed *Chevras*, which are mutual benefit societies, providing for the poorer members in sickness, paying funeral expenses at death, and giving more or less important pensions to the widows. The large temples and synagogs have sisterhods, on the plan of the King's Daughters, connected with them. They are divided into districts like parishes, and look after the poor of that neighborhood, providing food, clothing and employment, looking after the sick, maintaining kindergartens, sewing schools, mothers' meetings, and giving entertainments for the benefit of the poor

mothers and children of their neighborhoods.

But this is only incidental. The Hebrews have just finished a three million dollar hospital (the Mt. Sinai), with their own money, and supported entirely by themselves, altho free to all denominations and races. With this hospital is one of the best equipped training schools for nurses. They have two other new and large hospitals in this city, the Beth Israel, downtown, and the Lebanon, uptown; a hospital for consumptives at Bedford Station, New York; and they pay large sums toward the maintenance of the Hebrew National Home for Consumptives, at Denver. They maintain a lying-in hospital and an infant asylum; the Montefiore Home for Incurables, a large building in 138th Street; a magnificent orphan asylum; the Sanitarium for Hebrew Children, at Rockaway Park, which also gives tri-weekly outings for mothers and children all through the summer; also a home for aged and infirm Hebrews in this City of New York, and another at Yonkers.

But we have no room for the whole list. We can only mention the Young Men's Hebrew Association, with a fine modern building, the gift of Jacob H. Schiff; a theological seminary, a new granite building (also the gift of Mr. Schiff), but maintained by the Hebrews, with a large corps of professors; two free libraries, the Aguilar and the Maimonides; the Baron de Hirsch Home and Schools for girls, where they are taught cooking and technical arts, and the Baron de Hirsch School for Boys, and dozens of technical and other schools.

The three largest and most important of their institutions are yet to be mentioned. There is the great building of the United Hebrew Charities, a white granite structure, the gift of the late Solomon Loeb. This organization undertakes to do the charitable work of the entire community on a large scale, and all smaller associations that are here named or not named are affiliated more or less with it. They provide for the immigrant, for the sick, give clothes and food and money to the poor, find employment for them and secure transportation all over the country for those in search or need of work. They have a complete and thorough system of investigation, and it is through the United Hebrew Charities, with an able sociologist at its head, that the well to do Hebrews of New York in a systematic manner take care of their poor.

Then there is the monster Educational Alliance, which is a whole educational and philanthropic institution and system in itself. It includes kindergartens, schools for the study of Hebrew, sewing schools, music classes, club rooms, an auditorium for large assemblages, a free synagog, a gymnasium, a roof garden, lecture courses, cooking classes, dressmaking and millinery classes, classes for technical and applied arts, a good library, a reading room, an information bureau, religious schools, a dancing hall, a social room, an employment bureau. Besides all these opportunities and benefactions, the Alliance provides almost nightly and on Sundays entertainments of all kinds and description, concerts, readings, tableaux, and provides for the appearance of distinguished speakers and lecturers, native and foreign.

Lastly, there is the great B'nai B'rith Order, which, besides looking after the needs of its members, providing for them in sickness and pensioning widows and caring for orphans of deceased brothers, has set itself the task of looking after the interests of Hebrews unfortunately situated all over the world. In the recent unfortunate Kishenef massacre it was the B'nai B'rith that undertook to speak for the Hebrews of the United States to the President and Secretary of State, with a view to the amelioration of the condition of Hebrews in Russia.

The foregoing catalog seems rather a large one in proportion to the numbers and even to the wealth of the Hebrews of New York; for whatever public opinion may hold, the truth is that, with possibly one or two exceptions, they have no multi-millionaires on anything like the scale to be found among the rest of the community. All this immense charitable and educational work of the Hebrews is carried on outside of the public view by a people not of extraordinarily great wealth, but

who do it cheerfully, gladly, esteeming it only their right and privilege, and call it nothing but "The Fulfilling of the Law."

Henry M. Stanley

The most sensational life of our generation was ended in the death of Henry M. Stanley. Born an American in the humblest circumstances, he became a member of the English Parliament. An impecunious reporter, he achieved wealth and international fame. He was the most remarkable explorer of the century, and left his name forever on the map of Africa, which he penetrated and traversed again and again, both for adventure in finding Livingstone, and then bringing back his body, and in rescuing Emin Bey against his will. The man who revealed the Kongo River and the great lakes to the civilized world, and really created the Kongo Free State, in his tremendous marches displayed such heroism and unconquerable will as the history of exploration has nowhere else recounted. He was vain and sensitive to criticism, and he just escaped that degree of eminence in character which would have secured his body burial in Westminster Abbey. A monument there must suffice.

The Foreign Policy of Republics

A principal charge brought against republics has been that they cannot hold a strong, consistent foreign policy. It is time that myth should die, for the United States and France are conclusive evidence to the contrary. From the day that Napoleon III made way for the French Republic a strong and steady policy has developed, which has resulted in creating a vast imperial Power, possessing colonies covering almost half of Africa and a rich and enlarging sphere in Asia. For the past fifteen years, as those most prejudiced against a republic must admit, no European monarch has had a policy more constant and tenacious than that of France. The alliance of France with Russia when it was most needed has been followed, at the right time, by an understanding with both England and Italy which not only assures peace, but controls international affairs. Equally our American foreign policy has remained unchanged, supported by the people through all administrations, ever since the Monroe Doctrine was proclaimed, and it has controlled this continent; and Europe has discovered, since our war with Spain and our part in securing an open door in China, following our influence in the developing of Japan, that we are a world Power of the first rank, always to be considered. It will finally be found that a republic, whether after the English or the American pattern, is the best form of government for foreign as well as domestic affairs.

Pictures for the Poor

The other day the University Settlement of this city opened its doors to the people of the East Side for a free loan exhibition of paintings. During the fourteen days of the exhibition 25,000 visitors came to see the pictures, an attendance which shows that the poor will gladly patronize such an exhibition if it is held in their neighborhood. The preponderance of children over grown people was a marked feature of the attendance, reversing the usual rule in most art galleries. Mr. Hamilton, the Head Worker of the Settlement, in summing up the results of the exhibition, declares that the pictures of the nude should be excluded in the future, as their allegorical meaning is not understood, also that pictures without life or the suggestion of life, especially landscapes or marines, seem to awaken no interest. Children seem to demand life in pictures, groups representing humorous or homely scenes, such as "The Village Musicians," the "Blacksmith Shop" or "Babyhood." It is a sad commentary on city life that city children cannot respond to representations of nature and that landscapes and water views awaken no sympathetic emotions. Another settlement in New York has recently adopted an idea for getting pictures into the homes of the people, which has proved popular beyond expectation. Each child is given a picture frame, and then allowed to select from a large stock a picture to put in it. This is taken home and kept for a week, when it is returned and another picture substituted. This circulating picture scheme has proved to be as popular with the parents as with the chil-

dren, and it is so simple that it can be adopted everywhere with very little trouble or expense.

Teaching History in the South

It is not our language, it is the indictment drawn against his own section by one to the manor born, which we quote from William E. Dodd, Professor of History in Randolph-Macon College, in Virginia. He is discussing the difficulties which a teacher of History meets with in the South. He tells us that teachers are very few. In Virginia, North Carolina and South Carolina only two men give their entire time to teaching History. The youth that come to college have almost no knowledge of history. Half of an incoming class, Virginians at that, did not know who John Marshall was. But another difficulty which the teacher meets is thus described:

"In the South, and particularly in the older sections of it, public opinion is so thoroughly fixed that many subjects which come every day into the mind of the historian may not with safety even so much as be discussed. To suggest that the revolt from the Union in 1860 was not justified, was not led by the most lofty-minded of statesmen, is to invite not only criticism, but an enforced resignation. According to Southern public opinion, the whole race question is finally settled never to be opened again, and in matters further removed from the field of politics, such as literature and art, it is extremely dangerous to give voice to adverse criticism of the South's attainments in the past or of her present status. . . . To speak out boldly means in many instances to destroy one's power of usefulness. . . .

"To make conditions worst, our grand Confederate camps fear that what they call 'false history' may be smuggled in from the North, and have history committees, with representatives in every Congressional district, whose business is to keep watch and put out of the schools any and all books which do not come up to their standard of local patriotism. . . . I have seen the very best books we have in American history ruled out of the South by these committees . . . and as a rule the very poorest books to be found anywhere are the favored ones on our *index expurgatorius*. The Confederate veteran works almost as great havoc in the field of history, tho he unquestionably does some good, as does the Union veteran in the neighborhood of the United States Treasury."

This needs no comment; it only requires recognition that the academic freedom may be demanded and recovered. The *South Atlantic Quarterly*, from which we quote these words, is doing much for this cause.

Religious Liberty in Europe

Extremely curious and interesting is the contract just read between France and Germany in their treatment of the Roman Catholic Church. Catholic France, eldest daughter of the Church, is driving the religious orders out of the country as relentlessly as the Philippines expelled the Spanish friars, and forbids them to carry on their schools. The President of this Catholic Republic goes to Rome and cannot pay a visit of ceremony to the Pope. But the Emperor of Germany, when he goes to visit the King of Italy, pays a visit of extremely courtesy to the Pope, and is most politely received. He goes back to Berlin and one by one has the Falk laws against the Catholic Church repealed, until now there is nothing left of them. The Jesuits are welcomed back, and the Emperor William quite enjoys his trip to Canossa. So now the three happiest countries for the Catholic religion, the three where it has the greatest liberty, are Germany, Great Britain and the United States, three predominantly Protestant countries, while the three countries in which the Catholic Church feels itself the most under unwelcome restraint are Italy, France and Spain, three Catholic countries. Here is a chance for students of freedom of religious thought to draw a lesson.

The Young Men's Christian Association at Hartford Seminary has been collecting religious statistics of our colleges. In 26 colleges under general Congregational control it records 982 members of the senior class, of whom nearly 600 are communicants and about 50 intend to enter the ministry, 5 each coming from Amherst, Colorado and Yale. Of the other institutions very few count less than half the seniors as communicants. Lehigh having 40 out of 90 seniors, Rutgers 15 out of 46, University of Pennsylvania, 300 out of 680, and University of California, 90 out of 225. The

colleges whose senior classes promise to supply the most ministers are Gettysburg, 15; Princeton, 11; University of Pennsylvania, Wesleyan, and Ohio Wesleyan, 10 each; Dickinson, 9; Boston, Brown, Lafayette, Lincoln (Pa.) and De Pauw, 8 each. The prospect is not unhopeful.

Massachusetts, by the last census, has 2,805,346 inhabitants; Louisiana nearly half as many, 1,381,625. Massachusetts had 53,695 illiterates, mostly immigrants; Louisiana, 122,638, mostly natives. The Massachusetts law forbids the ballot to all its illiterates; Louisiana allows illiterates to vote whose ancestors possessed the right of suffrage before the Civil War. At the last election for Governor Massachusetts cast 396,479 votes; Louisiana cast about 38,000. But in Louisiana the main voting is done in the Democratic primaries. In New Orleans 31,379 registered, of whom 617 were colored, but only 18,142 votes were returned as cast at the election. The object of the Massachusetts system is to bring out the full vote; that of the Louisiana system is to centralize the power in the hands of a limited electorate.

The Marconi Wireless Telegraph Company expects within a few days to begin commercial business between England and America. For months its offices on the two sides of the ocean have been holding communication without difficulty. They are never disturbed by broken cables or storms, for the intervening ether is permanently continuous. Only such an electrical storm as produces auroras can interfere, as it does also with the telegraph. A more startling design of the company is to open communication between Italy and Argentina, across seven thousand miles, which Marconi expects fully to accomplish.

The extraordinary thing about the late report of the general massacre of Armenians in the Sassoon region is that it indicates a fight in which seven hundred Turks were killed as well as nine hundred Armenians. Can it be true? The Turks claim that they were suppressing a rebellion, and we hear reports of several thousand armed Armenians, who have been preparing for resistance since the massacres of 1896. They have found Russia a hard foster-mother, and it may be that now, as the report goes, they are nearly wiped out. Will not France and England intervene, now that Russia is out of the way?

We have thought well of Dr. Cranfill, editor of the most widely circulated Baptist paper in the United States, but his drawing a pistol on the cars upon a rival Baptist editor quite forbids apology. Why should a Texan minister carry an illegal pistol? Why should such passions disturb celestial minds? This outbreak seems the more unaccountable as Dr. Cranfill has been for several years under the soothing and restraining influence which envelops one who is an occasional correspondent of THE INDEPENDENT.

It is good news that the American Bible Society, following the lead of the British Society, consents to publish the Revised Version, after these many years. Two years ago the Society's Version Committee unanimously recommended the publication, after correspondence with biblical scholars in the country. Already the Revised Version is read from a multitude of pulpits in place of the Old, and the people are familiar with it in the responsive reading of the Psalms, so that the decision of the Bible Society will have general approval.

The present Pope appears to be very positive in matters of worship. He not only insists on the Gregorian chant, but has issued a new *motu proprio* requiring that only the music shall be used in the mass which he will have published, and which will exclude women. This is a very disagreeable limitation of liberty in worship and will hardly please the American archbishops, as it appears to anticipate their humble request that he modify his directions in favor of their conditions. It appears very unwise thus to disturb the peace of the congregations.

Mayor Collins rules Boston, and Boston will not entertain the Filipino Commissioners.

Insurance

The Fine Art of "Twisting"

In a recent issue the evils of rebating were treated in this department and reference was made to its twin, known in the life insurance business under the name of "twisting." A peculiar, and by no means desirable, order of talent is required in a life insurance agent to render him an expert at this trick. On general principles, he must have the destructive faculty largely developed; he must be absolutely devoid of conscientious scruple; he must have brought the art of plausibility to a state of perfection and shun truth as only becomes a faithful disciple of the father of lies. It is wonderful how many of them there are who can measure fully up to this standard, altho they do not constitute a majority of the companies' representatives.

It may be necessary to explain to some readers what "twisting" is, the term being one peculiar to the life insurance business and ranking in grade, tho not in meaning, with such slang words as "tout," "bilk" and the like. It carries with it the idea of something disreputable. The person who practices the art is known as a "twister"—an agent who can write life insurance only by making a policyholder dissatisfied with a policy he is at present carrying. He substitutes for it one in the company he represents, or, rather, misrepresents. In order to succeed, he must deceive the policyholder and induce him to sacrifice all or a part of the equities he has in the policy attacked. Marvelous shrewdness, allied with conversational and mathematical accomplishments of a high order, are required to thus overcome and put to sleep another man's good sense.

Having once secured a risk measuring up to all the physical and moral standards fixed by it, a company does everything in its power to retain that risk on its books; and many companies, in order more effectually to discourage withdrawals, penalize them by retaining a proportion of the reserve. The withdrawal of healthy members has the effect of putting "the selection against the company"—that is to say, lowers the general grade of the risks. The withdrawal charge is made to neutralize this. The policyholder who is "twisted" generally suffers this loss. Again he is older—one year, five years, in some cases twelve or fifteen years, proportioned to his susceptibility to "guff." His annual premiums are consequently higher. Another very serious disadvantage consists in the time that has been lost; the maturity of the policy, if it is written for a fixed term of years, either as to paid-up insurance or as to distribution of dividends, is deferred to a later and perhaps less productive period of life.

In short, there is not a single sound reason why a man holding a policy in any solvent company, fairly managed, should give it up to take one, either in another or even in the same company, and there are many good, substantial reasons why he should keep it. The only safe way, then, is to refuse bluntly to entertain the propositions of a "twister," and, as soon thereafter as possible, to communicate the attempt he has made to the home office of the company in which you are insured. There is no law forbidding "twisting"; policyholders must protect themselves against its seductions.

Sanitary Sleeping Cars

A new type of sleeping cars is being designed for the Pullman Company. These are to be taken as a standard for designs for similar cars to be made in the future, embodying as they will modern sanitary requirements that are calculated to reduce to a minimum the harboring of germs and other forms of bacteria, as well as dust and mold. The changes introduced are largely in the use of the "sanitary curve" instead of corners, grill work and other fancy decoration with which Pullman cars now abound. All the wood work in the new cars will be inlaid and the surfaces will be finished smooth. Marquetry work will have a prominent place. Mohair draperies will replace the heavier varieties hitherto used and upholstery will be only sparingly used. New and exceedingly stringent rules have been adopted by the company regarding the fumigation of cars in which sick persons are known to have ridden.

Financial

Growing Trade with Cuba

THERE has been a remarkable increase of trade between the United States and Cuba since the new treaty of reciprocity went into effect, on December 27th. Official reports for the first three months of the present year, these being the first three months of the treaty rates, show that our imports from the island have almost doubled, while our exports to Cuba have increased by nearly 25 per cent.:

IMPORTS FROM CUBA.

	1903.	1904.
January	$2,557,055	$5,287,440
February	4,013,453	7,711,704
March	5,378,089	10,218,036
Three months	$11,948,597	$23,217,180

EXPORTS TO CUBA.

January	$1,870,619	$2,093,606
February	1,535,978	2,152,328
March	1,804,466	2,249,215
Three months	$5,211,063	$6,495,149

Here is an increase of 94 1-3 per cent. in imports and 24 2-3 per cent. in exports. Of the quarter's imports, 83 per cent. was sugar. The increase of exports is shown with respect to a large variety of products, notably in the case of wheat flour. Lumber, furniture, agricultural implements, cotton cloth, sewing machines, locomotives, and leather are also prominent in the list.

While this reciprocal agreement is beneficial to both countries, the growth of our export trade with Cuba must follow and be stimulated by the increase of imports; for Cuba's sales to us increase her power to buy. Enriched by profitable sales of her products in our markets, the island will become a large buyer of American provisions and manufactured goods. In all probability the increase of our exports to Cuba hereafter will be much more than 25 per cent.

GROSS earnings of 68 railroad companies in April show a decrease of 4½ per cent.

....Gross postal receipts for April at the fifty leading offices in the country exceeded those of April, 1903, by 8 per cent.

....Deposits in the savings banks of Massachusetts have grown from $218,000,000 in 1880 to $540,000,000 in 1900, and $608,000,000 in 1903.

....Export shipments of gold and engagements for shipment since April 8th and up to the end of last week amounted to $52,475,000.

....The General Electric Company has decided to increase its capital stock by $3,325,500, making the total $48,325,500.

....Beerbohm's estimate of Argentina's surplus of wheat for export, in the present season, has been 92,000,000 bushels, against 66,000,000 exported last year. Other recent estimates range between 72,000,000 and 80,000,000 bushels.

....The Lake Shore's annual report shows that the company's holdings of securities have been increased by nearly $33,000,000. Among the shares acquired are 685,000 of Reading, 50,000 of Lehigh Valley, and 40,000 of Pittsburg & Lake Erie.

....Dun's index number for May 1st shows that at no time since the beginning of the boom, one year excepted, has the cost of living at this season been so high as it is now. The rise from the low point of 1897 has been more than 40 per cent.

....The Wabash Railroad (of the Gould system), which overcame many obstacles in entering Pittsburg, will now enter the great iron and steel districts of the Mahoning and Shenango valleys by constructing a new line and by purchasing the right of way of the Lake Erie, Youngstown & Southern Company.

....The late Alfrederick S. Hatch, who died on the 13th inst., at the age of 75, was for many years very prominent in the financial world as a member of the well-known firm of Fisk & Hatch, which successfully floated a great loan for the Government at a critical time in the Civil War. We recall his intimate business relations with THE INDEPENDENT during the years of his activity. In 1883 he was elected President of the Stock Exchange and for two terms he held this office.

....Dividends announced:

Amer. Chicle Co., Common, 1 per cent., payable May 25th.

Amer. Cotton Oil Co., Preferred, 3 per cent., payable June 1st.

The Independent

Vol. LVI NEW YORK, THURSDAY, MAY 26, 1904 No. 2895

Survey of the World

In the Field of Politics

A lack of enthusiastic support for Judge Parker was noticeable last week in several States to which his friends have been looking for a ratification of the choice made by the Democrats of New York. The cause of this lukewarmness is said to be the unsatisfactory character of the New York platform, the prominence of ex-Senator Hill in connection with Judge Parker's candidacy and the factional conflict in New York City between Mr. Hill's friends and Tammany. At the same time there was observed a renewal of the movement in favor of Mr. Cleveland, especially in Indiana. Altho instructions for Parker were given in that State by a vote of almost two to one, the anti-Bryan leaders there, some of whom voted for such instructions, are now saying to the press that the party ought to nominate Cleveland. This is the opinon of Mr. Keach, chairman of the Democratic Committee in Indianapolis, who remarks that no other candidate can win. Altho a majority of those who are talking in this way were Gold Democrats in 1896 and 1900, similar views are expressed by Edgar A. Perkins, president of the Indiana Federation of Labor. There is as yet no evidence that Mr. Cleveland has given them any encouragement. At the end of last week 132 delegates had been instructed for Judge Parker, and a little more than 100 for Mr. Hearst, whose friends controlled the convention in his native State, California, by only a narrow margin, having been outvoted at the beginning, in the election of a temporary chairman. In New York, the three Democrats on the electoral ticket who are connected with national banks—John T. Woodward, Harry Payne Whitney and Isidor Straus—have resigned, a committee of prominent lawyers to whom the question was referred having reported there was room for doubt as to their eligibility. Objection to Mr. Woodward had been made by a prominent Democratic journal because of his association with Mr. Morgan in connection with the bond issues in Mr. Cleveland's second term.—Mr. Parker, chairman of the Populist party's Executive Committee, says that Mr. Hearst, if nominated by the Democrats, would have the support of the Populists, who would put up no ticket of their own. "His views and principles," Mr. Parker adds, "agree with ours."—It is now understood that the new chairman of the Republican National Committee will be George B. Cortelyou, now Secretary of Commerce and Labor, who will resign his Cabinet office after his election, at the time of the national convention, and who may return to the Cabinet next year, as Postmaster-General, if Mr. Roosevelt is elected. Mr. Cortelyou has not been a politician, but his duties and associations have given him wide acquaintance with men in public life and a thorough knowledge of the political situation. Fifteen years ago he was a teacher. In 1891 he became the private secretary of the Fourth Assistant Postmaster-General. Transferred to the White House, he served as President Cleveland's confidential stenographer. On the retirement of the late John Addison

Porter he was appointed secretary to the President by Mr. McKinley, and this office he retained under Mr. Roosevelt until he entered the Cabinet. Until about ten years ago he was a Democrat. Cornelius N. Bliss will be treasurer of the committee.—Altho it was expected at the adjournment of Congress that representatives of the Senate Committee on Elections would go to Utah, a few weeks later, and that the inquiry concerning Senator Smoot and the Mormons would be continued there, it is now announced that the inquiry will not be resumed until after the Presidential election. In a recent speech, Senator Smoot said that Mr. Roosevelt would probably fail to carry New York, owing to the opposition of the money power, but that he would be elected easily without New York, and would carry Utah by at least 10,000.

State Conventions and Quarrels

The situation in Wisconsin is regarded with some anxiety by the Republican leaders. In the Republican convention, on the 18th, the opponents of Governor La Follette (who was a candidate for renomination) left the hall and organized another convention. They had claimed a majority of the delegates, but there were contests involving more than 80 seats, and these contests were decided in such a way by the committee that a majority of about 80 for the Governor was disclosed on a test vote. Whereupon the opponents of the Governor withdrew. The original convention, in which 585 delegates remained, renominated the Governor and placed him at the head of the delegation to the national convention. The other convention (of 567 delegates) nominated Ex-Congressman S. A. Cook. Three of its delegates-at-large are Senator Spooner, Senator Quarles and Congressman Babcock. The two Senators attended this second convention and spoke in support of it. There seems to be no hope of compromise, each faction asserting its determination to fight to the bitter end. Both stand for Roosevelt and have nominated the same electors, but the State law may prevent a profitable use of this agreement. The contest will be taken to the courts and must come before the Republican National Committee. The State may be carried for Roosevelt, but the next Governor will probably be a Democrat. The original convention's platform commends Mr. Roosevelt's action at the time of the coal strike and his prosecution of the railroad merger. It calls for legislation to increase the power of the Interstate Commerce Commission, and speaks of the tariff as follows:

> "We firmly adhere to the fundamental Republican doctrine of protection to American labor, and believe that the aim of a truly protective policy should be to stimulate competition in the home market and not to destroy it by favoring Trust combinations. We therefore believe in a readjustment of tariff schedules in all cases where protection is employed for the benefit of capital only, to the injury of the consumer and workingman."

In Iowa the Republican convention was controlled by those who oppose the tariff views of Governor Cummins. All propositions looking to revision were rejected. The Governor was made a delegate-at-large, and he said he would stand on the platform.—After several days of fruitless balloting for a nominee for Governor, the Illinois Republican convention adjourned for ten days.—The New Hampshire Republican platform opposes "reciprocal trade relations that involve an exchange of competing commodities." In several other Republican conventions reciprocity in any except the non-competing products has been disapproved.—Mr. Hearst's friends were defeated in the election of a temporary chairman at the California convention by a vote of 367 to 345, but afterward the views of some delegates were changed, and the vote for Hearst instructions was 365 to 346.—In South Carolina the Democrats declined to give instructions for Parker. In North Carolina no negroes attended the Republican convention. Two great parties of the same race were needed at the South, the chairman said.

Our Relations with Cuba

The second anniversary of Cuban independence was celebrated on the 20th inst. in Havana by parades, reviews, mass meetings and fireworks. In New York, ex-Secretary Root presided at a banquet. Among those present, in addition to the Cubans residing in the city, were Senator Platt, of Con-

necticut; Sir William Van Horne, and General Corbin. In a letter which Mr. Root read, President Roosevelt reviewed briefly our relations with Cuba since the beginning of the recent war, and then spoke as follows concerning the attitude of the United States toward "our Southern neighbors:"

"I hail what has been done in Cuba, not merely for its own sake, but as showing the purpose and desire of this nation toward all the nations south of us. It is not true that the United States has any land hunger, or entertains any projects as regards other nations, save such as are for their welfare.

"All that we desire is to see all neighboring countries stable, orderly and prosperous. Any country whose people conduct themselves well can count upon our hearty friendliness. If a nation shows that it knows how to act with decency in industrial and political matters; if it keeps order and pays its obligations, then it need fear no interference from the United States. Brutal wrong doing, or an impotence which results in a general loosening of the ties of civilized society, may finally require intervention by some civilized nation, and in the Western Hemisphere the United States cannot ignore this duty; but it remains true that our interests, and those of our Southern neighbors, are in reality identical. All that we ask is that they shall govern themselves well, and be prosperous and orderly. Where this is the case, they will find only helpfulness from us.

"To-night you are gathered together to greet a young nation which has shown hitherto just these needed qualities; and I congratulate not only Cuba, but also the United States, upon the showing which Cuba has made."

In his address, Mr. Root said that he was glad to bear personal testimony to the admirable conduct of the Cuban people, their respect for law, their love of country, and their subordination of personal interests to the larger welfare of their land. Turning to the political and other relations of the two countries, he continued:

"So far as military relations are concerned, Cuba must always be an outpost of attack or defense for the United States. If Cuba has a friendly population inspired by friendship and gratitude for us she will stand guarding our coasts and the pathway to the Isthmus for all time. But with Cuba unfriendly and her people resentful she will be willing to harbor the armies and navies of the world as a menace to the United States, and this country will be forever robbed of the isolation and command of its coasts. For Cuba's own protection against hostile nations the United States must treat her as being within the line of defense of all the Americas.

"The recent discussion of the treaty of reciprocity proceeded largely on questions of commercial advantage, but beneath all that is involved the much greater policy of the future. There is the larger and broader view which includes the future when the canal shall be the pathway of the commerce of the world and when the relations between this country and Cuba will be of vital concern to all the world."

General Weyler has sent to General Maximo Gomez, the old insurgent leader, a diary found upon the body of the latter's son Francisco, who was killed in company with General Maceo during the war.

The Western Union's Racing Service

Owing to the action of the Western Union Telegraph Company and Police Commissioner McAdoo, gambling or betting upon horse races in places called pool-rooms has become quite difficult and inconvenient in New York. The new policy of the telegraph company also makes it difficult in other cities. On the 13th inst. the Western Union's Executive Committee, by resolutions, expressed approval of President Clowry's offer to Mr. McAdoo that he would withdraw racing service from places where the news was unlawfully used if he would specify them. This action did not satisfy the Police Department, and it became known three days later that the District Attorney was preparing to ask for a consideration of the company's racing service by the Grand Jury. On the 17th President Clowry ordered that the direct racing service of the company to subscribers in New York City be discontinued. But the racing news collected by the company was still sent to other cities, from which it was promptly transmitted to the New York betting rooms. That day the police raids began. An exchange from which racing news was distributed was entered; 11 telegraphers, 21 telegraph instruments and 17 telephones were captured. On the 18th the Western Union decided to go out of the racing and pool-room business. President Clowry abolished its racing bureau. Orders were sent South and West announcing that the company had "decided to discontinue forthwith the collection and distribution of race horse reports." This action was prompt-

ly approved by the Executive Committee, and was regarded by District Attorney Jerome as the highest evidence of the company's good faith. The directors, he remarked, had met the issue honorably. Pool-rooms then began to rely mainly upon telephone communication from race tracks and other places. The local telephone company offered to assist the authorities, asserting that it had made no special arrangements for serving the betting rooms. On the 20th Commissioner McAdoo ordered a general attack upon the lawbreakers. Fifteen pool-rooms and seven exchanges (from which more than a hundred pool-rooms obtained their news) were raided; 70 prisoners were taken and more than 150 telegraph or telephone instruments confiscated. One large exchange was found in a room on the roof of a "sky-scraper" near the Stock Exchange. On the following day 200 pool-rooms found it impossible to carry on their business. Assisted by the telegraph and telephone companies, the Police Commissioner and the District Attorney hope to close all of them. The action of the telegraph company is generally regarded as having been taken in response to the extraordinary pressure of public opinion.

Labor Controversies

The strike of the masters and pilots employed on lake boats has tied up nearly three-quarters of the lake shipping and deprived more than 100,000 men of work. Manufacturing interests are beginning to be seriously affected by the suspension of lake traffic. Owners of ship property valued at $60,000,000 have decided to make no concessions. The masters and pilots demanded higher wages, which the owners declined to give, saying that the condition of business did not warrant any increase. An interesting question is raised by the fact that the masters and pilots do business upon Government licenses, and that their places can be filled only by persons to whom similar licenses have been issued. If the vessel owners prefer charges against holders of licenses who refuse to accept employment, the Government's steam vessel inspection service may revoke licenses if proper and reasonable grounds for the refusal are not given.—Several member of the Marine Band having accepted employment in the orchestra of a Washington theater where vacancies had been made by a wage controversy, Mr. Roosevelt has given orders forbidding any member of the band to take the place of a civilian musician locked out or on strike. The order will probably be applied to military bands at the several posts.—Traffic by water between New York and Southern New England ports has been seriously affected by a strike of the freight handlers employed on the New York piers of the Fall River, Providence and other Sound lines, followed by strikes of employees of the same class at other terminals. It is admitted that the cause of the original strike was the refusal of the controlling company to discharge a faithful assistant foreman at the demand of the union, of which he was not a member. Several days after the beginning of the strike there was added a demand for higher wages. At the beginning of the present week there were indications that 5,000 men at the several terminals would be called out, and that the strike might spread to lines doing business between New York and Southern ports.—The Pennsylvania Railroad Company will reduce the number of its employees east of Pittsburg by 11,000 men, owing to a decrease of business. Similar reductions have been made by other railroads having terminals at Chicago. It is estimated in that city that the working force of all the railroads has been reduced by 50,000 men during the last six months.

Polish Discontent

The Russians in Poland hate the Poles now more than ever, for, notwithstanding all their efforts to excite "patriotism" in the Poles, the Polish community stands—with the exception of the handful of "conciliationists"—a united whole, cold and indifferent in the face of the apostles of Russophilism. A circular issued by the Poles of Warsaw to the effect that they would brook no manifestations of loyalty and that they would cudgel those who would participate in such manifestations produced the desired effect at once. The police abandoned the projected loyalist parade. About a thousand Poles then marched through the streets singing revolutionary songs and uttering shouts for the independence of Poland.

An adjunct of the police, who asked the throng to disperse "in the name of the Czar," was killed. Nor is there heard much about contributions from the Poles for the Russian Red Cross and other military needs of Russia. The Polish peasantry, which in the course of two months contributed 200,000 roubles for the statue of Adam Mickiewicz, Poland's greatest poet, has now contributed voluntarily at the most 200 roubles for Russia's war with Japan. Even the Polish magnates are in no haste with their contributions. A few weeks ago the Polish students and workingmen of Warsaw made demonstrations before the English and French consulates to indicate their sympathy with Japan and their hatred to Russia. In other Polish cities also there have been hostile demonstrations against the Russians, as in the University of Dorpat, and in Vilno, where the Polish youths attempted to blow up the statue of Muravieff, who, for his cruelty and bloodthirstiness in the revolt of 1863, when he was Governor-General of Lithuania, gained the appellation of "The Hangman of Lithuania."—It is undeniably true that the Russo-Japanese War, or, rather, the Russian reverses, have given the Polish patriots new hopes. The Russian Government evidently does not make light of the situation in Poland, for a few weeks ago it issued an order to the local officials to be on their guard, and it increased the police force in all Russian Poland, even pressing into that service the janitors of private houses. The authorities in Warsaw have developed a desperate activity in espionage of every one and everything Polish. All the Polish newspaper offices are beset with spies, and all the prominent and influential Poles are being dogged. The fact that the guard on the frontier, which was already extreme, has been increased is a proof that the authorities fear that from abroad there will come in not only uncensored news from the seat of war, but also revolutionary addresses.—Wholesale arrests in Russian Poland are now more frequent than ever. On May 3d, the anniversary of the promulgation of the Polish Constitution of May 3d, 1791, 200 Poles were arrested on the streets of Warsaw, one student being killed. About 400 persons, mostly workingmen, were arrested in Lodz in one day. The police informed the prisoners that they are suspected of Socialism, that they will be punished and probably sent to Siberia, but that they may escape all punishment if they enlist as volunteers in the army going to the seat of war. Governor-General Chertkoff, of Russian Poland, went to St. Petersburg to report the growing discontent among the Poles. He declares that altho the political programs of the four Polish parties—the National League, the Democratic Party, the Polish Socialist Party, and the "conciliationists"—differ, all endeavor to regain freedom for Poland, and, at the moment of a struggle, twenty millions of Poles will enter the ranks. Chertkoff declares that the revolutionary movement in all Poland is increasing with each day, and may break out at any opportunity.—According to the most reliable Polish authorities, however, there are at present neither revolutionary movements nor any preparations for a revolt in Poland. The Central Committee of the National League admonishes the Polish community in Russian Poland against all unreasonable acts, which, while they would not greatly hamper the Russian Government in its military action, would introduce only disorganization in the ranks of the Poles themselves. The present war, whether Russia will be victorious or beaten, says the address, must hasten the internal crisis in the Russian Empire, and bring nearer the moment of the reconstruction of the political constitution of the Russian State; while the period of grievous struggles opening for Russia in the East, if she wishes to maintain her prestige there, will constrain her to a change of policy with respect to the nations oppressed by her, particularly with respect to the Polish nation. The Government, indeed, has given up hope of obtaining voluntary contributions from individual Poles, and Governor-General Chertkoff has issued a secret order to the Governors under him to direct the cities to pay a war tax. Warsaw, for example, is to pay 100,000 roubles; other cities, a few thousand or a few hundred, "in the measure of their power and means," as the Russian papers express it. But overzealous officials have not tired of extorting "voluntary" contributions from individual Poles. In this work they apply not only to persons di-

rectly dependent, but also to other persons who, they judge, will not dare refuse. Pressure is being used by judges on the lawyers to have them collect contributions for Russia's military needs. Like means are used on the physicians by the medical inspectors. From the salaries of officials there is being deducted from 1 to 3 per cent.

France and the Vatican

As was expected, the Vatican issued a formal protest against the visit of President Loubet to the King of Italy, since it involved the formal recognition of the Power which had deprived the Pope of his worldly dominion. The Pope calls attention to the fact that visits of the Heads of Protestant States to the Quirinal might be expected, but that such an act on the part of the ruler of a Catholic country, which has always enjoyed the special favor of the Church, cannot be passed without an expression of unqualified disapproval. The French Government had decided to take no action in retaliation for this papal protest, when the full text of the circular, obtained from some unknown foreign source, was published by M. Jaurés in his new journal, *Humanité*. From this it transpired that the papal note sent to France omitted a clause found in the copies sent to the other countries, threatening the withdrawal of the Papal Nuncio at Paris. This publication caused great popular excitement, and all papers, except the Clerical organs, called for retaliation. The French Ambassador to the Vatican, M. Nisard, was ordered to ascertain from the Papal Secretary of State, Cardinal Merry del Val, if the character of the note sent to the foreign Powers was as reported. As a result of this interview M. Nisard has been recalled. Diplomatic relations between France and the Vatican are not, however, entirely broken, but the First Secretary of the Embassy, M. de Navenne, is now in France, and the Second Secretary has charge of affairs. The Papal Nuncio at Paris, Mgr. Lorenzelli, still remains at his post, and M. Combes does not seem inclined to take advantage of the incident to push forward to a denunciation of the concordat, altho there is now a stronger sentiment in favor of some such radical action than ever before.

Brigandage in Morocco

The impotence of the Moorish Government is illustrated by its inability not only to suppress the long standing rebellion in the southern provinces, but to keep order near the coast. For over a year a bandit, Raisuli, has been committing depredations in the Gharbiya districts, only 20 miles from Tangier, until the roads have become unsafe and caravans ceased traveling. Last February a thousand cavalry were sent out against him without success. Last June Walter B. Harris, the correspondent of the London *Times,* was ambushed and held in captivity three weeks until exchanged for 16 native prisoners. On the night of May 18 Ion Perdicaris, an American citizen, and Cromwell Varley, his stepson, a British subject, were captured in his villa, three miles from Tangier, by Raisuli and a band of 150 men and carried into the mountains, where they are held for a ransom. The bandit chief sent back to Tangier for bedding, food and medicine. Both the British and American Governments have dispatched war vessels to Tangier, and the Sultan has been informed that he must secure the release of the captives immediately. Troops were sent to the mountains, but have been withdrawn on the demand of Raisuli, who refused to negotiate unless this was done. Mohammed El Torres, the representative of the Sultan of Morocco at Tangier, has sent to Shereef of Wazan to pay the ransom demanded and secure the safe return of the prisoners. Mr. Perdicaris was born in Trenton, N. J., 65 years ago, and is the son of a Greek refugee. He was wealthy and a patron of art, literature and the drama. For many years he has lived abroad, chiefly at Tangier, where his villa, formerly one of the palaces of the Sultan, was a cosmopolitan center of elegant hospitality.

The Condition of India

A Blue Book has just been published by the British Government which gives the complete results of the Indian census of March 1st, 1901; the largest enumer-

ation ever made and one requiring the assistance of 1,457,400 persons, but effected at a cost of only $750,000. Of the total area of India, 1,766,597 square miles, 61.5 per cent. is under direct British administration, as is also 78.8 per cent. of the total population, 294,361,056. The Native States, while comprising over one-third of the area, include much less than one-quarter of the people. The largest British province is Burma, but the most populous is Bengal, with 78,500,000 persons, or practically a population as large as that of the United States. Next come the United Provinces, 48,500,000, and Bombay, 42,500,000. Haidarabad with 11,000,000 stands first among the Native States. Two thirds of the people of India live on one-fourth of the area. The densest population, 1,920 per square mile, was found in a Cochin taluk, which had the heaviest rainfall, and as a general rule the population varies directly with the rainfall. The total increase in population in ten years is 1.5 per cent. The British provinces gained 3.9 per cent. and the Native States lost 6.6 per cent. Irrigation canals have been increased from 9,000 to 43,000 miles in the decade, and now secure 30,000,000 acres from drought. The growth of population is greatest in the most thickly populated parts, where there are 500 to 700 per square mile. In European countries the females outnumber the males, but in India, as in the United States, the males are in excess, the ratio being 963 females to 1,000 males. There is a marked and continuous decrease in the number of insane, deaf-mutes, blind and lepers in the last 20 years. The literacy is 53 per 1,000, or one man in 10 and one woman in 144 can read and write. Two-thirds of the people are supported by agriculture. About 16 per cent. of the population are rent-receivers, 36 per cent. rent-payers and 12 per cent. farm laborers. Industries promoted by Europeans, such as tea gardens, railways, mills and government offices employ 1 per cent. of the population. There are 147 languages reported, of which the Aryan Sub-Family include 25, spoken by 221,157,673 people; the Dravidian 14, spoken by 56,515,524; the Tibets-Burman 79, spoken by 9,560,454. The Aryan languages are spreading and displacing the older tongues. Classified according to religions, there are 70 per cent. Hindus, 21 per cent. Mohammedans, 3 per cent. Buddhists, 3 per cent. Animists and 1 per cent. Christians. The number of native Christians has increased by 31 per cent. in ten years. Most of the Christians are in the Madras Presidency, where 25 per cent. of the people profess Christianity.

The Japanese Advance Checked

It is not possible to judge accurately of the importance of the movements of the two armies during the past, but it seems certain that the Japanese have not advanced as rapidly toward the west as was anticipated by themselves and by their enemies. As stated last week, the Japanese army divided at Feng-Wang-Cheng, sending columns west to Hai-cheng and northwest to Liao-Yang. These reached to within twenty or thirty miles of their destinations, but again retreated, pursued by the Cossacks nearly to Feng-Wang-Cheng. According to the Russian report, the northern Japanese division, numbering 20,000 men, came upon 32,000 Russians in a strong position sixty miles west of Feng-Wang-Cheng, and were repulsed with considerable loss on both sides. This involved the withdrawal also of the division marching on Hai-cheng. Heavy rains had made the roads very muddy and impeded the movement of troops, and especially the artillery, which the Japanese made such effective use of in the battle of the Yalu. A detachment of the Japanese advance guard was also sent north of Feng-Wang-Cheng, aiming for Mukden. It was attacked in a mountainous district by a detachment of Cossacks, and successively dislodged from four positions, extending over fifteen miles, the pursuit continuing to within thirteen miles of Feng-Wang-Cheng. When the Japanese movement westward to the Chinese Eastern (or Trans-Siberian) Railroad was checked, Niuchwang was no longer in immediate danger. All the Russian troops had been withdrawn from that point, except a town guard, and the Russian gunboat "Sivoutch," lying in

the Liao River, had been loaded with wood and oil ready to be fired before it should fall into the hands of the Japanese. On May 16th the Japanese had landed at Kai-Ping on the west coast of the Liao-Tung peninsula, twenty-three miles south of Ying-kow, the port of Niuchwang, and, after driving out a Russian force numbering 1,500, and destroying the railroad, they were proceeding toward Niuchwang, which they were expected to occupy in a short time. But the plans, or at least the movement, suddenly changed, probably on account of the stopping of the division which was pushing from Feng-Wang-Cheng westward to Niuchwang. The Japanese re-embarked from Kai-Ping and sailed south. The Russians then reoccupied Kai-Ping, and a force of 1,000 infantry and two batteries of artillery was again placed in Niuchwang. In the lower part of the peninsula the Japanese have been successful in landing more troops and supplies and in pushing the enemy back toward Port Arthur, but not without much loss, and the dangers and disasters to the fleet have prevented its co-operation with the army. The Japanese had planned to land troops at Kerr Bay, north of Talienwan, at the same time as they attacked the Russian position on the hight north of Kin-chau, but owing to the number of mines in the harbor the landing was not made, and the engagement at Kinchau, where two Japanese divisions, with four batteries of artillery, met three Russian regiments and drove them back, was ineffective. The loss in killed and wounded was 146 on the Japanese side and 150 on the Russian.

Losses to Both Navies

The greatest disaster which has befallen the Japanese during the war was the loss of the battleship "Hatsuse," which struck a Russian mine ten miles southeast of Port Arthur and sank on May 15. She was cruising before the harbor entrance to protect the landing of troops, when a mine was struck, and a few minutes later another one exploded. The vessel sank in half an hour with 651 men on board. About 300 of the crew were saved by the Japanese cruisers, which repulsed the flotilla of Russian torpedo boats and destroyers which were advancing to the attack. In the afternoon of the the same day in a dense fog the cruiser "Kasuga" rammed the "Yoshino," which sank in a few minutes, ninety of the crew being saved. The "Hatsuse" was a battleship of 15,000 tons, of the latest model, built in England in 1900, and one of the finest in either navy in the Far East. She was 400 feet long, had 76½ feet beam, drew 27 feet of water, had 16,300 horse-power and made 19.1 knots an hour. The "Yoshino" was a cruiser of 4,180 tons, 15,000 horse-power and carried 300 men. The "Kasuga" was one of the two cruisers purchased from Argentina in Italy, and the outbreak of war was delayed for some weeks until she could be brought to Japan by an English crew. In trying to clear Kerr Bay, near Dalny, of Russian mines the cruiser "Miyako" struck a submerged mine, which exploded under her stern and so damaged the hull that she sank in twenty-two minutes. Neither Talien Bay nor Kerr Bay have yet been available for the landing of troops on account of the number of mines placed there by the Russians; consequently the Japanese can have no good landing place near Port Arthur until they are cleared. A torpedo boat was sunk under the same circumstances only a few days before while engaged in destroying Russian mines in the harbor. The Russian protected cruiser the "Bogatyr," of the Vladivostok squadron, struck on a rock near that point, and was blown up after removing her armament. The battleship "Orel," of the Baltic squadron, which was being fitted at Cronstadt to go to the seat of war, suddenly sank during the night of the 20th, probably from the opening of the valves. It doubtless can be raised. The loss of the three Japanese ships this week make the naval forces near Port Arthur more nearly equal. The Russian fleet now consists o six battleships and a cruiser, the Japanese of five battleships and ten cruisers. Since the war began the Japanese have lost one battleship, two cruisers and three smaller vessels. The Russians have lost four battleships, two cruisers and a large number of smaller vessels. Vice-Admiral Skrydloff has gone to Vladivostok and raised his flag on the cruiser "Rossia."

Unpublished Letters*

By HERBERT SPENCER

Part II.—The Henry George Controversy

[Henry George published his work entitled "A Perplexed Philosopher" through the now defunct house of Charles L. Webster & Co., in 1892. Its sub-title, "An Examination of Mr. Herbert Spencer's Various Utterances on the Land Question, with Some Incidental Reference to His Synthetic Philosophy," indicates its scope and purpose. Mr. George collated and compared the views expressed in Spencer's "Social Statics" (1850) with his later views, particularly those expressed in "Justice" (1892), and charged the philosopher with having recanted in order to win the favor of the political and social leaders of England. Spencer had, indeed, so thoroughly revised his views on the land question that the change can only rightly be termed a practical reversal, even though he himself insisted on calling it a "modification." On this point, and on the arguments by which he justified his change of front, Mr. George had ample grounds for attack. Unfortunately, however, instead of devoting his work to an examination of these arguments, Mr. George slighted his opportunities and directed an attack on Spencer's charactor, wherein he was clearly and entirely in the wrong, and a further attack on Spencer's philosophy, for which he was wholly unfitted. The letters in this instalment were written from various addresses, chiefly London, and they are all addressed to Mr. Skilton. The letters will be concluded next week.—EDITOR.]

XXII.

January 6th, 1893.

DEAR MR. SKILTON: I have read the introduction to Mr. George's "A Perplexed Philosopher," and my secretary, Mr. Troughton, having gone through the book, has read to me sundry of the calumnious and vituperative passages. Of course, I shall say nothing myself. Even could I spare any of my remaining energy, now become so precious for doing what little more remains possible, I should decline to spend any of it in taking notice of such a publication.

My American friends may, however, if they like, take the matter up, and may effectually dispose of its libelous statements. By way of aiding them in doing this, I will put down sundry facts which they may incorporate as they see well.

In the first place, irrespective of numerous utterly false insinuations, there are two direct falsehoods, which it may be well to name and to flatly contradict.

The first of them is contained in the Introduction, p. 9, where he says I have placed myself "definitely on the side of those who contend that the treatment of land as private property cannot equitably be interfered with." I have said nothing of the kind. I have continued to maintain that the right of the whole community to the land survives and can never be destroyed; but I have said, not only in "Justice" ("The Rights to the Uses of Natural Media"), but also in my first work, "Social Statics," that the community cannot equitably resume possession of the land without making compensation for all that value given to it by the labor of successive generations. I have said that "all which can be claimed for the community is the surface of the country in its original, unsubdued state," and that "were the direct ownership of property to be resumed by the community without purchase, the community would take, along with something which is its own, an immensely greater amount of something which is not its own." The sole difference between my position in "Social Statics" and my more recent position is this: In "Social Statics" I have contended that the resumption of the land by the community cannot equitably be made without compensation, but I have there tacitly assumed that such compensation, if made, would leave a balance of benefit to the community. Contrariwise, on more carefully considering the matter in recent years, I have reached the conclusion that to make anything like equitable compensation the amount required would be such as to make the

* Copyright, 1904, by THE INDEPENDENT.

transaction a losing one; more interest would have to be paid for the capital required than would be received for the land. And beyond the conclusion that the transaction, pecuniarily considered, would be a mischief rather than a benefit, I reached the conclusion that the system of public administration, full of the vices of officialism, would involve more evils than the present system of private administration. No change has occurred in my view of the *principle* of the matter, but only in my view of the policy.

The second falsehood is the statement on p. 201 that "the name of Herbert Spencer now appears with those of about all the dukes in the Kingdom as the director of an association formed for the purpose of defending private property in land, that was especially active," etc. So far as I know, there is no such association at all. The only association which can be referred to is the Liberty and Property Defense League, of which the chief activities are really in defense of liberty; but I am not a member of that association. Among the "directors" of this league I am not aware of more than one duke—multiplied by Mr. George into "about all the dukes"—and my name *does not appear* among them. I have distinctly declined from the beginning to identify myself with the league, and the landed interest which in considerable measure it represents. Just that identification which Mr. George alleges, I have more than once refused to allow. Tho I approve of its aims as combating governmental interferences and have from time to time done something to further its activities, yet I have carefully avoided giving ground for the supposition that I was on the side of the land-owning classes in politics and interests. If he means the Ratepayers' Defense League, the reply is that this is not an association for defending landed property, but for defending the interests of occupiers, and I joined it as a ratepayer to check the extravagant demands on ratepayers made by the County Council, etc. (tho this league took but little part in the last C [ounty] C [ouncil] election). Further, tho on its general council, I am not on its executive council.

As to the alleged cultivation of social relations with the landed classes, it is sufficiently disposed of by the fact that ever since my visit to America I have been so great an invalid as to be prevented from going into society. Not once in the course of the last ten years have I had any social intercourse with those of the classes referred to.

By way of meeting the various counts of Mr. George's indictment respecting motives, I will set down the facts, which prove motives exactly contrary to those he alleges.

The first concern pecuniary advantages. The first line of his motto from Browning is "Just for a handful of silver he left us." The facts of my career are these: For the first ten years, from 1850-60, I lost by every book published; the returns not sufficing to anything like repay printing expenses. During a period of nearly ten years subsequently the returns on my further books were so small as not to meet my necessary expenses, so that I had continually to trench upon my small property, gradually going the way to ruin myself, until at length I notified that I must discontinue altogether: one result of this notification being the American testimonial. When, some little time after, the tide turned and my works began to be remunerative, what was my course? Still living as economically as possible, I devoted the whole surplus of my returns to the payments for compilation and printing of the "Descriptive Sociology," and this I continued to do for a dozen years, until, year by year deliberately sinking money, I had lost between £3,000 and £4,000 (over £4,000, if interest on capital sunk be counted). I finally ceased, not only because I could no longer afford to lose at this rate, but because the work was altogether unappreciated. This was not the course of a man who was to be tempted by "a handful of silver"!

The second line of his motto is "Just for a ribbon to stick in his coat." If, as it seems, this quotation is intended to imply my anxiety for honors, no allegation more absolutely at variance with well-known facts could be made. Mr. George may seek the whole world round before he will find a man who has more persistently declined all honors. Various learned societies in England and America and on the Continent, including among others the French Academy (which Napoleon III desired to enter and failed),

have offered honors to me, which I have declined. When, in the case of the Roman Academy, the election was made before my knowledge of it, I proposed to resign, and should have done so had it not been for the damage which it was alleged would be done to a then reviving learned body; and when I was made a doctor by the University of Bologna at the time of their eighth centenary, I intimated that I should make no use of the title. And nowhere, on the title-pages of my books or elsewhere, have I given any sign of the honors accorded to me. It is said that I seek political honors. Well, if so, I could not have gone about to achieve them in more absurd ways. In the last chapter of "The Study of Sociology" I have singled out Mr. Gladstone, at that time Prime Minister, as a sample of the unscientific mind; and more recently, in Chapter XXVIII of "Justice," I have singled out the then Prime Minister, Lord Salisbury, to ridicule his reasoning. So that by way of achieving honors accorded by the State, I have spoken disrespectfully of the two men who had in their hands the distribution of such honors.

Nor is this all. These men are leading members of the landed class, the good will of which I am said to be anxious to obtain, and I have almost gone out of my way to offend them. More than this is true. Taken in the whole, the landed class is practically identical with the militant class, in so far that the officers of the Army and Navy nearly all of them belong to the landed class. Nevertheless, I have never missed an opportunity in all my books of reprobating war and denouncing militant activities carried on by us throughout the world, and I have spoken of the aggressive actions of our troops, headed by these members of the landed interest, as filibustering and political burglary. Both the leaders and the rank and file of the landed class I have spoken of scornfully rather than otherwise.

Not only then is Mr. George without a tittle of evidence to support his base insinuations, but there is abundant evidence furnishing conclusive proof to the contrary. There is, in fact, no class which I have shown the slightest desire to please, but have rather in all cases done the reverse. From the very beginning I have been in antagonism with the clergy, and have in many cases commented in strong words on their inconsistencies. I have spoken with utter disrespect of politicians, and in numerous places have at great length dwelt on the absurdities committed by the Houses of Parliament. So far as I can remember, I have nowhere said anything in defense or applause of the upper classes or the aristocracy, whether landed or other. I have criticised the scientific world upon more than one occasion, and have been careless of the offense likely to be given by refusing honors offered by scientific bodies. And, lastly, I have shown not the slightest endeavor to gain popularity, for I have opposed some of the most predominant popular beliefs time after time in strong language. The greater part of my political activity has been in opposition to the popular agitations for extension of governmental management and the doing of more and more things by public agency. And I have stood almost alone in resisting the current. As writes Mr. Saroléa, in his pamphlet, "Le Socialisme d'Etat," my voice has been that of one crying in the wilderness—my protests "son restés sans écho et resont que des voix prêchant dans le désert." And not in this case only have I gone in the face of a strong public opinion, but also in the case of State education, which from my early days I have perpetually reprobated and have recently, in Part III of "The Principles of Ethics," in the chapter on "Parenthood," reprobated again in strong and even contemptuous language. This I have done at the risk of offending almost the whole public of England and America—the public on which I depend for the purchase of my books—and have thus been reckless of giving offense to those on whom I am chiefly dependent for my income.

I do not see how there could be a more flat contradiction of Mr. George's allegations than is afforded by all the facts.

If my American friends present this evidence in their own way, they will, I think, efficiently dispose of these abominable calumnies.

P. S.—Of course, if any of these expressions or statements are used, it must be with change from the first person to the third—"I" must everywhere be changed to "he." But it would be best

to change the whole expression into your own forms, using my statements merely as clues to the evidence which my books furnish and which you can quote.

XXIII.

[With an inclosure of printed matter relating to the Liberty and Property Defense League and the London Ratepayers' Defense League.—EDITOR.]

January 8th, 1893.

DEAR MR. SKILTON: The inclosed will enable you to say that you have before you the facts relating to the Liberty and Property Defense League and the London Ratepayers' Defense League. You will see that in the first of these there is no duke among the directing body, and that my name does not appear in it; and, as I have explained, I am not a member at all. The other has on its central council (not *executive* council) the names of two dukes, and in the list of this council there occurs my name along with the names of 28 untitled persons.

This is the only political body with which I am connected, and I joined it some year and a half since in my capacity as occupier and ratepayer to resist the extravagant expenditure of the London County Council and the School Board. So it seems that I cannot join a body of ratepayers to avoid being still more fleeced without being charged with associating myself with dukes to protect landed property!

There is only one short word—not used in polite society—which fitly describes Mr. George.

P. S.—I should think that on showing him the facts, Mr. Webster would be shamed into abandoning the publication of the book.

XXIV.

January 10th, 1893.

DEAR MR. SKILTON: On second thoughts it occurs to me that it will be best not to use strong language in dealing with Mr. George. He is so unscrupulous and venomous that it is undesirable to give him a handle. A simple statement of facts and inferences will be best.

XXV.

January 16th, 1893.

DEAR MR. SKILTON: If you, or Dr. Youmans, or some other who takes the matter up has published or is about to publish a letter about Mr. George, exposing his calumnies, it might not be amiss if you sent *marked* copies of the journal containing it to sundry of the English journals. It might, I think, be worth while to send such marked copies to: *Pall Mall Gazette, Star, Echo, Evening News and Post,* London; *Scotsman* [and the] *Edinburgh Evening News,* Edinburgh; *Manchester Guardian, Manchester Examiner and Times, Leeds Mercury.*

The report you saw with regard to my illness was correct, and, unhappily, one or other small inadvertence or misjudgment or other unfavorable incident has kept me very much below the mark. Still I am doing a little work. The last division of the "Ethics" is nearly all in type, and I hope will be issued some time in the spring.

XXVI.

February 4th, 1893.

DEAR MR. SKILTON: If any such letter or article as that which you describe is written for the *North American Review* or any other periodical, it might fitly end with a fact which alone would dispose of Mr. George's charge. I inclose herewith the documents which explain and verify it. If it is made use of, it is desirable to give a certain preliminary explanation, otherwise there might be pointed out a ground of skepticism which might go some way to cancel its effect. If you make use of it, I think it would be well to put it in something like the form I have appended.

[Inclosed with letter of February 4th, 1903.—EDITOR.]

The Liberty and Property Defense League referred to above, of which Mr. Spencer is *not* a member, tho some of Mr. George's statements would seem to imply his membership, is a society formed primarily for the purpose of defending the freedom of individuals, now perpetually invaded by State interferences, and secondarily for defending their property from the inroads of the tax-gatherer. Any defense of landed property is no greater than that which follows by implication; and how relatively subordinate it is may be seen in the report, which we have now before us, of its Parliamentary proceedings for the past year, in which, out of 52 bills opposed by the League, there are but 18 which concern land-owners.

That Mr. Spencer is a strenuous upholder of individual liberties and a strenuous opponent of State aggressions upon them, all the world knows, and naturally, therefore, he has all along approved of the general policy of the League, tho he has never become a member. An indication of this approval which he had just before given led to the expectation that he was about to join it and prompted the following letter from the Secretary:

7 Victoria Street, London, S. W.,
June 26th, 1888.

"Dear Sir:

"Unless you have any objection I propose to send the subjoined paragraph to the press.

"I am, yours faithfully,
"(Signed) W. C. Crofts,
"Secretary."

"Herbert Spencer, Esq.

"'Mr. Herbert Spencer and the Duke of Westminster have joined the Liberty and Property Defense League.'"

What was Mr. Spencer's reply to this letter? Did he show that he was desirous of identifying himself with the landed interest in so far as the League is associated with it? Did he wish to see his name advertised along with the names of dukes, as Mr. George pretends? He did neither, but did just the contrary. After the above copy letter to Mr. Spencer, which we have now before us on the officially-headed paper of the League, there comes the remark:

"Mr. Spencer replied by postcard, 27th of June, 1888, to the effect that he could not consent to the proposed publication of his name as a member of the League. He had found that the identification of his name with any political movement tended to weaken his influence in certain directions."

So that not only is Mr. George without a tittle of evidence supporting his charge, but there exists this evidence flatly contradicting it and proving absolutely that so far from being swayed by the motive which Mr. George alleges, Mr. Spencer is swayed by absolutely opposite motives.

This single fact rips up Mr. George's balloon from top to bottom and lets out all the gas at once.

XXVII.

March 1st, 1893.

Dear Mr. Skilton: We evidently take somewhat different views of the situation. You appear to look largely, or mainly, at the general question, whereas to me the general question is of no importance. The "Synthetic Philosophy" can take care of itself, and I dont' care a straw if it is attacked by Mr. Henry George or half-a-dozen Henry Georges, with as many popes to back them. Pray say nothing about it nor anything in defense of it. I should be vexed were any step taken in its support.

Similarly about the land question. I have never dreamed of entering into controversy with Mr. Henry George about that or anything else, and I should be sorry to see any one take up the land question on my behalf.

The only thing about which I am concerned is the personal question—the vile calumny which the man propagates, and the only question is whether it is worth while to do anything in the way of rebutting this. Whatever is done should, I think, be done at once; and, indeed, the delay that has already taken place seems to me injurious. Whatever attention the book has had is by this time probably dying away, and the rebutting of its false insinuations will now come rather late. People will be apt to say: "Why was not this said before?" But if anything is now said, it should, I think, be brief, taking as a basis simply the facts I sent you. You might properly limit yourself to the three facts: (1) The slighting of Mr. Gladstone when Prime Minister, as being one of the unscientific, notwithstanding that he is a large land-owner and then had the distribution of honors in his power; (2) the ridiculing of Lord Salisbury at the time when he stood in the same position, being an immense landed proprietor and having as Prime Minister the power of distributing honors; (3) the fact I last sent you with respect to the announcement of my name as member of the Liberty and Property Defense League coupled with that of the Duke of Westminster, the wealthiest landowner in England. And you might join with these an indication of the utter falsehood of George's allegations as to the associating of my name with those of a number of dukes, concerning which falsehood you have the documents before you.

P. S.—The passage about Mr. Gladstone is in "The Study of Sociology," p.

393; and the reference to Lord Salisbury in "Justice," pp. 240-43, which Mr. George had in his hands.

XXVIII.

March 23d, 1893.

DEAR MR. SKILTON: I have just received your letter of the 14th.

As this matter about Mr. George has been so long delayed, and nothing of importance, as you say, comes of the book, I do not care if the matter drops through altogether.

But if you do say anything, I think it may be well to limit your rebutting statements to those which are obviously capable of being made without coming through me. Those which I have cited to you concerning Mr. Gladstone and Lord Salisbury from the "Study of Sociology" and "Justice" are open to anybody, and the argument derived from them is purely impersonal and in itself almost enough. If you go beyond that, I think it might perhaps be as well to limit yourself to the exposure of Mr. George's barefaced falsehood in representing me as interested with a number of dukes in a society for defending landed property.

You have the printed documents showing this, and you may easily refer to them as documents published by the respective societies, without at all implicating me in the matter.

In this case you will say nothing about the instance afforded by my declining to be named along with the Duke of Westminster. This has the more obvious implication of coming through me, which is an implication which may with advantage, if possible, be avoided.

XXIX.

June 8th, 1893.

DEAR MR. SKILTON: I suppose that after this long interval it has been decided that no notice shall be taken of Mr. Henry George's book, and perhaps, on the whole, this is well. Now that six months have elapsed it seems undesirable to say anything.

Would you, as you have now no use for them, return to me those documents I sent you concerning the Liberty and Property Defense League, and the answer I gave to the suggestion that my name should be joined with the Duke of Westminster's as new members of it. These documents may perhaps hereafter be of service to a biographer.

I hope you are benefiting in health by the desistence from active effort in connection with the Brooklyn Ethical Institute.

XXX.

[The letter referred to was one from G. H. Papazian, of Boston, inquiring of Spencer why he had not answered the charges contained in Mr. George's book.—EDITOR.]

November 10th, 1893.

DEAR MR. SKILTON: I have this morning received this letter and have replied through my secretary as follows:

"Mr. Herbert Spencer requests me to say that his friends in New York have abundant materials in their hands for proving that Mr. George's charges are baseless and that his alleged facts are fictions.

"Mr. Spencer has left the matter entirely in their hands, and they, knowing Mr. George and knowing American public opinion, have decided that it is best to say nothing."

It strikes me as quite possible that this is a dodge of the Georgeites to raise a controversy.

XXXI.

[The letter referred to was a baiting one written to Spencer by a prominent disciple of Mr. George.—EDITOR.]

January 19th, 1894.

DEAR MR. SKILTON: Herewith I inclose you another letter prompting a reply to Mr. Henry George. Probably it also is from an adherent of his.

There are certainly reasons for thinking that the absence of a reply will be misinterpreted by very many people; but now the time which has elapsed is so great that, unless there comes some further provocation, a reply will seem strange.

The Democrats and the Presidency

III—TWO SENATORIAL POSSIBILITIES—GORMAN AND COCKRELL

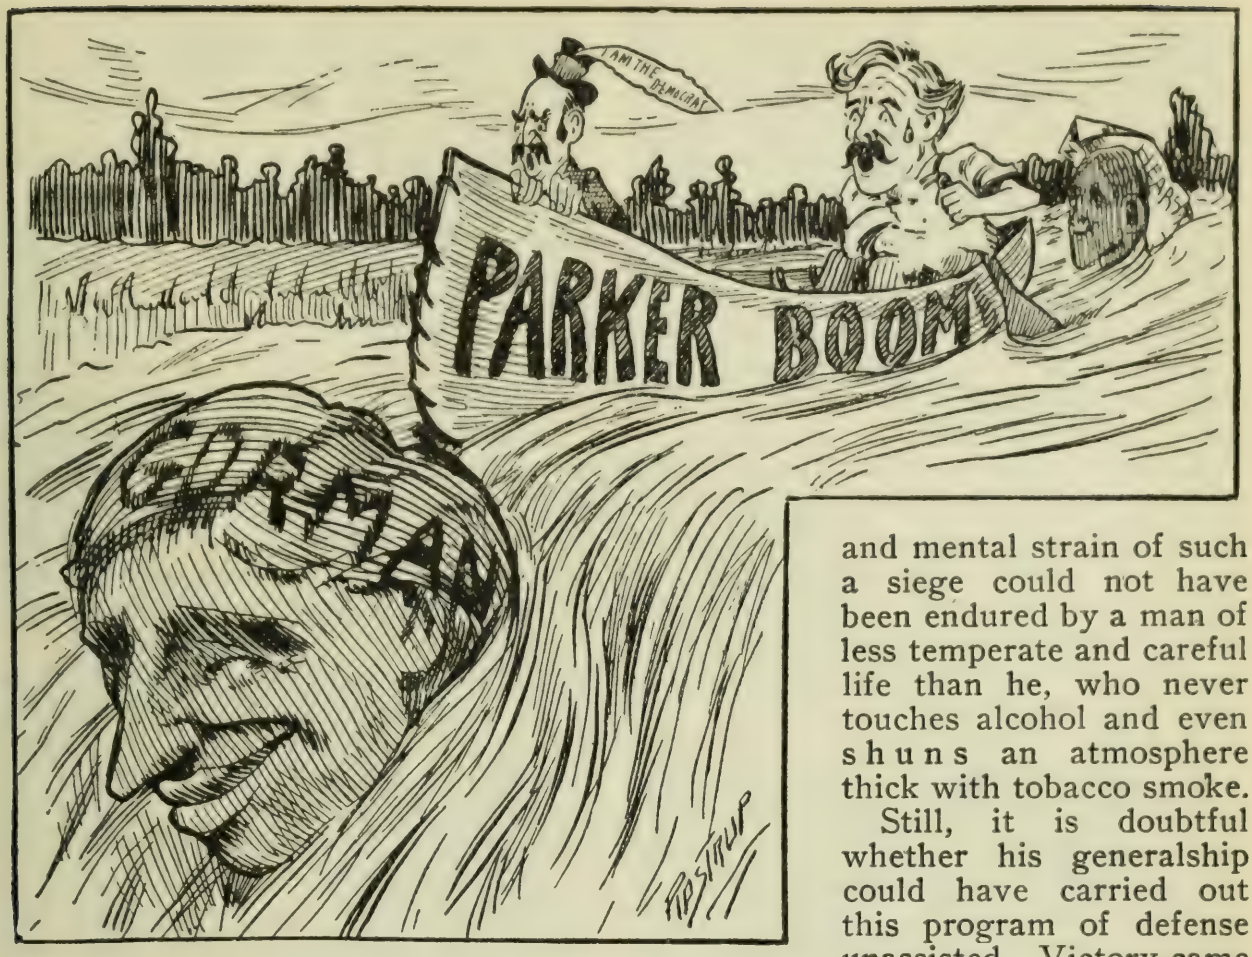
[This is the third article in our series of "The Democrats and the Presidency." We shall conclude in another issue with our anonymous publicist's views of Mr. Bryan and Mr. Hearst.—EDITOR.]

IN the early forties Stuart Robson and Arthur Pue Gorman were fellow pages in the United States Senate. Both had the same ambition, to be conspicuous—"great," they called it, measuring greatness by their boyish standards. Both achieved the eminence they sought, and by precisely the same means: imitation. Robson went upon the dramatic stage, and, as a stock comedian, mimicked men of all types and qualities and stations, from classic Dromios to Wall Street plungers. Gorman, with not less of the theatrical instinct, went upon the political stage with the distinct purpose of becoming a one-part star. After doing various small turns in minor halls he obtained an engagement in the United States Senate, where he made up after Stephen A. Douglas, and has played the statesman for a long run with varying success.

ARTHUR PUE GORMAN

This analog is not suggested in disparagement. Not all our actors, by any means, do their mimicry so well as Mr. Gorman; few have made it so serious a life work as he; still fewer have found it so profitable in the material sense. Above all, in his case, rises the rare quality of unconsciousness. What made the elder Booth so great in certain parts was that he lost himself in them. From the moment he took his last look at his costumed figure in the glass, his identity was merged for the while in the thoughtful "Brutus" or the fiery "Richard." So Gorman, with his obtrusive face clean-shaven, his well silvered hair brushed back smoothly, his dignified frock coat and his statuesque attitudes, is the typical lawmaker and leader as we know him from the portraits in the school histories.

The evolution of Gorman was very simple. He was a poor boy, and at an age when most lads are forming their ideals and planning their careers in the unpractical atmosphere of the schoolroom he was put out to earn his living as a page. Here he learned that policies count for more than principles in the large world; that surface is the real thing till substance crops through it; that righteousness has a hard time without tactics for a handmaiden; that compromise is always trumps in a game where the court cards are well scattered; and that true political leadership consists in jumping with the cat, but jumping a little further. These bits of proverbial philosophy became as much his guide in life as a manual of canned deportment is to the self-made Chesterfield. The boy Gorman resolved to be a Senator. Most Senators have adopted some or-



dinary calling originally with a notion of sticking to it, but finally sought the upper chamber of Congress as a reward for public services rendered elsewhere, or in recognition of their prominence in fields of private endeavor, or to "round out a career," or to get even with somebody, or to be able to protect some interest which is liable to be a target for legislative assault, or for the sake of social prestige in a community of office-holders.

None of these motives actuated Gorman. He chose the Senatorship as a calling, just as he might have chosen to sell dry goods or drugs. Close proximity to it during the plastic period of youth satisfied him that the stock in trade for it did not include necessarily any deep-rooted convictions on public questions, any expert knowledge of economics, any special drill in the history or art of legislation. Given a sufficiently impressive personality, a deliberate manner, a fair command of language, a voice of considerable resource, and temper and tears that can be controlled by a spigot, and what more is needed? There have always been good logicians in the Senate without any gift of oratory, and elocutionists destitute of ideas, and both have been failures as the outside public regards such things. Gorman contrived to make a place for himself midway between the two classes, by never attempting the impossible in debate, but letting others get into tangles and then shrewdly guessing at the psychological moment for intervening with a cool word. The invariable effect of such intervention is that all the participants, in gratitude for their relief, attribute to his far-sighted statesmanship what is really nothing more than a fair stroke in opportunism.

Gorman took his seat in the Senate at a fortunate time. In 1881 there were Democrats of national fame in that body, like Thurman and Hendricks, Bayard and Pendleton, Lamar and Ben Hill. They were all much older men than Gorman. With their accumulated wisdom they could steer their party through the really dangerous places, while Gorman could watch his chance to put in effective work here and there as a volunteer lieutenant. Along came the Presidential campaign of 1884. The National Democratic Committee was looking for a chairman. Gorman, recognizing Cleveland's great basic strength as a candidate, put himself in the way of being invited, and was. Most of the old-line Democrats had been sorely disappointed at the outcome of the convention, and felt little real sympathy with, or faith in, the Cleveland movement. Gorman saw his opportunity and improved it. The fact that he succeeded at all was enough to establish his reputation as a political manager, tho critical analysts of the result have sometimes challenged the credit given to him, asserting that a better equipped man in his place would have made a finer showing, since every sign indicated a Democratic year.

I am myself among those who have come to question Gorman's fame as a manager, in view of the bad judgment he manifested in his later activities. In 1888 he did all he could to prevent the Democratic National Convention from adopting its forceful free trade declaration, and to induce it to "straddle" the tariff question—a course which, as later events proved, would not have secured Democratic success then, and would have been fatal to it four years later. He opposed the renomination of Cleveland in 1892 and the adoption of a tariff plank which meant anything; and he headed the trio of Democratic Senators who stood out against the Wilson Tariff bill till it had been so amended as to promote the interest of the Sugar Trust. Commentators on the events of that period have generally attributed the wreck of the Democratic party to the irreconcilable attitude of the Western contingent toward Mr. Cleveland's financial policy; I regard it as due quite as much to the universal distrust of a national party in power that could be "held up" by three of its members while trying to carry its promises to fulfilment and compelled to accept subterfuges which satisfied nobody. It is such blunders as these which force upon an unprejudiced judgment a suspicion that Gorman's success of 1884 may have been due as much to momentum as to management.

And yet, in situations which admit of no *arrière pensée*, where compromise is out of the question, where the field is clear, the conditions are fixed, and all

AN OBSTRUCTION RISING.

From the *Times-Dispatch*, Richmond, Va.

depends upon the strategic skill of the combatants, Gorman is capable of making his mark as a tactician. Such a case presented itself in 1890. The Republicans had resolved to make a last stand for the force bill in the Senate. The Democrats were in a hopeless minority there, and the outlook was serious; for the long session was approaching its end, and the short session would be a bad one for the decisive battle, as the annual budget bills would surely get mixed up in the controversy. By common consent on the Democratic side, Gorman took command there. He laid the plans, watched for chances for delay or escape from day to day, was first at the chamber every morning and last to leave it every evening, presided at the secret conferences at which ways and means were discussed, held the Republican quorum up to its work against its will, and either himself led or prompted the other Democrats whenever a break in the enemy's line revealed a new point at which to direct a sortie. The physical and mental strain of such a siege could not have been endured by a man of less temperate and careful life than he, who never touches alcohol and even shuns an atmosphere thick with tobacco smoke.

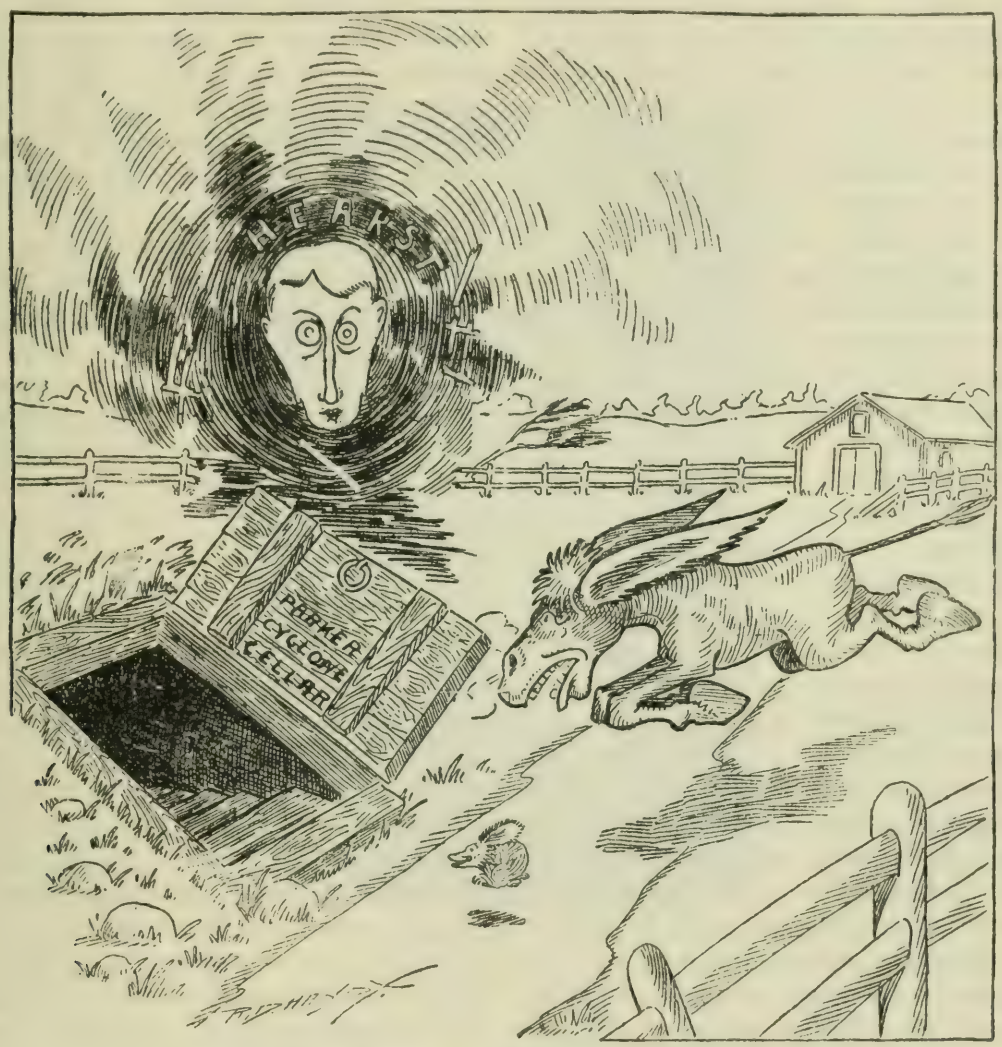
Still, it is doubtful whether his generalship could have carried out this program of defense unassisted. Victory came wholly through a diversion in a form calculated to raise the question how far morals and expediency can safely be permitted to drift apart in the conduct of such a fight. Senator Stewart, of Nevada, was leader of a group of Republicans from silver-mining States, who believed that their political salvation depended on their getting a free coinage measure through the Senate. From which side the overtures for a coalition came will perhaps never be known; certain it is, however, that when Stewart sprang his silver bill upon the chamber all the Democrats save three voted for it, and Gorman was not one of the three. For this favor, the Silver Republicans helped the Democrats sidetrack the force bill, and the fight was won.

To critics who have questioned his right, as a Senator from a sound money State, to vote for a bill that threatened financial dishonor to the nation, Mr. Gorman's apologists have offered a good many ingenious but sophistical excuses. I do not believe that Mr. Gorman himself would ever offer one of those specious pleas in his own justification.

It was enough for him, doubtless, that he was doing something in violence to his honest convictions in order to serve his party; just as when, after Bryan's nomination in 1896 on a free silver platform, he addressed a mass meeting in Baltimore and urged his friends to support the ticket because it was Democratic and all the hopes of the people lay with the Democratic party. The man who was ready to vote for Bryan in 1896 need offer no explanation for voting for free silver coinage in 1891.

Looking back over his career in the Senate, what will strike most observers is the fact that, in nearly twenty years of active service, Mr. Gorman has not attached his name to a single historic measure except the bastard tariff of 1894, nor can any one recall an epoch-making speech he has delivered in debate. It is a fact that he has taken a considerable share in the discussion of appropriations, particularly for the navy, and that a few local and private interests have enlisted his aggressive championship. But of his notable efforts as an orator the only remnant that clings in the memory of most of us is a speech in which he arraigned President Cleveland for bad faith in writing his remarkable letters to the tariff reformers of the House, and then called up one Democratic Senator after another as a witness, in police court fashion, to prove the case for the prosecution. It was a spectacular performance, concentrating the attention of the country upon the Senator for twenty-four hours, but subjecting him to daily attack for as many weeks thereafter. All this goes to confirm what I said at the beginning of this article of the actor-like quality in his composition.

Personally—for he is a thoroughly genial man and a delightful companion apart from his character as a politician—Mr. Gorman would do the American people no discredit in the White House. In his own habits and his home life he is blameless. But I do not regard him as anything more than a very remote possibility. He has never appeared to me a man of Presidential mold. As far as his active candidacy is concerned, he seems to have given it its death-blow by staking everything on the turn of the Panama die—and losing. His expectation undoubtedly was to make President Roosevelt's coup the issue in the coming campaign. He expected that the Democratic Senators would respond unanimously, so ready to their hands seemed the ammunition for attacking the Administration. When the Southern contingent made it plain that some of them would have to vote for anything that promised an interoceanic canal, he fell back upon the idea of releasing the few who did not wish to be bound by a caucus rule, and establishing through the rest the Democratic attitude which should be maintained throughout the campaign. Even this poor resort failed him when he came to count noses and discovered that only sixteen out of thirty-three were willing to array themselves in apparent antagonism to the Isthmian project.



Senator Gorman is a Methodist in religion, and, tho a friend and admirer of Jefferson Davis, was a Unionist and a Republican during the Civil War. On the same side of the Senate chamber, and within handshaking distance of him, sits a Presbyterian elder who served in the Confederate Army in all capacities from private to brigadier-general, who held prayer meetings before every battle and then went forth to fight as he had prayed, and who belongs to the old-fashioned once-a-Democrat-always-a-Democrat school.

It would never occur to Francis M. Cockrell, of Missouri, to claim especial credit for his Democratic faith, as David B. Hill does for instance; he is a Democrat because he couldn't possibly be anything else, just as some men are teetotalers because liquor makes them sick.

Moreover, he is a democrat with a small "d" as well as with a capital. No man in public life is more genuinely of the people and fonder of them. To say that he knows every citizen of Missouri would, of course, be a wild exaggeration; but to say that he knows more of them than any other Missourian would not be far amiss, or to say that he knows more of those whom public men generally do not take the trouble to know. This is because he regards personal campaigning much as Senator Hoar regards the town-meeting, as a prime instrumentality of popular self-government. When he goes on a stumping tour in the interior of his State he gets down to fundamentals, not only in his method of argument, but in

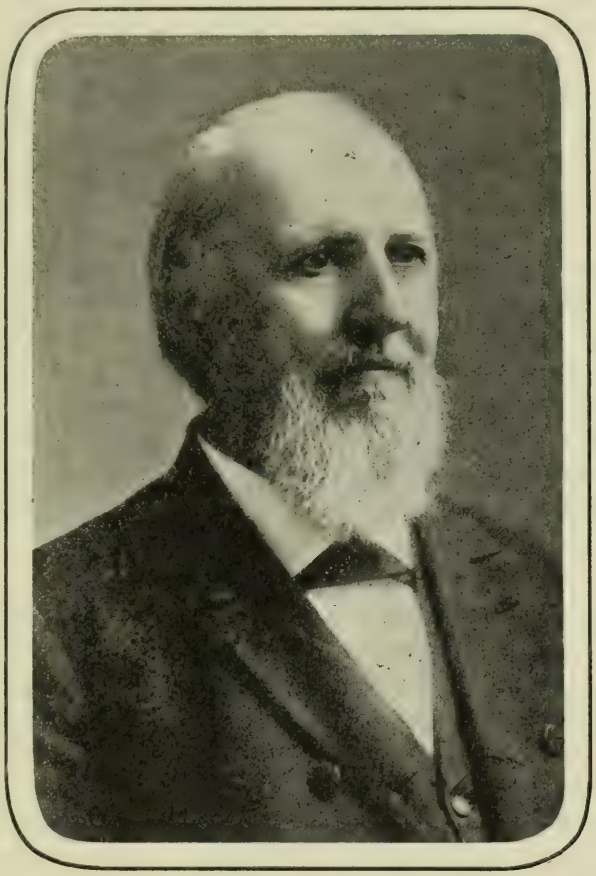
his audiences. It is the farmers and hired men who turn out in great masses to hear him, and his preference is to hold his meetings in the open air, where the largest number of people can gather within reach of his voice. They come in wagons or on foot from miles around.

After the speaking—which is always homely in style and concerns itself with public interests—the Senator comes down from his temporary rostrum to "say howdy." Every one who wishes to may walk up and shake his hand. What is more, he may be sure the Senator is glad to see him. With almost every grasp there comes some remark which shows that the ceremony is not perfunctory: "You must be old Joe Munyon's son—he and I used to go to school together;" or, "They tell me you had more rain last spring, up your way, than you wanted;" or, "Well! well! The last time I was around here you were a barefoot boy, and now you're running a blacksmith shop of your own, eh?" When the time comes to go home he climbs into somebody's wagon and is trundled off to a farm-house for the night, where he toasts his stocking feet before the fire till bed-time, smoking a pipe and telling stories, and setting all the household at its ease by his freedom from conventionalities.

The Donkey: "It's a case of any hole in a cyclone."

From the *News-Tribune*, Duluth, Minn.

Tall, lean, big-boned and awkward as Abraham Lincoln, there is also in his appearance a touch of the shrewd Brother Jonathan to which his protruding head, his keen, sharp nose and half-open mouth, his lank wisps of yellowish-gray hair and his stringy chin-whisker lend a sympathetic emphasis. An archeologist, trying to reconstruct his past from a study of its visible remains, would say that early in life a moustache and full beard had tried to assert their claims



on Mr. Cockrell's face, but had become discouraged and withdrawn in disorder. This incident may have been synchronous with the youth of the garments he still wears, for the Senator has a preference for old clothes and feels uncomfortable when "fixed up" for exhibition purposes. About his daily work he affects an ill-fitting and rusty suit of black broadcloth; Congress gaiters, of which the elastic sides have been stretched till their tops flare as if struggling to swallow the big ankle-bones that never quite get down into them; a black slouch hat, a turn-down collar, and black string tie. His trousers bag at the knees both fore and aft, and the bottom hem on one leg is apt to be caught up over the back strap of the gaiter below. It seems to be rather an imposition upon a person of his unconstrained ways to compel him to wear any waistcoat at all; so, while making a concession to custom, he minimizes the nuisance by leaving most of the garment unbuttoned.

A favorite article of attire with him in the very old times, by the way, was a white felt hat. If Champ Clark, his fellow Missourian, is to be believed, Mr. Cockrell owes his Senatorship to that quaint bit of headgear. He had not thought of the Senate in the early seventies, but had his heart set upon the Governorship of Missouri. The custom prevailed then, as now, of having the leading candidates for a nomination go personally upon the stump and let the people see them. Cockrell went everywhere, till the old hat had become as characteristically familiar as the chapeau of the First Consul. He was a cheerful fighter withal, and repeatedly declared that, if the honor went to any other good Democrat, no man in the party would give the winner a more enthusiastic support from start to finish. When the ballot was taken in the presence of a vast concourse of people, and Cockrell's chief competitor won the nomination by a fraction of one vote, a loud yell—something between a hurrah and a war-whoop—rent the air, and from the same place in the assemblage there flew into the empyrean a well-worn white hat. Thus everybody knew that Cockrell was as good as his word, and that this reception of the result would be but the beginning of a loyal and aggressive campaign in his rival's behalf. The idea caught the hearts of the crowd, and from that moment it was as good as settled that Cockrell should be the choice of his party for the next vacancy in the Senate. The opening came in 1874, with the expiration of Carl Schurz's term.

It is not alone at home that Mr. Cockrell maintains close touch with his constituents, but a thousand miles distance does not affect his neighborly ways when he is in Washington. There is not a service he can be called upon to perform for any of them that he will not attempt, and usually with success. If they send him a petition to present to Congress, he does not throw it into the hopper in the usual happy-go-lucky manner, but has the names of the responsible signers read from the clerk's desk of the Senate, so that they go into the *Congressional Record;* then he mails a copy of the *Record* to each, who is thus convinced that his Senator has him personally in mind. No letter received by him from a Missourian is regarded as too insignificant for an answer if one is evidently expected, and the chances are that it will be written in the Senator's own hand instead of being left to an amanuensis. It is no uncommon thing, while some routine or inconsequential business is in progress in the Senate, for Mr. Cockrell to send for a small library of reference books and documents, which he piles on and around his desk and falls to searching for the answers to the questions propounded by his correspondents. The documents, if they are to be had in quantities, he will send to the inquirer, with pertinent passages marked in pencil on the margins; from the reference books he will laboriously collate the material desired and copy it out. Fortunately, he comes from a State where profound scholastic research has no popular vogue, else his odd moments might be employed in looking up the history of perpetual motion, the various formulæ for squaring the circle, and the possible sources of some obsolete Greek particle.

To watch him as he sits absorbed in his correspondence and the unearthing of fresh data for it, regardless of the speechmaking going on around him, a careless critic would be apt to set Mr. Cockrell down as an absent-minded person. He is really the reverse. Let a

routine debate be interrupted for a moment by a Senator's request for unanimous consent to take up a certain bill for passage, and Cockrell is as alert as a boy of sixteen. "Let the bill be read for the information of the Senate," he calls out in his piping voice; after the reading, he must ask all the questions he wishes to and have them answered satisfactorily, too, or not another step will he allow to be taken; and, if he knows the measure and dislikes it, his "I object!" settles its fate in a jiffy. So well is it understood that not one thing in ten thousand can get past Cockrell unobserved, that his experienced associates on the floor regard it as the part of wisdom to consult him beforehand when they have any project to spring suddenly upon the Senate; and if his voice has not been heard in inquiry or objection before the chair puts the request for unanimous consent, it is a habit of the clerk in charge to glance over at the Missourian's desk for a consenting nod, which means: "I know all about this; go ahead."

FRANCIS M. COCKRELL

On the economic issues Mr. Cockrell is what might be expected of a life-long Democrat from a Southwestern border State. His seventy years have perhaps tempered slightly the radicalism of his youth, but have not reduced the strength of his conviction that free trade is the ideal condition for a healthy national growth, and a tariff confined strictly to revenue the only kind consistent with the Federal Constitution; that gold and silver were the money metals of the fathers, and therefore ought to fulfil the same office for the sons and grandsons in such equipoise that neither Wall Street nor the silver kings shall be able to hold the plain American citizen by the throat. On civil service reform he has one pronounced opinion: that the Pendleton law is very good if applied only to the actual clerical places, where a test of a candidate's ability to read and write letters, cipher and keep books will reveal his availability for public employ, but that the reformers are trying to crowd it into fields which Congress never intended it to occupy. He is never blatant. Tho loyal to the behests of his party in 1896, he let William J. Stone do the shouting for Missouri, while he went on with his regular work, and the special campaign duties assigned to him, with as little disturbance of the atmosphere as practicable.

Altogether, while Mr. Cockrell would not cut an elegant figure in the White House, he would be a fairly safe President, and could be trusted to listen there with conscience and an open mind, as he does in his present position, to all sides of every question, and to make up his judgment by his best lights, disregarding prejudice. Another Western candidate used to say of himself that if he ever were elected President, "there would be less manners and more honesty in the White House for four years than had been seen there for a generation." Such a remark would be impossible with Mr. Cockrell. He has never, I believe, cast any reflection upon the character of the Presidents of either party; his quarrel has been with their political principles, or with their mistakes of administration, or with the organization from which they sprang. Strong partisan as he is, a kindlier censor of his political foes does not exist.

It would be hard to find two men more

unlike in most of their personal peculiarities than the brace of Senatorial possibilities treated in this paper. Gorman, with his sophisticated manner and his great respect for the outward dignities of office, could never have got the grasp upon the popular good will that Cockrell has in his own section of country; on the other hand, in the North and East, in these later days, a man of Cockrell's type would have in his own personality a heavy handicap to overcome. Altho Gorman was a Unionist in a border State at a time that tried men's souls, and saw his own father die a victim of Southern suspicion and hatred, these facts would operate hardly more in his favor than Cockrell's service under the stars and bars would militate against him now: both have in the interval moved so far away from the standards of their youth as to reduce the latter to mere ineffective memories. Cockrell is so thoroughly reconstructed that he wondered at the reluctance of Cuba to become a member of the sisterhood of States under the best Government the sun ever shone upon; Gorman revived the race issue as the most important political problem to be settled in his own State, and sounded the tocsin for a movement to strip the negro as far as possible of the benefits of the Fifteenth Amendment. Gorman's hope of getting the nomination is, as I have indicated, very remote. His persistence even as a receptive candidate I believe to be due chiefly to his desire to control the situation in case of a deadlock between the "favorite sons" of other States; for the candidate who in such an emergency withdraws his name and throws his delegation to the right competitor may thus become the overshadowing influence in the next administration of his party. Cockrell's supporters seem to be in earnest in asking for his nomination now, tho it is whispered in some quarters that they are merely playing for position. This theory recognizes the improbability of his election, but assumes that by 1908, when the unique figure of Roosevelt will be out of the path and a fair opening offered for a Democratic sweep, Cockrell will be too old to claim a renomination, and it will be everybody's chance, with some good new material in the field.

A May Morning

BY E. P. POWELL

AUTHOR OF "OLD FARM DAYS," "WINDBREAKS, HEDGES AND SHELTERS," ETC.

"Come forth, sweet dreamer! break the thrall
Of wasteful sleep! Obey the call
Of her we hear—the Maiden May,
To live one rhythmic perfect day."

APRIL showed us patches of green, but there were white snow banks, where winter turned back on his tracks, caught the bees away from their hives, shut the birds into evergreen retreats, and after a deal of changeable freakishness, ended by yellowing the willows, taking the red out of the dogwoods, and putting the green back into the arborvitæ hedges. Everything was preparatory, and uncertain, to the very end of the month. One day the farmers plowed, the farm boys whistled, the bluebirds caroled, the robins chose mates; and the next a snow squall drove everything to shelter. Only the daffodils faced the conditions bravely, and the scarlet maples shook out their tresses of bloom. It is always fortunate for the fruit grower if April be a cold month. If the buds are started early, late frosts will nip the fruits, just as they get out of the calyx; and away in a single night go millions of bushels of berries and a large part of the peach and grape crop. A wise farmer always shakes his head if warm growing days come in mid-April and sweet south winds blow, and the maple buds swell into blossom. "A slow spring harvests bring," but "April too

fast, spring can't last." We have a tradition that there will always be one snow after the hyacinths bloom. It rarely does much harm for winter to shake out her skirts as she finally leaves us.

May is entirely free of this irresolution, and faces harvest days with resolute determination. We are out of the cold weather for good; but are not yet in the heats of summer. May is neither too hot, nor too cold. Its showers are soft and perfume laden. It carpets the whole world with violets, and swings perfume-laden blossoms from every bush and shrub. Wildwood flowers should begin even in March; but you will not find squirrel corn and violets in abundance until about May day. The evenings grow mellow, so that you can sit on a mossy knoll and smell the balsam of the budding poplars. At noon you may shut your eyes, and you will hear the bees through the upper air. What a roar! yet with your eyes open you had not heeded it! Now try your other senses, and you will find that there are sweet odors about you that you had not noticed—a whiff of mint from the glen brook, and lilac perfume ozoning the air. Then from somewhere behind the woods, a thin wave of smoke comes through the lower air—and with it comes a memory of just the same odor sixty years ago, when you were a boy, and burned some resinous boughs in the garden of the old red homestead. We think of memory as a distinct power, yet its ability depends on many a nudge from happenings. The red house is gone; the folk are gone; the pear trees are gone; the beds of pinks and the "sparrow-grass" bed are gone—but their counterpart is in your memory; perhaps in your character. Will some trivial event continue to call it up years hence?

On the lawns the hyacinths lift themselves somewhat stiffly, and I think assume to be the aristocrats of spring. By the tenth of May they have passed their prime. I do not quarrel with them, but I do not love them. My friends are the tulips. What gorgeous colors! and you may have all that you want of them. Let me tell you a secret: I have four large strawberry beds—altogether half an acre—and in every row tulip bulbs are planted, about six inches apart. By the middle of May these are all ablaze with crimson and scarlet and yellow and purple—in all combinations and stripes. The odor is wholesome, like that of a tea rose. Some of them are double, and some are single. But the glory of it all is their plentifulness; there are thousands—all nodding to me as I go about and throwing after me handfuls of fragrance. Tulips are wonderfully companionable. They will take their turn; but just as the modest strawberry blossoms begin to look up at them in amazement and admiration, will begin to drop their petals. Then the stalks will dry away; and when you go to pick ripe berries there will hardly be left a trace of the great show. Meanwhile we shall have gathered great bunches for the house and for friends. There is not a more persistent flower, unless it be a weed. If you dig out a bed of tulip bulbs, you shall next year go by the same spot, and lo! it is once more all ablaze. I even see a crimson flame in the lawns, or meadows, from which the bulbs were taken fifteen years ago. They are still multiplying in the sod, but doing no harm. Once in a while they get a chance to swing a beautiful cup of gold or crimson in the orchard grass, and they take their chances. In a bed tulips never crowd their neighbors; only they must be transplanted once in three or four years, or they will crowd themselves. They multiply faster than potatoes.

May is pre-eminently the shrub month. It is amazing what a wealth of blossoming is just now going on all along the forest edges, and by the fence rows. Our lawns ought to be of the same sort—a revel of the beautiful. About every country house half an acre may easily be given to lilacs, syringas, judas tree, loniceras, thorns, ribes, barberries; and where they thrive, why not live in a big patch of rhododendron laurels and azaleas? The whole world has been made to contribute to our shrubbery, and art has added its creative power. Think of forty varieties of lilacs! Yet, why not? You will add not only to your own pleasure, and the attractiveness of home, but you will double the value of a good farm by making it beautiful.

Yet, if not in a shrubbery, at least live in an orchard. The whole world has nothing more beautiful than a grove of apple trees in blossom, or in fruit.

Around the house let them grow in grove form, as the Indians planted them—and not in rows. The uniqueness of growth is as beautiful as the florescence. A Greening and a Spy never look like each other—you cannot force them to limb up after sunshine in the same way. The Swaar is round headed, and the Spitzenburg is flat headed. The MacIntosh is very unpretentious—as if it would say, Just wait till you see my apples! then you will look at me, and when you taste them you will love me.

Japan is a curious land, and the Japanese are a queer people—that is, to us. We write sonnets to a sweetheart's eyebrows; they to plum blossoms and cherry trees. They have developed from a wild cherry, varieties, culminating in that which bears pink-tinged and double blossoms, as large as a hundred leaved rose—covering every branch and twig with rosettes. The people flock to the great cherry parks by thousands, and mingle poetry with worship. "It symbolizes to them that delicacy of sentiment and blamelessness of life which belong to high courtesy and true knightliness." There is a fellowship between the animal and vegetable worlds that crops out here and there very strangely. When an unusual winter destroys our plum and cherry buds, so that we do not have a good showing of their blossoms in May, spring has no possible compensation. The smell of the tree and of the flowers conveys the sensation of wholesomeness. Yet in our love for the cherry there may be a good deal dependent on unconscious memory. Many years ago the old homesteads of our boyhood were surrounded with cherry and plum trees, but we had few apples and pears. Plum preserves and cherry pickles are associated with our earliest sentiments. How much of our to-day's joy is unconsciously hooked onto that of childhood? And how can you ever make a heaven unless it be largely of these stored pleasures—the golden pavement and jasper walls of youth?

I do not know how well to interpret the first warm showers of spring. They generally come in the night, and the first drops on the roof and window panes create a soft repose, that is better than sleep itself. Occasionally in the dark a catbird will sing out, with sheer joy, and after a few notes, of a musing sort, will drop off to sleep again. This is one thing I long to see; for I know not how the birds sleep in the hedges and evergreens, not minding the mellow rain. To them it says cherries, but to us cistern water. I think our lives are far more prosy than birds' lives, and not so complete. They know nothing of dirty clothes. While the bird chorus rolls over at about four o'clock in the morning, go out of doors and you will see a teardrop in every violet; but when the sun gets higher, inside each tear there is a rainbow. It is a wonderful way that Nature has of making the most common the most beautiful. But in the morning Nature is always an artist, as she is a musician.

> "The sun drinks dry the cooling dew;
> The oriole gleams the garden thro;
> The breeze goes whispering everywhere,
> Vain wisdom through the careless air.
> Now sleepy flowers adown the lea
> From perfume dreams awake the bee;
> The drapery of his couch unfold,
> And yield him honeyed wealth untold."

There is to me no companion quite equal to a brook—a small brook, that runs down through your garden, where you can go in May, and sit on the stones and hear it talk. No, there is nothing so full of languages as a brook. It makes new articulations at each trifling bend. It plays on the stones a melody of good will. Not a passion or an emotion but it can express. Thoreau says:

> "A pure brook is a beautiful object to study minutely. It will bear the closest inspection—even to the fine air bubbles, like minute globules of quicksilver, that lie at the bottom."

But it is this articulation in Nature which most bewilders me and draws me. The nearer anything comes to talking the nearer it gets to the human. So I go all up and down my brook, making seats of turf or stone, and it tells me many things that I cannot learn elsewhere. While I sit looking, listening and smiling, my collie comes up to me, and looks up into my face inquiringly, then wags a puzzled tail. Her language is in her tail, and it is eloquent. Will you think for a moment how Nature is struggling everywhere to find expression?

"The brook, with meditative mood,
Brings low, wild music from the wood;
And in the orchard cool finds rest,
With apple blossoms on its breast."

The pink petals not only ride in the pool, and come dashing down the brook, but eddy all around my head, and light on my arms.

It is time now to swing our hammocks. These are foreign to New England ideals. They are imported expressions of irreligious rest; of time that is not devoted to work. But the newer creed of the new religion of the American people will surely admit as one of its most important articles, hammocks. One hour after dinner, swinging under an apple tree, or in a living arbor of pine, or under the great-armed basswood, will go far to put an end to those neurotic symptoms which have so sharply developed under our high-pressure education and high-pressure money-making. Better get sleep for one hour, while the breezes play in the boughs overhead, and bring fragrance from the cherry trees, or from the apple trees, to charm and soothe your senses. You can have the latest nature-book in your hands, but generally shut it up and study Nature herself.

The later birds are now coming in to take possession of their property. My catbirds own my acres, my orchards and swales quite as truly as I do myself. They do not like cold weather, and take no chances on food. Robins and bluebirds come back to us between the middle of March and the first of April; the song sparrows soon after, and the grosbeaks are probably here by the last of April. The swifts, with remarkable precision, touch us on the 22d of that month. They always come in a flock, and can be seen dividing up into groups for their specific localities. I have never seen a flock of robins arrive. They always get here in the night. The catbird reaches us about the 10th of May; but a courier comes on ahead, and for several days is looking over the condition of affairs. I presume he communicates, through a line of couriers, to the main body of the catbirds. May is pre-eminently the bird month. They sing now all day long. Not seldom there are such visitors dropping in on us as the Southern mocking bird and scarlet tanager.

Your Rural Art Society, if you have one, as every village should have, meets about now, to consider the cleaning of streets and the planting of trees. It is a curious feature of these public efforts that they rarely get ready for work until the possibility of work is already passed. It will be quite too late to plant street trees before the discussion is over; but it may lead to action in the fall or another spring. Sooner or later the deed will follow the thought. Just now both city and rural improvement is in fashion; and I believe it is even beginning to displace genealogy among our mothers and daughters. There is just about so much moral force in a community, and just about so much intellectual information, and about so much common sense to make organic and operative for the individual and the public. How to prevent waste is a problem. May should always be notable as the improvement month. If every home grow a little more charming each year, and each village more attractive, and every highway more park-like, the substantial gain in a full generation will be very great. April is the housecleaning month, the bonnefire month, when the clearings are made. May should go farther, and set a new tree or bush; add a bed of roses, or even lay out a village park. George Eliot made the word betterment to be the symbol of the nineteenth century—that is, little by little. We shall never get to the best; and that is the most beautiful thing in this world.

One more thing is true, that we cannot make anything that for beauty surpasses our inner self. This is true of our gardens and lawns, that they grow out of our thoughts and characters. The effort to create arises from the fact that we have first learned to see and to appreciative the beautiful. The growth of ideals within us demands growing expression in our surroundings. A tree gets to be infinitely more than a tree. Judge Conger had a shade tree gnawed by a horse, for which the owner of the horse offered to pay damages. The judge said: "You poor fool, it took God one hundred years to make that tree; and you won't live long enough to make good the damage."

One end of literature, if not the best end, is to bring us all together in our joys

as well as in our knowledge. I should like, therefore, to share with you this wonderful May day in the country. Leave the roar of the city, its evil smells and contracted vision and sit down with me in a great field of dandelions—for the dandelion is the one democrat of flowers. It is the flower that most links us to everybody else. You may fill your hands with them, and carry home baskets full, for there are enough for all of us. Linnaeus studied the dandelion minutely, but all that he said of it is, It is the princeliest flower for gayety and freedom, the no-care flower. The birds are singing in the apple trees overhead, and helping to shake the pink petals through the air. All down the valley slopes the farmers are planting and trimming. The envious train slips in through the gap in the northern hills, but quickly carries its hurry and its worry out through the southern hills, and leaves us to the peace which I think never comes so completely as from a morning in May.

CLINTON, N. Y.

The Status at Washington of International Arbitration

BY JOHN W. FOSTER, LL.D.

EX-SECRETARY OF STATE

THE Conference which was held in Washington in January last, notice of which appeared in THE INDEPENDENT at the time, gave a new impetus to international arbitration. Its representative character, the strong body of men from every section of the country, and the hearty indorsement which it gave to unrestricted arbitration between nations, were unmistakably evidences that the cause had made marked progress since the first conference held at the national capital eight years before. In view of the enthusiasm awakened, strong hopes were entertained that some favorable action might be taken by our Government before the adjournment of Congress, then in session. But these hopes have been disappointed.

The cause for this failure may be found largely in the sentiment existing in the Senate on this subject, but also in considerable part in the peculiar situation which surrounded international questions pending in that body.

The contrast in the sentiment entertained by the Executive department of the Government and the Senate was shown in the treatment extended to the Conference. A committee was appointed to wait upon the President of the United States and the Secretary of State and lay before them the resolutions of the Conference, and a like committee was assigned a similar duty with the Senate Committee on Foreign Relations. The first committee was promptly received and heard by the President and Secretary of State, were assured of hearty sympathy with the general subject, and that they were ready to enter upon treaties of arbitration with foreign Powers as soon as they had some indication that the Senate would favorably consider them, its last action being of an unfriendly character.

Application was made in advance for a hearing before the Senate Committee on Foreign Relations, and upon assembling the Conference committee was notified by the Chairman of the Senate committee that he had been instructed to say that the committee was too busy to give them a hearing, but they could appear and hand in their resolutions, but that no speeches could be allowed. The Conference committee was headed by Governor Durbin of Indiana, and had among its members Provost Harrison, of the University of Pennsylvania; Francis

Lynde Stetson, Horace White and Chancellor McCracken, of New York; Samuel Gompers, President of the American Federation of Labor; representatives of the Chamber of Commerce and Boards of Trade of New York and Boston; Hon. Horace Davis, of San Francisco, and others, prominent citizens of Virginia, New York, Connecticut, Maryland and West Virginia. These gentlemen assembled in the room of the Senate committee at the hour fixed upon and found the Chairman alone present. After waiting a short time three others, out of a membership of thirteen, appeared, the resolutions of the Conference were handed to the Chairman, and these distinguished citizens retired.

It would hardly be correct to say that this reception was indicative of the hostility of the Senate Committee on Foreign Relations to the cause of international arbitration; rather it should be interpreted into want of interest in the subject. One of the most influential and able of the Senators said to me, when urging action on the pending Pan-American claims treaty, that he thought the sentiment in favor of international arbitration was largely manufactured. Such an expression from a source so controling would indicate that there was much missionary work to be done before we can hope for the success of the cause.

The question of the Isthmian Canal and our relations with Colombia had much to do with this indifference. The Colombian Government and a small party in the Senate were urging that the issues which had arisen on these subjects should be settled by arbitration, while a large majority of that body claimed that these were not proper matters for such a mode of settlement. The rejection of arbitration with Colombia made the majority a little shy for the time being of the general principle. On the other hand, the opposition claimed that it would be sheer hypocrisy to make treaties of arbitration with the great Powers, such as France and Great Britain, while we were despoiling weak and defenseless Colombia. So also the great additions to the Navy and the enormous increase in the annual expense of that branch of the service which were being authorized were pointed out as inconsistent with the principle of arbitration.

The decision of The Hague Court on the Venezuela cases was also referred to by Senators as having the effect to discourage arbitration. The reply was that this decision, altho disappointing, did not afford a ground for opposition to the general practice any more than an occasional failure to secure in domestic courts what we regard as our just rights would lead us to abolish the judicial system.

Only one arbitration treaty was before the Senate for action at the last session, and that not of great importance. When the American Republics met in Mexico in 1901-2, at their second congress, or conference, they agreed upon and signed a treaty for the submission to arbitration of all claims of private citizens against the respective Governments. This treaty was sent to the Senate for ratification during the Fifty-seventh Congress.

A strange indifference has been manifested toward arbitration with our sister republics. In the convocation of the first Pan-American Conference, based upon a resolution of Congress, the invitation issued by our Government mentioned arbitration as one of its chief objects. When the Conference assembled it was found difficult to bring two or three of the nations to an agreement on the subject. Our Government regarded it as of such importance that Mr. Blaine, then Secretary of State, went into the Conference and by his matchless personality and great eloquence brought about an arbitration treaty whereby all questions not involving independence were to be submitted to arbitration. In transmitting this treaty to the Senate in 1890 President Harrison stated that its ratification would "constitute one of the happiest and most hopeful incidents in the history of the Western Hemisphere." Notwithstanding the strong committals of Congress and the President, the treaty was never called up for consideration, so far as known to the public, and was allowed to die by limitation.

The arbitration claims treaty pending at the last session seemed destined to a like fate had not the friends of arbitration called the matter to the attention of Senator Cullom, Chairman of the Committee on Foreign Relations, who secured action on it by the committee, and in the last days of the session reported it

favorably to the Senate. There seems to be little doubt that this treaty would have been ratified if a vote upon it could have been reached before adjournment. We may confidently anticipate its approval by the Senate next winter.

It is understood that the French Government has asked Secretary Hay to unite in an arbitration treaty similar to the one already perfected between France and Great Britain, France and Italy, and other nations. Great Britain is doubtless ready to make a similar advance. So that it may be anticipated that when Congress convenes next December the Senate will have before it for approval several arbitration treaties. They will not be without influential advocates in that body. The President of the Senate, Mr. Frye, has already publicly announced himself as favorable to the movement. Senator Allison has made a similar announcement. Senator Cullom, Chairman of the Foreign Relations Committee, has shown himself in hearty accord. Senator Bacon, of Georgia, a prominent member of the Foreign Relations Committee, made a notable speech during the last session advocating arbitration as the fixed policy of our country. Other Senators might be named.

But the friends of arbitration must not be misled by these favorable indications. The rejection of the Olney-Pauncefote treaty, and the indifference and inaction herein cited, should lead them to the conviction that active work with individual Senators is required to secure a two-thirds vote in favor of these treaties.

WASHINGTON, D. C.

A Man's Relation to the Two Sexes

BY MRS. L. H. HARRIS

NOT long since I had something to say in THE INDEPENDENT about women in this connection. A Northern man thought the article was a "libel" on my sex, while a Virginian wrote to thank me "in behalf of all Southern men." And a publisher of religious books was so impressed with its Scriptural veracity that I was invited to submit the manuscript of a book of counsel to women. But of the score of women heard from, all are more or less indignant, and only one will even partially indorse what was written. Referring to the idea advanced that women are more nearly related to men than to one another, she said prettily, "I *feel* that it is true!" All depends, of course, upon the point of view. But while the subject is up for discussion we may as well consider what a man's relations are to the two sexes.

In the first place he is never dependent upon the love of other men. And if he sets about winning their affections, it is generally for religious or political ends, not because he actually feels the need of tenderness in their regard for him. What he does demand of them is respect, justice, co-operation, if he can get it. But the chief thing he desires of a woman is love. If he wants anything else of her, he first wins that, knowing, by a profound masculine intuition, that having given so much, she will not withhold any of the tender mercies of her heart from him. Thus we see men and women joined together in peace and happiness who have nothing in common but love.

There is, however, little basis between them for mere friendship. Doubtless Platonic love exists, but it is exceptional, out of the natural order. And it is like religion in that it is not practiced so much as it is professed. Even then women are more capable of the experience than men are, because they are especially gifted with the kind of innocence and ignorance upon which it is founded. No matter how enthusiastically a man undertakes a case of Platonic love, he is invariably the first to weary of the fallacy. It does not develop interestingly along his lines. There is not sufficient variety about it to hold his attention. In desperation, therefore, he will soon or late break the spell with an experiment. And he will not do it because he is a villain and a traitor, but

because he is a man and the party of the first part is a woman. Primarily neither was made for the Platonic relationship, and so it is really a more difficult one to sustain than that of marriage, to which both are happily predestined. The natural result of Platonic love is Plutonic love.

On the other hand, a man enjoys the comradeship of other men without becoming sentimentally attached or weakened by the relation. Their friendships with one another last longer than they do with women, because they are less exacting and because they do not burden each other with dangerous confidences as women do. Two men will work together, move in the same circle of society, be the best of friends without knowing one another as confidentially as a woman will after one informal conversation with either one of them. They may discuss philosophy, ethics, science until each thinks he knows the other like a book; but really they only know one another's minds. There is a plumed knight behind all these conventional articles of personality which no decent modest man ever reveals except to a woman. And the explanation is simple. He knows that other men would recognize this eloquent figure as a fiction created by the same sex instinct that makes the male bird's neck feathers more gorgeous than the female's. Originally all birds look alike, but the ambition to woo and to attract has added a variegated inch to his plumage which every lady bird finds hard to resist. Thus a man distinguished among other men for his stolid sincerity and punctilious honesty may be the greatest of all liars to women. And this is deplorable, of course, but not so great a fault as it seems. It may be merely his rhetorical manner of approaching the poetic sex. Besides, very few women can endure the stern, self-revealing truth from a man. It is a cruelty which they all pray against in their very attitude to men. Now and then a lover thinks he confesses his sins to the lady of his heart—the subtlest of all masculine flattery, by the way!—but if she only knew it, they are not his real sins; rather they are made into a romantic formula of unrighteousness and shadowed forth with such dark hints of bloodier doings as will appeal to her guardian angel conceit. And the wit of the thing is proved by the fact that many women, indifferent to the most ardent declarations of love, are easily won by an ideally penitent man's appeal to their superior goodness. This is so well known that the most virtuous men often affect the tragic air of unworthiness in the presence of the women they love but have not won. And back of this engaging humility there is the most gallant, the most delicate of reasons. It furnishes love's finest motive to the woman. "What excuse have I for marrying him?" she asks herself, for women are great hypocrites, sweet pharisees at crucial moments. Love is so nearly nature's confession, the best of them will not make it, and so she marries because it is a duty to save a man's soul if she can. And Heaven knows how sincerely they embrace this innocent hallucination! It would amaze us all to learn how many fat matrons believe they have preserved their husbands—always regarded as respectable, God-fearing citizens—from becoming blacklegs, thugs and gamblers. The poor gentlemen have never really done anything to justify the conviction, but it is an idea their wives treasure up from courtship days, when as young lovers they muttered darkly of their total depravity at the pretty feet of feminine virtue.

Where so much tenderness and confidence exists one naturally infers that they are the evidences of a very close kinship. But as a matter of fact, a man is no more related to a woman than women are related to one another. He is only poetically and sentimentally kin to her. The difference is not so much in character as in consciousness and in the woman's sense of wings. No man has the latter, but every woman is endowed with it, even the vampire kind. This is the psychological explanation of her preference for airy, diaphanous garments. She would suggest the ethereal by wearing "angel wing" sleeves, by the plume on her hat, by the very train of her gown. And she does. But while this lace and feather manifestation of spirituality appeals to the man's adoring imagination, it also convinces him that no trousered materiality can possibly be kin to such a furbelowed soul. Even in her termagant moods the same sense divides them in consciousness. Her plu-

mage is ruffled, indeed, but she is no less winged. And her mind usually acts in the same confused fashion observed in an angry hen bird circling distractedly about her roof tree. The man looks on phlegmatically and knows that he is of a different species. And this really explains that oft repeated question with which every woman challenges the heart of her husband, "Do you love me?" *She* is related in mind, body and spirit to a creature who is no more kin to her than the anvil is kin to the ring that is beaten and welded together on its surface. She feels this beneath all the bell-clatter of her fire-forged spirit, and the little question is a sort of near prayer which he never really hears. He answers automatically with all the love phrases in his vocabulary, but he never understands that she is seeking in his regions for the bond of kinship, *likeness*, because he has no such bond. He is intended to be reasonable, not emotional. His virtue takes the staid form of morality as hers does that of spirituality. With him charity is an intelligent philanthropy, with her it is a divine compassion easily in reach of the unworthy. With him love is a foundation, with her it is the beams of the temple. He never mixes his spiritual faculties with his romantic instincts; but no pefectly good and lovely woman can distinguish one from the other. She makes a religion of love.

And passing now from these close relationships to those less intimate, the man reveals a curious limitation in his social manifestations to other men. His brotherhood idea is not as ethical as it sounds. It is simply a political or industrial organization, and he is the last person to abide by it socially. He will embrace the brethren, but he won't invite them to dinner. He will hobnob "down town" with men who, to all appearances, are his natural affinities, and then refuse them admission to his home or his club. Nor is this all; at bottom he is antipathetic to most men in his own class when women's presence gives a romantic significance to a social situation. This antipathy rarely reaches the savage phase of rivalry or jealousy, but it is a sort of sex contempt men have for one another in the presence of another and finer sex. However, this is a sensation which men deny as indignantly as women deny certain feminine asperities.

But it is in a man's social relations to women that diplomacy reaches a fine art. If he is not in love with her, he treats with her apologetically, as if she were a dangerous foreign power, to be pleased into acquiescence—to be duped if necessary, but in any case to be conciliated. Generally, he does not care for her good opinion longer than the moment, but for that particular social occasion he will do much to avoid the wasp end of her tongue or the tragic end of her confidences. In short, he is always diplomatically prepared for a graceful retreat. And in this connection we may as well consider another singular masculine absurdity. No man ever recognizes the fact that a woman is cleverer than he is. He may tell her that she is, but really the idea is inconceivable to him. Among men he often recognizes himself as a dunce, but in the presence of women he will still strut like an intellectual hobgoblin. No matter how dull he is, he will venture the weight of his gravity against the lightness of a woman's wits every time. And this leads to a whole world of feminine experience where he is the eternal joke. Women are easily managed, once they are "in love," because then they give up their minds and follow their hearts; but, fancy free, the most stupid woman I ever knew can outwit the wisest man, provided he sticks to the ways of wisdom.

In old age a man does not change in his affinities as women do. Sixty years may modify and harden his disposition, but they do not change his nature. He desires to be loved by all women and respected by all men just as he did at twenty-five. He may have won wealth and fame, he may have served God and his country faithfully, but if he has not achieved the love of his womankind and the respect of other men he is lonely, disappointed, and a sort of failure from his own private point of view.

NASHVILLE, TENN.

No Sad Songs for the Brave

BY CLINTON SCOLLARD

TEARS for the weaklings! but for those who fought
And perished nobly upon land or wave,
No lamentation, no dark draperies brought,
No sad songs for the brave!

But rather jubilation,—peal on peal
Of joy-bells,—Hope's white lilies 'neath the sun,—
Because they died with sacrificial zeal,
Their patriot duty done!

CLINTON, N. Y.

China and the War

BY ARCHIBALD R. COLQUHOUN, F.R.G.S.

[Mr. Colquhoun is not only known as an authority on all Far Eastern questions, but his latest book, "Greater America," just published, is largely a discussion of the problems of expansion and the future of the United States.—EDITOR.]

WHILE all eyes are turned to the Far East, whence come such bare and partial official reports of the conflict now proceeding, it must be a matter for wonder to some people that China, the bone of contention between the belligerents, makes no sign and is hardly alluded to in dispatches from the theater of war or discussed in the press of either England or America. The intervention of the Powers—European, of course—is freely canvassed, but it seems outside the range of practical politics to suggest that China,—great in numbers and resources, great, therefore, in potential strength, but weak in policy,—may weigh for something in the scale. And yet, as I endeavored to show in a previous article, there are forces working in the heart of the Celestial Empire which cannot be without influence on the future of the Far East. Dawn is breaking in the land of darkness, if such a spiritual metaphor can indeed be applied to what is, in fact, a materialistic renascence. The word "efficient" has penetrated the arcana of Chinese civilization, and there is every reason to believe that in a short time the enormous reserves of energy pent up in the Chinese people—physically and mentally among the finest races of the world—will be directed into practical channels.

The new era for China undoubtedly dates from her defeat by Japan, accentuated by the humiliations suffered at the hands of foreign Powers. The strong points of Japanese influence have been indicated already, but as Pekin has long stood for China to the average Occidental, it may be useful to trace the exact growth of that influence within that city of diplomatists.

At the time when the *coup d'état* at Pekin (1898) cut short the reform movement in China, the influence of Japan received apparently a severe shock. It was hardly recognized at that time that Japanese influence was at work, for the reformers drew their inspiration rather ostentatiously from the West. In this connection it is necessary to recount briefly the main features of a palace intrigue which has had a lasting effect on the fate of China.

The one military officer at this time holding a command of importance who was known to be in favor of reform was Yuan Shi-kai, the commander of some 12,000 trained troops in the neighbor-

hood of Tientsin. He was approached by the Emperor's party—the Reformers—with a view to disposing of Yung-lu, the chief of the Empress Dowager's party, and to seizing the person of the August Lady herself. What actually happened is not known. According to general rumor Yuan Shi-kai, after deliberately weighing the chances, betrayed the whole affair to Yung-lu, who thereupon hastened with troops to Pekin, and, with the help of the Empress, carried out the *coup d'état,* which amounted to the deposition of the Emperor. The Empress Dowager is credited with the idea of retaining the unfortunate Kuang Hsu as a puppet. The part played by Yuan Shi-kai must not be judged altogether by our own standards, for, apart from the question of his own personal risk, it is now conceded by many Chinese reformers that the Emperor's program was under the circumstances visionary and revolutionary in its tendencies. Yuan's own account is that he would have acted for the Emperor had he received an order signed with the Vermilion Pencil, but this unmistakable evidence against the Emperor, in case the plot were not successful, was considered to be too compromising by Kuang Hsu's advisers. In any case, whatever the ethics of the situation, Yuan Shi-kai gained the whole confidence of the Empress Dowager, and he has risen in an unprecedented manner, while retaining his own predilections in favor of reform.

As this personage will inevitably be heard of before long as the one strong man China possesses since the death of Li Hung Chang and Liu Kun-yi, and as he is little known in Europe and America, it may be interesting to note some points in his character and career. He has a remarkable record, being originally a military mandarin of humble origin and, for a Chinese official, very illiterate. As official appointment and preferment in China are reserved for the literati or for Manchus with influence, it must be inferred that Yuan has exceptional abilities to have achieved his present position of Viceroy of Chihli and Commissioner of Northern Trade, a position which in the hands of a strong and capable Viceroy can be made one of commanding influence. This view is confirmed by all who have come in contact with him, and especially by Europeans, who find him straightforward and broadminded, progressive and strong in character, with clear views as to the future of his country. The Chinese say he is no "man of precedents"—no small compliment in a country so bound with red tape. His fame is the most widespread and his opinions are the most respected among Chinese statesmen of to-day, and he is called by his countrymen "the hope of China." Chang Chih Tung, his one possible rival in public estimation, has not fulfilled the hopes once entertained of him. His reputation for honesty still remains and his character is therefore respected, but since he was summoned to Pekin and retained there he has sunk into obscurity, and, it is rumored, has fallen entirely under the influence of the Empress Dowager. The Chinese have ceased to expect any great things from him.

The rise of Yuan Shi-kai has been extremely favorable to the growth of Japanese influence. The first lesson learnt in the Chino-Japanese war of 1895 was that for a country like China any attempt at policy without a trained force at its back is worse than useless. Yuan, as a soldier and a practical statesman, learnt this lesson well, and at once set to work to attempt a genuine and gradual reform in this direction. His position has, of course, been a difficult one. He had to raise the funds for his projects and has done it no doubt by the immemorial Chinese process of squeezing the helpless peasants. His extensive powers, not merely within his own viceroyalty, but throughout the provinces coming with the area of Northern Trade, have been fully used. His extortions have not, however, been as ignoble as those of most Chinese Viceroys, since they have been for useful public purposes and not for the heaping up of private wealth and the maintenance of a horde of parasites. Yuan has had throughout to maintain his position at court in the favors of a capricious and exacting mistress and against the intrigues of suspicious Manchus and jealous Chinese colleagues. Meanwhile events were happening at Pekin which strengthened his hands. The growing influence of Russia brought certain drawbacks in its train. The agencies employed, especially the Russo-

Chinese Bank and the diplomatic body, did not see eye to eye. The successful policy attributed to Russia and her Ambassador, Cassini—in reality the work of Pavloff (a master at the game of intrigue)—was overrated in America and Europe, being, in fact, chiefly remarkable because of the short-sighted stupidity displayed by the rival Powers and their chancelleries. Up to a certain point things worked smoothly for Russia, information was obtained superior to that of others, relations with the Imperial Court were placed upon an intimate footing, and the winning over of China's premier statesman to the view that Russia was the sole resource of the Celestial Empire was in itself a great diplomatic triumph. Dissensions between Russian agents, official and unofficial, were the first sign of weakness. Pokotiloff, head of the Russo-Chinese Bank, was at daggers-drawn with the Ambassador, Lessar. Their ranks were about equal; both placed a high value on their own services; neither would give way. While this was the state of affairs at Pekin there was no *entente* between Lessar and the officials at Port Arthur, while the latter again were divided into civil and military camps. This dissension was acute enough during the time that Grodekoff —a moderate and reasonable, tho not a popular, man—was in power, but when Alexieff, the incarnation of militarism—the "drill sergeant"—came into office affairs soon reached an acute stage, of which Russia is now realizing the disastrous results.

To return to Pekin. As Russian diplomacy fell to pieces—imperceptibly to the outer world—that of Japan increased in strength and solidarity. The task has been an uphill one, for China was sore from defeat and loath to accept friendship at the hands of her quondam despised enemy. In the middle of everything came the Boxer outbreak and the siege of the Legations, in which Japan was obliged to rank herself with Western Powers against China. Her scrupulous restraint and moderation, however, were so remarkable as to be commented on by the other Allied Powers, and did not escape the notice of the Chinese. Yuan Shi-kai discountenanced the Boxer movement and held aloof, which was the utmost he could do without sacrificing his prospects as a leader of the Chinese. When the trouble was over and the Empress Dowager returned to Pekin full of fair words for the foreigners, ardent for educational reform, bestowing favors on missionaries, and conferring posthumous honors on the reformers whom she had had put to death,—when, in short, she began to enact the *rôle* of penitent to the extreme edification of the world at large (and the private ridicule of her own subjects),—Yuan was bent on a practical move. Once more he had seen the inefficiency of Chinese methods, and now he had a freer hand in carrying out his own designs. All Chinese reformers by this time had turned unreservedly to Japan, and the many agencies set on foot by the Japanese, especially the newspapers in the vernacular, received an enormous stimulus from the fact that the Imperial Government had fallen hopelessly into disrepute. It had become obvious that Pekin was not to be looked to for salvation, and the successes in various directions of their neighbors, the Japanese, the sight of Japanese taking an equal place in the Allied Forces, was a lesson not to be overlooked. The Anglo-Japanese alliance came as another blow to Chinese pride, and further strengthened the position of Japan. As for the triumphs of diplomacy, it had already become apparent that the Japanese chancellerie at Pekin was supplied with the best information, and that the solidarity of aim, loyalty, and reserve of all the Japanese agents gave them advantages which the Russians had forfeited. Racial affinity and the similarity of the written language were strong handicaps in their favor, and it became increasingly evident during the last few years that Russia would no longer have a "walk-over" in the race for supremacy of influence at Pekin. Her foundations, however, are well laid, and she has obtained tangible advantages difficult to discount.

So far the growth of Japanese ascendency has been favorable to Great Britain, and, indirectly, to American interests. The Tsung-li-yamen, or, rather, the body which under another name has replaced it, is divided into two camps, the Russian and the British. The latter includes the Japanese, and is largely swayed by Japan. It has become rather the custom in the British and American

legations, especially since the Anglo-Japanese alliance, to rely on Japan for information, and it is undoubtedly through this source that much of the information which has led to momentous events in Central Asia has come. The history of Asiatic development in the past decade, when it can be written in true perspective, will afford the student of world affairs some interesting illustrations of the correlation of incidents which at the time of occurrence seem almost sporadic.

While it is convenient to have so reliable a source of intelligence as that afforded by a friendly Japan, it is, however, to be deprecated that the British or American Legations should allow themselves to fall into the habit of relying entirely upon it. The present British Minister at Pekin is not only a profound Japanese scholar, but is *persona grata* with the Japanese. Such a fortunate coincidence cannot always be arranged, and moreover, as I endeavored to point out in a previous article, Japan has her own game to play. While her policy at present runs on parallel lines to that of Britain and the United States, it is not inconceivable that, in details at least, there may be divergence of views which could be best adjusted by independent action, which must be founded on independent information.

If Japanese influence gained so rapidly during the period of apparent acquiescence in Russian methods, it must certainly have grown enormously during the few months which have lapsed since the opening of hostilities. Every fresh success of the Oriental David against the Northern Goliath is a blow to that prestige upon which Russia had founded so much of her success. Never again, whatever the result of the war, can she hypnotize China in the manner which won her huge and fertile territories with a long seaboard without the shedding of a drop of blood.

I am not one of those who believe that Japan has "pricked the Russian bubble,"—the expression "bubble" is altogether unsuitable to represent so great and expansive a Power as Russia. There are elements of force in the mighty, unwieldy Empire which cannot be gauged save by those who have seen with their own eyes. Nevertheless, Japan has demonstrated to the world, even at this early stage of the operations, that the Oriental nations have capacities with which they had not been credited, that they can combine the highest degree of efficiency and organization which the Western world has produced with a contempt for danger and death and a reserve and restraint which are essentially Oriental. No one who has had an opportunity of studying the two Oriental races—Chinese and Japanese—will deny that the former are to the full as capable, tho not perhaps as quick, as the latter. There are many points of character in which they are acknowledged to be superior. They lack the guiding principle of patriotism, but under Japanese tutelage they cannot fail to learn its meaning. No student of world politics can fail to perceive that a great era in history is just beginning in the emancipation of so vast a proportion of the world's population from the thralldom of age-long superstition. The interest with which we follow the dispatches from the seat of war will be redoubled if we realize all that Japan typifies in the cosmogony of the world to-day and her relation to that wonderful, unrealized mass of potentialities known as China.

Meanwhile Yuan Shi-kai drills his 50,000 troops on Japanese lines, manufactures arms, and waits for eventualities.

LONDON, ENGLAND.

Confessions of an Autographomaniac

BY THE MANIAC

I AM of humble but highly respectable parentage, and wish it understood that I hold no one responsible for the mania which possesses me. It was not inherited, nor caught as an infectious disease from some other maniac—it sprung up in a night, like a mushroom. I take the whole responsibility on my own not too broad shoulders. At times I might feel ashamed of myself were I not strengthened by the thought that this is the age of the survival of the fittest, and I am cerainly inclined to the belief that I am a fit person to reside in this "vale of tears," for only the fittest could survive what I have gone through. The patronizing airs, the sharp words and stony silences of many of the celebrities I have approached should constitute a proper test.

I am also convinced that, if not a man of iron, I am at least composed of some hard substance. Two and twenty was my age when I wrote for my first autograph, and a young man made of less sturdy material would have been squelched beyond possibility of rising by the reply I received. The books of a well-known author (he is still living, by the way, and I hope very happy) had given me genuine pleasure, and I thought it would be quite decorous to write and tell him so, and also to add a request for his autograph. Will you say that I am a weakling when I tell you I survived the answer? Here it is:

My Dear Sir: I have your letter of the 8th in which you frankly avow yourself an "autograph fiend," say my work has given you pleasure, and ask for a sample of my chirography. I presume that you are correct in your statement, but may I give you a little friendly advice so that this letter shall not be merely a sample of chirography? Your letter reads too much like a circular; you are not specific enough; you do not go into details; you do not compare the different characters of my novels and state your preferences. The next time you make such an application to an author it would be well to be more explicit, lest he think that you have only seen his name in a catalogue, and never have read any of his books. I observe, also, that your parents appear to have named you for the beloved disciple, but you write it "Jno." Suppose you should open your Bible to-morrow and read: "I, Jno., who am also your brother," etc. "Jno." spells nothing, and as an abbreviation is worth nothing, for by the time you have put in the period your pen has made as many motions as are required to write the full name. It is abominable and inexcusable. Write it no more.

I carefully filed the letter away—surely an interesting nucleus for my collection—and altho it unnerved me for a time, I was not compelled to take to my bed or call in the family physician. If I remember aright (it was many years ago) I wrote an impudent reply, but I am sorry for it now.

My manner is still rather unfortunate—I seem to lack humor and tact—but it must have been much more so in the first years of my collecting. It did not seem to inspire confidence. Every one, and especially the "rising young author" who had one or two novels to his credit, seemed suspicious and arrogant, and said enough hard things to kill a hypersensitive person. But, fortunately, such am not I! I remember writing what I deemed a clever and "fetching" application to an author of charming stories, who resided in a small Illinois town. Imagine my chagrin when I received a reply like this:

What is the ordinary autograph fiend—kind, amiable soul!— compared to the man who goes out and sets questions traps for autographs? The man, in short, who stirs up the animal's combativeness and sits grinning to see it perform. He shall bag nothing but initials from F. E. M.

I do not like to be accused of resorting to subterfuge, and this retort hurt me somewhat; but I assure the indulgent reader that F. E. M. did me a great injustice. I had no intention of deceiving her. I was as innocent as a lamb.

It is a terrible confession, but I have become about impervious to cutting words and shabby treatment. However, there is one thing that will lash me into

a fury and that is to be taken for a small boy. An antiquated maiden lady, of considerable fame, who affects a liking for children, answered me in this manner:

My Dear Young Friend: It always gives me pleasure to write my name for boys and girls, but I usually decline to comply with similar requests from grown-ups. You write a very good letter for a boy of—shall I say?—fourteen, and I am sure you do not idle away your time at school. Your mother must be proud of you. . . . I shall soon publish a new book, entitled "————," and I think you will like it. Perhaps your papa would be glad to buy it for you. Price, $1.50, net.

And I twenty-four years of age! The parsimonious old maid had an eye to business.

There are many celebrities, especially among authors, who ask the autographomaniac to do *things* in return for an autograph. A distinguished American historian replied to my request in the following words:

I was glad to receive your letter, for it gives me an opportunity to ask you to do something for me. If possible, I should like you to send me [I had written to him on the letter head of a lumber firm with which I was then connected] ten or a dozen photographs of scenes in lumber camps. By doing this you will greatly oblige, etc.

Very brief, but very explicit. No mention was made of postage, much less the cost of the photographs. Out of the generosity of my heart I complied with the historian's request, *and never received an acknowledgment!*

But it takes a woman to cap the climax. The writer of the letter given below is very well known in the literary world, and has at least thirty novels for which she will some day be called upon to answer:

My Dear Mr. ———: Be assured that I was very pleased indeed to receive your letter of the 15th, and I thank you very much for your kind words about my books. The mere name-seekers, who know nothing about one's work and care less, are past endurance. They should be thrust forth from the congregation of the righteous into outer and nethermost darkness; but autograph collectors who really know and care for an author's work should be tolerated by all means. Of course, I place you in the latter category. If I have given you pleasure, would you not also take pleasure in doing me a favor? My new novel will be upon the market in a few days, and I wish you would do all in your power to increase its sale. I am sending you by express a few hundred circulars, which kindly distribute carefully where they will do the most good. If you can, my dear Mr. ———, you might write your friends who live out of town recommending the book to them. If I have not sent you enough circulars, kindly advise me and I will forward more. Believe me, sincerely your friend, etc.

"Sincerely your friend"! How the words rang in my ears! I was pleased, for I was young. To be the "friend" of a well-known writer of novels seemed to me to be something of quite commanding proportions. I went to work in earnest. I distributed the circulars, sent for more, and wrote letters to all my friends telling them it was the greatest book of the year. I do not know whether or not this author is still "sincerely my friend." I hope so, for I certainly did enough to earn her lasting friendship. The sale of the novel referred to must have been increased something less than one thousand copies by my efforts.

The New England poets have always been favorites of mine, but I never suspected that they amounted to much as business men until I received the following response from one of them, written on the margin of a circular advertising three volumes of poems:

Here's my autograph
Writ as a favor to thee;
Now buy these three books
As a favor to me.

I bought them, of course. What else could I do?

One of our foremost novelists generously gave me his opinion of autograph collectors. I was delighted to receive the letter, for I did not expect more than a signature:

Dear Sir: You are one of those who trouble a busy person unnecessarily. I must say that, since there are dealers in autographs in all large cities who can supply specimens of writing at small cost, I believe it is much more considerate, not to say dignified, for collectors to deal with them directly. Letters are like questions, which one delights to answer if they show real interest, and hates if they are simply urged by curiosity. I am afraid that I must confess to a belief that your request for an autograph comes under the latter ignoble heading. Certainly the time taken up in asking for it and in replying on my part does not seem very well spent on either side; and I would remind you and others to think seriously what it

means to gather a collection of autographs. Go and sin no more.

It is seldom that one is willing to say he is glad that he is ignorant on matters he ought to know. But I'm very glad that I know little of postal laws. If I had known that it was illegal to inclose coin in a letter addressed to England I should not have received a delicious little letter which I prize highly. It is from one of the cleverest (and, I venture to say, most egotistical) of living English writers, who would, I doubt not, rather say a clever thing any day than a true one,—a gentleman whom, nevertheless, I greatly admire for his brilliant essays and charming novels. He reprimands me very sharply; but I appeal to you, how was I, an ignorant, irresponsible autographomaniac, to know that I was violating the English postal regulations by inclosing a ten-cent piece to pay the return postage? I had tried unsuccessfully to procure foreign stamps at the local post office and elsewhere, so was reduced to the necessity of inclosing coin, which I did innocently enough and without malice in my heart. Here is the letter:

DEAR SIR: I have your letter in which you give me a great deal of twaddle; and I beg to say that you are the worst fiend of all because your enclosure of coin might have subjected me to a heavy fee. It would be only justice if I sent it back to you instead of my signature. Your tribe is shameless and should be annihilated, but the task is too large for me to undertake. . . .

A great American humorist was making a prolonged stay in Europe when it occurred to me that a letter of his would do much to adorn my collection. I wished to be discreet and make no mistakes, so I took the precaution to write to a friend across the water asking him to send me some stamps that I might inclose the proper postage when sending my application to the distinguished humorist. This particular "funny man" is never happier than when he is pointing out the offenses and weaknesses of his fellow men; in short, he loves to have fun at the expense of other people. My ill-luck pursued me. It was another case of being "damned if you do and damned if you don't." I was amazed when the humorist rather made game of my considerateness in inclosing stamps, but I suspect (perhaps in this I am wrong) that it was nothing more than a peg upon which to hang his little joke on the American postmaster. The reply ran as follows:

Why, certainly; I do it with pleasure. You will find it at the bottom of this. But you did not need to enclose stamps. You only needed to tell me not to prepay this answer, but leave you to pay at your end of the line. In no part of the world do letters to foreign countries need to be prepaid. Perhaps some American postmasters know this, but in fifteen years I have not come across one that knew it.

The next letter is from the pen of a statesman, who is a very serious person indeed. He hasn't much sense of humor and cannot treat any subject with "playful fancy," unless it be fishing and fishermen. It was the fashion, twenty years ago, in certain circles, to ridicule this gentleman. He was not thought to be a very big man intellectually, and sportive persons of the opposite party delighted in cheap talk at his expense. But fair-minded men of all parties have now come to look upon him with respect and even admiration. His ability, independence of spirit, and devotion to duty as he sees it have won for him a high place in our political annals. In a quiet home he is now spending his last years as every gentleman and scholar should, a kind Providence permitting. I inadvertently omitted to inclose a stamped and addressed envelope, and I take this opportunity of extending an apology to the great man:

If you are an autograph fiend, you are a very mild and pleasant one. But I wish that particular kind of fiend would recognize the fact that, in their favor-asking business, the least they can do is to make compliance with their requests as easy as possible. . . .

It is balm to the soul of the autographomaniac when he can himself escape rebuke and at the same time call forth a little sermon on the wrongdoing of his brothers. As you may imagine, it is no easy thing to accomplish this feat of letters. It requires mental agility, subtle reasoning and elasticity of conscience such as an ignorant person like myself may command only once or twice in a lifetime. Therefore, it is with pardonable pride that I print the letter that is to follow. It is from a lady who is remarkable for her versatility and whose

charm is perennial. Her name is known to every reader in the land, young and old, for she has written for all of them. Pray consider how hard it was for me to restrain my "flattering tongue" in writing to her. But was not this delightful letter sufficient recompense? Unhappy thought! Did she intend, after all, to include me in her rebuke? The reader must judge:

My Dear Mr. ———: I should think that nothing would be so likely to obtain an autograph as an unaffected, courteous request. If I had time I could write you a rather interesting article on the subject. It is not a small one, and involves good breeding, knowledge of the world, and an intelligent perception of the singular and painful fact that there are only twenty-four hours in a day, and that a man or woman who writes books has the same sordid need of a few of them as a washerwoman or a bricklayer. One of the curious scientific discoveries future ages will make will be that books are not written while authors are lying on beds of roses, fanned by the wandering breezes of heaven. I am one of those who "resent profuse flattery." In the first place, it is an impertinence, as it argues that one is at once unused to hearing amiable things, and weak enough of mind to be immediately elated and spurred to lavishness by them. Then, also, letters containing it always recall to me those other leters beginning: "Madam, having heard of your charitable deeds and reputation for noble generosity, I take my pen in hand to ask you to . . . 'support my family,' to . . . 'buy me a piano,' to . . . 'pay my debts,'" etc. Thank you that your letter confined itself to a statement plain and frank enough to be accepted with a sense of pleasure. Appreciation which is real and simple one would be a poor thing not to value.

I had read a volume of pungent essays by an author well known on both sides of the Atlantic. Thought I, here is a man who will appreciate originality. If I approach him in an unconventional way he will do something handsome. Accordingly, I wrote him in effect that I could boast of sufficient grace to read and admire his writings; that I thought I deserved nothing short of immortality and that the blackness of my sin should not be remembered against me. I shall not again try to be original, for the reply was savage. I was not even given the dignity of sex, but was referred to as *it*.

Of course, the autographomaniac receives many business-like communications like the following, perfectly courteous but not overdiffuse in style: "Yours received. I am happy to inclose the desired autograph." But such acknowledgments do not give one that peculiarly pleasant thrill that accompanies the receipt of a "call down" or scathing denunciation. The maniac worthy of the name is not thin-skinned, and does not weep when he is told that he is a bore and a great nuisance. It is an interesting autograph he is after, and once he gets it the world may wag its cruel tongue until it is tired—little he cares!

Such distinguished collectors as Dr. G. Birkbeck Hill and Mr. Adrian Joline turn up their noses at my kind. For some reason best known to themselves they resent being placed in the same category as myself. But, bless their hearts! they are blind. They think their manner of riding a hobby is the only safe and proper way; but what are their pleasures and troubles compared with mine? They collect through dealers, and at the auction sales, spend heaps of money (which they carefully refrain from mentioning to their wives), and when they have secured the coveted autographs, what have they got? Dry-as-dust letters written for the most part by men long since gone to their fathers. With me and my brothers it is different. We choose a vulnerable point for attack, make a dashing charge, and usually come away with something alive —and a few scars! Keep your musty, dusty stuff, Mr. Joline and Dr. Hill; spend your money and get all the pleasure you can out of your hobby, but please do not put anything in the way of my collection by direct application.

"Shocking," you say. Perhaps; but I am willing to take the consequences.

Madison, Wisconsin

Literature

A Race Suicide Novel

"Whistling girls and crowing hens
Always come to some bad ends."

THIS poetical expression of the popular wisdom of the ages is not among the quotations which Mrs. Van Vorst has placed at the head of the chapters of her novel* against the New Woman, but it is an unfortunate omission, for it gives the theme of the book better than any of the texts she has chosen from Solomon, Paul, Roosevelt and other distinguished writers. After the manner of the old-time Sunday school books, which told how the boy who went fishing on the Sabbath fell into the river, Mrs. Van Vorst traces the lives of each of the members of a New York Woman's Club and shows how they all came to some bad end, except the two who repented of their evil ways in time. It was not one of those clubs where women become addicted to bridge and high-balls, but it was one where the women devote themselves to the much more dangerous practice of discussing the present position of their sex and the possibility of their larger participation in the affairs of the world. The evil effects of such studies on the lives of the members are explicitly shown in this novel; one of them commits suicide; one kills a man by an automobile which she refuses to stop in time; one becomes an invalid for life from a criminal operation; one ends in a sanitarium for chronic nervous prostration; one loses her only child, and one passes downward through a series of divorces. Only the heiress, who falls in love with a "mechanician" for his big, broad shoulders and blue eyes, and goes to live with him in a settlement, and the heroine, who repents, reforms and returns to her quiet home in the country, escape the nemesis of clubs.

The novel is in direct opposition to Mrs. Gilman's book on "The Home," but it is curious that both of the authors start from the same premise, that "the vice of our generation is individualism." Mrs. Van Vorst would remedy this by setting the solitary in families, but Mrs. Gilman looks for a larger synthesis. In wit and effective phrasing Mrs. Van Vorst is no match for her antagonist. *The Issues of Life* is written in the style which made *Peterson's Magazine* famous.

As a novel directed against race suicide this naturally challenges comparison with Zola's "Fecondité." It has nothing of the epic sweep and tremendous momentum of the latter book, but neither has it the grossness and dullness which characterize the work of Zola. The evil they attack is indeed one of the greatest of our modern civilization, but neither has given us much help as to remedies. The way to overcome is to go forward, not back; not back, as Mrs. Van Vorst virtually proposes, to the patriarchal family, when women were property and not allowed to think for themselves or to write novels; not back still further to a state of promiscuity such as Zola foresees.

* THE ISSUES OF LIFE. *A Novel of the American Woman of To-day. By Mrs. John Van Vorst.* New York: Doubleday, Page & Co. $1.50.

A Few Literary Problems

THERE is of course a certain consistency of spirit among these essays of Professor Beers', various as are their topics,* but for the sake of convenience they may be divided very roughly into two unequal portions—the one on the relation between literature and the university, the other on literary matters in general. The first, which is very significant at this particular time, includes two pieces, "College Entrance Requirements in English" and "Literature and the Colleges." The former was written originally in defense of a state of things at Yale which exists no longer—namely, the absence of an entrance examination in English; but in the course of his discussion Professor Beers relieves at least one fact which is

* POINTS AT ISSUE, AND SOME OTHER POINTS. *By Henry A. Beers.* New York: The Macmillan Co. $1.50.

still seasonable and suggestive. The student, he points out, knows English on coming to college—that is, he already reads, writes and speaks it with a degree of fluency and accuracy which would mark him a proficient in any other language—he uses it, in short, as an instrument of communication sufficiently well to answer all ordinary and some few extraordinary purposes. It is singular that this self-evident truth has so often escaped attention; but its statement falls across the whole problem like a ray of light, for it shows clearly enough that very much of the writing done in college at present is, in reality, either superfluous or impertinent—it attempts to do for the undergraduate only what has been done already, or else it attempts to push proficiency of expression beyond the point proper to a general education into the province of art or professionalism.

In the following essay Professor Beers calls attention to the fact that "the men who created an American literature during the first two generations of the nineteenth century were, nearly all of them, college bred;" whereas, "it needs but a glance at the names which have come to the front since the Civil War to assure us that this state of things has changed and that now just the reverse is true." For this rather disquieting transformation he attempts to account in several ways, chiefly by insisting that universities do not make literature. And in a sense the contention is quite true. But there is one thing that Professor Beers forgets; he forgets to compare the literature made by college graduates in the days when literature was their affair—the literature of Longfellow, Hawthorne, Emerson and Lowell—with that made nowadays. Is it not fair, one wonders, to infer that the superiority of the former is due to the training and discipline exerted upon the minds of its makers by a literary and academic education, which the colleges have since ceased to provide, while the inferiority of the present output is due very largely to the lack of such a training? If these colleges, instead of spending so much time in the perfunctory writing of English, would stiffen up their intellectual discipline a little, the effect upon literature might be very salutary. Of course, the university does not make literature, nor perhaps inspire it. But it should control and regulate it indirectly; it should form and rectify the taste of its students and of the public; it should serve as a kind of critical court or academy to the community at large, and it does in any case pretend to stimulate thought, which is the beginning of literature. Is it not, then, a question worthy of serious consideration whether the ill regulated and unchastened sense, the loose and vacuous thinking which are responsible for our present wretched literary vintage, is not the direct result of a general relaxation of academic standards?

Among the other topics which Professor Beers takes up, one of the most interesting is the "Modern Feeling for Nature." Every one, he says, who reads the older novel must have been struck by "the relatively large share which nature, as distinguished from man, holds in the imaginative literature of to-day." For this phenomenon he adduces several causes, principally "the increasing tameness of modern life" and "the rapid progress of the natural sciences" with "the closeness of scrutiny which they have made a habit of the modern mind." But at the same time that the feeling for nature has grown it has also undergone a decided change, and is now marked not only by a greater particularity, but also by a sense for the characteristic in preference to the beautiful and a sense for the sublime. The analysis is interesting and instructive, tho the conclusions, taken severally, are not particularly new. The idea of the "characteristic," for instance, belongs after a fashion to Friedrich Schlegel, who made it the criterion of all modern or "romantic" literature. At the same time there is another cause or concomitant of the change which we do not remember ever to have seen explicitly set forth; and that is the transformation which has taken place in the ideal of culture. What was chiefly valued in the older conception of culture was moral ideas. And this preoccupation with moral ideas caused the attention to be directed mainly to the study of man. Dryden and Pope were not insincere in their professions of respect for nature; but by nature they understood human nature almost exclusively. On the contrary, what we have come nowadays to

value especially is sentiment; the greater part of our present culture, outside of our more sinewy, scientific education, is as a matter of fact sentimental rather than moral. As a consequence a kind of vagueness and uncertainty has been introduced into our thought; temperament has been substituted for character as the mainspring of literature and art, and our attention has been drawn away from man, who is thoroughly a moral subject to nature, which is capable of inspiring just such hazy sentiments deprived of moral content as we delight in. As a further result of our lack of clear ideas and our preference for sentiment, literature has come to be suggestive rather than expressive. Having no very definite ideas to communicate, the writers are unable to say exactly what they do mean and are reduced to using dim and shadowy semblances, such as those with which nature itself affects the spirit.

Fox and Penn*

THE Society of Friends, or, as the world at large persists in calling them, Quakers, presents a phenomenon interesting alike to the students of ecclesiastical, social and constitutional history. As a body of Christians disdaining the bonds of creeds and sacraments, and the limitations of a hierarchy and liturgical forms, they have been characterized by a phase of religious life remarkable for its simplicity and power of suffering for the "truth's sake," as they understand the truth. As a body of individuals united in a common cause, they have been largely instrumental in securing the recognition of freedom of conscience and tolerance for religious scruples. The early Quakers were ahead of their generation in recognizing the equality of the sexes, and the whole body has ever labored in the cause of popular education and universal peace. As founders of a commonwealth they have furnished the world with a curious instance of political failure due, in part, to a sub-current of that intolerance which they deprecated, and, for the rest, to that scruple of "non-resistance" for which the world is not even yet prepared.

Materials for an investigation of these points and others of a kindred interest are to be found in the volumes to which this article refers. They are books of very different caliber and interest, *George Fox* being the statement of Fox himself, edited by a writer in evident sympathy with Quakerism, while *William Penn* is a study of the man by an author of wide experience in historical biography, and one who cannot at all times quench his native fire and sense of justice or resist the temptation to have a fling at the obstructive, obstinate and ungenerous spirit of the Quakers of newly settled Pennsylvania.

The Journal of George Fox, altho appreciated by men of catholic literary tastes, has never had any great attraction for persons outside the body which he founded. Written, toward the end of a life of persecution and suffering, by a man of, to say the best, but mediocre education in an age famous for its classicism, by one overpoweringly convinced of the divine origin of his mission to a world lying in utter darkness, it is not to be wondered at that it is the medley which some have found it. Dr. Jones has eliminated many of the features that militated against popularity, and has given us a connected narrative in Fox's own words, the spirit of which is but little affected by the curtailment. The result is a history of the early days of Quakerism which cannot fail to interest the general reader as well as the student, even tho they are not of Quaker proclivities.

In *William Penn* we have to deal with a very different story told in a very different way. Mr. Buell has brought to his study of Penn a keen appreciation of his personality, but without the glamour of sentiment. He has systematically built up the figure of the Founder of New Jersey and Pennsylvania from material carefully selected. The division into chapter periods is peculiarly suggestive and helpful to the reader. The style is lucid, sprightly, emphatic, and the volume is in every way worthy of its subject. The pith of the whole may be summed up in the concluding words: "Sometimes he (Penn) was a great statesman; at other

* GEORGE FOX: AN AUTOBIOGRAPHY. *Edited, with an Introduction and Notes, by Rufus M. Jones, M.A., Litt.D.* Philadelphia: Ferris & Leach. 2 vols. 1904. $4.00.

WILLIAM PENN, AS THE FOUNDER OF TWO COMMONWEALTHS. *By Augustus C. Buell.* New York: D. Appleton & Co. 1904. $2.25 net.

times a great Quaker; but he was never both at the same time."

Both works are well illustrated with portraits and scenes connected with the narratives.

The Story of Siena and San Gimignano. By Edmund G. Gardner. $1.75.

The Story of Seville. By Walter M. Gallichan and C. Gasquoine Hartley. New York: The Macmillan Co., $1.75.

Mr. Gardner's story of Siena, illustrated with the exquisite pen drawings of Miss Helen James, has reappeared in the Mediæval Town series. The transformation is a happy one, as in its former shape the book was too bulky for a traveler's modest kit. It is, moreover, admirably fitted for a place among the well written books of a series designed to delight the tourist by their convenient size, well arranged information and beautiful illustrations. Another valuable contribution to our knowledge of mediæval towns is Mr. Gallichan's "Story of Seville." He has succeeded in writing its history with a light touch which makes pleasant reading and yet has given us a fair idea of the rise, growth and character of the city as it passed from the control of Roman, Vandal, Goth and Moor. More space might have been given with advantage to an account of the Moors in Spain, as the most satisfactory page of her history is that which records the achievements of that humane, enlightened race; the darkest, perhaps, their expulsion. However, the author fully appreciates the Moors' benign influence on the arts and industries of a people whose only reputable occupations were fighting and praying, and he lightens the bloody annals of war and even the history of such a beast as Pedro the Cruel with bits of anecdotes and little taper-like gleams of humor. Mr. Gallichan has given color to his story of a town by adding to the description of cathedral and palace a picture of their lovely, flowery courts, and evoking for us the charm of a by-gone day, when the men who made Seville famous met for conversation in these same gardens. From this dream of old Seville the author leads us, without a shock, to the modern city, which is still quaint and beautiful. The three chapters devoted to the artists of Seville were written by Mrs. Gallichan, who has devoted much study to the art of Spain. She has shown much discrimination in judging of the comparative value of Flemish and Italian influence on Spanish art, and in her comparison of the genius of Velazquez and Murillo. Good sense being thus a characteristic of Mrs. Gallichan's criticism, one is not prepared to find so ambiguous a paragraph in her writing as this: "Nuñez appears to have been destitute of a sense of humor, and in a picture of St. Michael and St. Gabriel . . . he depicted the saints adorned with gayly colored peacock's wings." Certainly no one can convict the early Spanish artists of humor, but it is not clear to our mind why the adorning of Gabriel and Michael with peacock wings is an evidence of its lack. Pictures of angels with peacock wings are not unusual, nor are peacock wings more incongruous than other wings. Can it be possible that in these plumed saints Mrs. Gallichan has failed to recognize the great archangels? The beautiful drawings by Elizabeth Hartley greatly add to the charm of the book. After reading it we long to put it into our pocket, go to Seville and wander among its streets, gardens and museum with no other guide to darken its friendly counsels.

Cadets of Gascony. By Burton E. Stevenson. Philadelphia: J. B. Lippincott Company, $1 50.

There are two stories of old France in this volume by the author of *At Odds With the Regent;* the first a tale of adventures in the southern provinces, the second a narrative of the Parisian sewers. They are alike in having heroes who possess absolutely flawless courage, and the faculty of always coming out victor in the end, no matter how heavy the odds against them. The kind of hero who, when a beautiful unknown maiden rushes out of a doorway—any doorway—imploring his succor, will draw his sword and blindly follow her, kill half-a-dozen villains for her pleasure, and fall violently in love with her—all in the space of one short hour. With this type of hero you are not in the least worried when a chapter ends in words like these: " . . . a crushing blow fell upon my head. There was a burst of

flame before my eyes, my sword slipped from my hand, I felt myself falling, falling, and all was black." You know so well that he will bob up serenely in the next chapter, a trifle bruised, perhaps, but as dauntless as ever. The advantage of the autobiographical novel is that the hero's life is always insured.

Parsifal: The Guileless Fool. By Howard Duffield, the Minister of the Old First Presbyterian Church of New York. New York: Dodd, Mead & Co. $1 00

In this neatly printed book Dr. Duffield gives his impressions of this "stage-consecrating play," and an interesting discussion of its ethical teachings. The following quotation gives his position on this much discussed topic:

"It is a spectacle to command the Church's grateful and sympathetic approbation, to behold a mighty genius tasking his rare powers, and enlisting every resource of all the arts, to bear witness to the splendor and the sovereignty of the vital elements in the doctrine of the Christ, those very truths which the Church exists to publish. Such a unique product of mental power as 'Parsifal' is a mighty apologetic for Christianity, and its author an ally whose service the Church should gladly hail in the age-long effort to emancipate humanity from its woe, and to brighten this sad earth."

Humanism. By F. C. S. Schiller. Macmillan Co., $2.75.

The author of these essays, most of which have appeared in various periodicals, is already known through his "Personal Idealism." Here he is concerned to expound "Pragmatism," which may be defined as the purposiveness of our thought and the teleological character of its method. Like William James, the author holds that faith must underlie all reason; that "at bottom rationality itself is the supremest postulate of Faith." Humanism may be defined as philosophy without any non-human truths. "It takes man for granted as he stands, and the world of man's experience as it has come to seem to him." Like Reid, the author proposes to start from the standpoint of common sense and cast aside the trammels of abstract theory. His attitude resembles that of James, and he is even more vivacious in his style. His criticisms are sometimes of the "slashing" kind; but they are stimulating and show that metaphysical inquiry is renewing its vigor at Oxford.

The Faith of Men, and Other Stories. By Jack London. New York: The Macmillan Co. $1.50.

There are few of our young story writers who are not more or less consciously followers of Kipling, but Jack London is the only one who can really swing the master's style. "The Story of Jees Uck," found in this volume, is emphatically in Kipling's earlier manner in its biblical phraseology, its swift allusions, its lightly handled detail, its naked human nature, but we do not mean to say that Mr. London is an imitator in any objectional sense. Nobody but an original genius could have made the Alaskan girl, "who was not an Indian, nor an Eskimo, nor even an Innuit," so real and interesting to us without altogether idealizing her. There are some other stories of Alaska in the book. We expect to read them some time, but not until we have read "Jees Uck" two or three times more.

The Old Glade (Forbes's) Road and **The Waterways of Westward Expansion.** By Archer Butler Hulbert. Cleveland: The Arthur H. Clark Co.

These two works, comprising Volumes 5 and 9 of Mr. Hulbert's series, the Historic Highways of America, are of the same lucid and comprehensive quality as the previous volumes of the series. In *The Old Glade Road* Mr. Hulbert describes, with the fullest detail, the planning and execution in 1758 of a new road, following generally the trail of the prehistoric trading path, from Bedford, Pennsylvania, to the Ohio River. It was by means of this road that General Forbes, who succeeded General Braddock in command of the British forces in that region, was able to advance his army and supplies to Fort Duquesne, and in November, 1758, wrest the control of the Ohio from the French. General Forbes deliberated long before deciding on the route he finally chose. His judgment proved so unerring that when the Pennsylvania Railroad was first built the Old Glade Road was recognized as the shortest and

best line to Pittsburg it was possible to make, and that railroad was, accordingly, laid along the general alignment of the old pioneer road. *The Waterways of Westward Expansion* deals with the discovery of the Ohio River and its tributaries, and the importance of those streams in the settlement and development of Western Pennsylvania and the Middle West. The chapters, "The Evolution of River Craft" and "Three Generations of Rivermen" are especially interesting and give the clearest presentation of the gradual development of river traffic from the few rude flat-boats of pioneer times to the enormous traffic of present days.

Food and Cookery for the Sick and Convalescent. By Fannie Merritt Farmer. Boston: Little, Brown & Co. $1.50.

A practical manual of cooking for the sick needs no apology even in this day of making many books. Miss Farmer's experience as Principal of the Boston Cooking School has eminently fitted her to write a treatise on the subject, which we do not hesitate heartily to commend to professional and amateur nurses. The theoretical part is accurate and scientific, the recipes have been tested in hospitals and homes until their worth has been established, and attractive photographs scattered through the volume present the æsthetics of appetizing serving.

The Beginnings of Christianity. By Very Rev Thomas J. Shahan, S T.D., J.U.L. New York: Benzinger Brothers. $2.00.

This title might lead one to expect a history of the rise of Christianity to the opening of the second century or possibly covering the first three centuries, but actually the book is a collection of essays and addresses on topics connected with the history of Christianity in the first three centuries, and does not give a connected account of the events of early Church history. Among the subjects treated are, St. Paul, Teacher of the Nations; Slavery and Free Labor in Pagan Rome, The Origin of Christmas, Women in the Early Christian Communities, etc. Subjects of great interest in the history of the period, such as the development of dogma, the early forms of Church polity, are not discussed. Considered not as a history, but as a series of historical discourses, the volume is interesting from its fluency and eloquence and abundance of fact and incident, but it is history with a purpose and lacks impartiality. We would expect the Professor of Ecclesiastical History in the Catholic University at Washington to see in Gibbon something more than "an unbroken process of caricature" (p. 42), and a "compound of rhetorical minimism, exaggeration and distortion, every paragraph charged with infinite injustice" (p. 43).

Steps in the Expansion of Our Territory. By Oscar P. Austin. [Expansion of the Republic Series.] New York: D. Appleton & Co. $1.25 net.

Mr. Austin's book is an admirable narrative of the nation's growth from the War of Independence to the present time. Two introductory chapters relate the history of discovery and colonization. The book is especially valuable for the fullness and exactness of its data, while a succession of maps aids greatly in indicating, step by step, the growth of the national area and the transformation of Territories into States. There is no point of view to uphold, and no contentiousness is shown on controverted questions. It is a plainly told tale of what has happened in American expansion and how, and where it happened. No one need ask questions on this subject if he has this book at his elbow.

To Windward. By H. C. Rowland. New York: A. S. Barnes & Co.

Things nautical and things medical, with a large dose of things hospital and some Wall Street speculation, constitute the ingredients. The sea talk of the hero of the story is pure blackguardism, and when mixed with the slang of the "junior house surgeon" can better be imagined than described. There is no plot worth exhuming, and the obtrusion of the unveiled horrors of the operating table into the love affairs of the characters is repulsive. The placing of "cartilage knives" beside the plates at a dinner table, and the use of an "autopsy knife" to carve a duck, the author finds amusing.

Greater America. By Archibald R. Colquhoun. New York: Harper & Bros., $2.50.

The author ignores domestic politics and deals with problems of imperial importance affecting not merely the United States, but Greater America as a whole, the aim being to show to what point American evolution has progressed and to forecast the future. The assurance of the Panama Canal and the breaking out of the Russo-Japanese War change materially the factors of some of his conclusions—a vicissitude which any work as ephemeral as this can hardly avoid. None the less it is ably written, shows much keen and practiced observation and gives the reader a fairly clear appreciation of the new *rôle* of "world power" which some think only came to us with the close of the Spanish War.

Literary Notes

In view of the general discussion of the problems of marriage and divorce now engaging the attention of the American people, the appearance of a comprehensive work on the history of matrimonial institutions by so competent a historian as Prof. George Elliot Howard is of especial importance. It will be published by the University of Chicago.

....Mrs. Jeanette Robinson Murphy, who has made a study for many years of genuine negro music, especially of slave songs, will soon publish a volume of negro songs, which will also include dialect stories and some articles giving "Southern Thoughts for Northern Thinkers" (The Bandanna Publishing Company, New York).

....Among the many new books on the exploration of the great West, "The Trail of Lewis and Clark, 1804-1904," soon to be published by Putnam's, should prove of especial interest, since the author, Mr. Olin D. Wheeler, has for many years been familiar with the old and modern transcontinental routes. The work is to be in two volumes, well illustrated with maps and colored plates.

....In response to a request for an article for The Independent, Prof. Ernest Haeckel says that, since he has now entered upon the eighth decade of a life which has been full of activity, strife and the joy of labor, he feels the need of contemplative repose. To the 3,000 letters which he has received in regard to his little book on "The Riddle of the Universe," he finds it impossible to reply individually, but an answer to some of the questions which it elicited will be found in a sequel to that book which he has written during the past winter, spent on the Mediterranean, and which will be published in the fall under the title of "The Miracles of Life."

Pebbles

To-day.—"Has Mrs. Upperten many children?" "Yes—she has one."—*Puck.*

....The Japanese have won some important victories, but it will not do for them to get unduly puffed up. There is an imposing battery of ikons yet to be passed.—*The Indianapolis Journal.*

Oh, mother, may I go out to cull
Some milk-weed in these dishes
And then go down along the stream
And feed the small cat-fishes?
—*Yale Record.*

THE HAPPY SPRINGTIME.

Her face was happy,
His face was stern;
Her hand was in his'n,
His'n was in her'n.
—*Greenville Sun.*

...."They say the Japanese never kiss." "That's strange, isn't it?" "It seems to me so. And that reminds me that I wanted to ask you something, Mr. Swimmerton." "What is it, Miss Macy?" "I wanted to ask you if you had any Japanese blood in your veins."—*Cleveland Plain Dealer.*

Name Pictures.—What does Admiral Skrydloff's name remind you of? An editor says it reminds him of the noise made by a steam siren. A correspondent says it suggests to him a withered apple peeling. A plain citizen says it calls before him the efforts of a carpenter to force a big auger through a soft pine board. And the man who writes vaudeville sketches claims it suggests an infant devilfish bleating for its mother.—*Cleveland Plain Dealer.*

....The following reply to the question, "What is Art," is thus given by an art critic: "What shall I say? How convey to the *vulgus* that it is not in the nuances of the plastic that virtuosity inheres? That neither the quality of surface nor the tenderness of texture is all there is of symbolism? Nay, that the mysticism of tonal juxtaposition, the alternating *allegro* and *andante* of unchromatic color, the very contrasting masses of motif and technique themselves, neither singly nor in their sum compose even the half tone of feeling? The mere statement is rococo. And yet, alas! the renaissance of chiaroscuro is here the basic medium of the obvious. Can I hope, in fine, by posing an esoteric impressionism against the background of this Philistine atmosphere to give perspective to my conception of the sensuous manifestation of that synthesis of the ego and the non-ego which alone is Art?"—*Camera Work.*

Editorials

The End of the World Postponed

THERE have been two different methods employed in calculating the time to the end of the world: the Scriptural and the scientific. The former was based largely on the prophecy of Daniel, and the latter on the nebular hypothesis. Each method of calculation had its peculiar difficulties. It was not easy to determine which kingdoms were typified by the four beasts, and the historical anatomy of Nebuchadnezzar's image was never satisfactorily worked out. On the other hand, it was hard to calculate what must be the size, velocity and consistency of a semi-fluid sphere that it may throw off rings of the mass of the moon, and not enough was known of the interior of the earth to enable its rate of cooling to be determined with exactness. Just as the feet of Nebuchadnezzar's image were part of clay and part of iron, the specific gravity of the earth as a whole, which is intermediate between the specific gravities of these two substances, shows that its interior must be largely composed of material much heavier than its crust, and, therefore, probably metallic. It was found difficult to find the exact sum of the periods specified in the Bible, "a time and times and the half of a time," but it was equally impossible to add up in years the Paleozoic, Mesozoic and Cenozoic epochs.

The Scriptural method of foretelling the end of the world claimed the greater definiteness, and the date set by it was more imminent. More people put faith in Miller than in Kelvin—a faith which could be calculated by a monetary standard, since many gave away their farms and houses. Those sinners, however, who based their faith on astronomy, considered that a hundred million, or even ten million, years were sufficient for them to repent of their sins and dispose of their property. And now that by the discovery of radium this late and uncertain date is still further and indefinitely postponed, repentance and removal sales may be still rarer. A belief in the end of the world at the end of ten million years has never, indeed, had much influence on our conduct. Still it has to a certain extent tinged the background of our philosophy. Many a social reformer, discouraged by the slowness of any real progress in civilization, has questioned whether humanity would have time to reach the ideal state he longed for before its eclipse, and he has been disheartened by the thought that, even if this perfect condition should be attained, it could not be permanent, altho it might be many times longer than a literal millenium.

The light which the recent discoveries in radio-active matter seem to throw on the past history of our globe may be of great importance. Geologists and astronomical physicists have been for many years in a deadlock over the age of the earth. From the rate of radiation of the earth's internal heat, and on the assumption that it was once in a white hot liquid state, Lord Kelvin calculated that since the earth had been cool enough to form a crust not more than 40,000,000 years had elapsed and probably not more than 20,000,000, possibly less. Our own Clarence King, from his researches on the fusion temperature of the rocks forming the earth's crust, placed the period at 24,000,000. It was considered quite certain that the sun could not have been ready to support life on the earth much earlier than that.

On the other side the geologists, altho they did not commit themselves to such definite estimates, were a unit in demanding much longer periods of time. For the contraction necessary for mountain flexures, for the deposition of strata and their denudation, and for the evolution of plant and animal species hundreds of millions of years were thought necessary. From the composition of sea water, for example, it was calculated that at least 90,000,000 years must have passed since water began its solvent action on the

continents. It was a strong argument against evolution on the pure Darwinian principle of the slow accretion of advantageous variations, that paleontologists talked of the existence of the higher animals at a time when, according to the astronomers, the moon had not yet separated from the earth.

But all calculations of the heat of the earth and the sun were based, as Lord Kelvin was careful to state, on the proviso that no new and undiscovered sources of heat were considered. Professor Chamberlain, of the University of Chicago, in his calculations on the same subject especially mentions the possibility of unknown ultraatomic energy. Such ultraatomic energy has now apparently been discovered in many radio-active elements, and if the heat of the sun and of the earth is due in any considerable extent to such substances the age of the habitable earth may extend indefinitely in the past and future. The nebular hypothesis has been receiving some strong blows lately from Professor Chamberlain and others, and the introduction of this new element will make necessary a revision of the whole theory.

The cause of the sun's heat has been the subject of much speculation. Combustion was, of course, out of the question, not only on account of the conditions but because of its inadequacy. All the coal in the earth would supply the sun with fuel for only a tenth of a second. If the sun itself were a solid mass of coal it would have burnt out in 3000 years. Since the time of Helmholtz the theory has prevailed that the chief source of the sun's heat is the gravitational energy due to its contraction and solidification from a gaseous condition. A body on the surface of the sun in falling to the center would pass through a distance twice as great as if dropped from the moon to the earth, and would produce more than 3,000 times as much heat. It is calculated that an annual contraction of only 220 feet in the sun's diameter would account for all the heat produced.

In an address recently delivered M. C. E. Guillaume, adjunct director of the International Bureau of Weights and Measures, before the Astronomical Society of France, points out that, if to this gravitational energy we add the incalculable and possibly enormous amounts of heat produced by the emanations of such elements as radium and polonium, we have no reason to fear its cooling off within any conceivable time. The light gas helium was discovered in the sun before it was found in the earth, and, since this element appears to be one of the products of decomposition of radium, we have reason to believe that this also exists there. We must take into consideration, too, the possibility that at the high temperature of the sun, some 11,000 degrees Fahrenheit, many elements may be radio active which on the earth are inert. Professor Rutherford this week addressed at the Royal Institution a distinguished audience, including Lord Kelvin, Lord Rayleigh and Professor Dewar, on his researches in radio-activity, and offered this phenomenon as a possible explanation of the internal heat of the earth, instead of the older supposition that the earth yet retains in its interior some of the heat it possessed when in a molten state.

Clerical Utterances on Social Evils

A GENTLE Quaker lady had abandoned the theological beliefs of the Society of Friends, but clung to its forms of speech. An always welcome guest at her table was a well known reformer, whose name we must not repeat, but whose latest gospel was the Single Tax. No other guest could hope to wedge in a word where he was present, and could find listeners. One day at lunch the patience of his dearest friends began to fail. Realizing that a crisis had been reached, his hostess suddenly turned upon him, and in a voice of ineffable sweetness inquired, "W—— L——, why is thee such a fool?"

We are strongly tempted to put this lady's question to certain of our reverend reformers who just now are delivering themselves of strenuous doctrine on various social evils, and particularly "this social scourge of easy divorce."

Far be it from us to deride reformers. The world would be a sorry place without them. Their lot is not an easy one, and much should be forgiven them, even when they are most unwise and exas-

perating. Yet it sometimes becomes a public duty to remind them they do not always see how complex and tremendously difficult are the problems that they try to solve, and that sometimes their zeal is disproportionate to their knowledge.

Within the last fortnight stirring utterances on the alleged decay of domestic morality have been pronounced by ecclesiastical dignitaries and sensationally served up in the public prints. The Bishop of Long Island, if correctly reported, declared that "marriage has lost its sacredness in the eyes of the public," and he advised his clergy against marrying divorced persons, "even the innocent parties." At the One Hundred and Sixteenth General Assembly of the Presbyterian Church, the retiring Moderator said:

"Our ideals of the home have gone down. We talk of Mormonism, and affect a horror of it, as an unclean and loathsome thing; but as between a system that allows a man to have three or four ex-wives, or a woman to have three or four ex-husbands, and a system that permits a man to have his plural wives all at once, there is very little to choose. I am not sure but the odds are on the side of the Mormon."

These utterances undoubtedly reflect a determination in certain ecclesiastical circles to brand divorce as immoral, and to render it more difficult, by statutory means if possible, and at least by withholding "the religious sanction" from divorced persons wishing to remarry.

On the latter point we have nothing whatever to say. The first duty of all professors of religion, of whatever denomination, is to be sincere. If they believe that divorce is always inherently immoral and remarriage essentially "adulterous"—as the Presbyterian Moderator characterized it—let them by all means refuse to condone it or to dignify it in the name of religion. But when ecclesiastical influence is brought to bear upon the civil laws, in such cases made and provided, it is the duty of citizens who think that clerics like other men sometimes err in judgment, to point out their errors, and try to restrain them from doing mischief.

It is hard for us to believe that the distinguished gentlemen whom we have quoted have studied modern social conditions or the history of morals very profoundly. When the late Moderator of the Presbyterian General Assembly suggests that there is little to choose between Mormonism and divorce, he certainly fails to measure the gulf that separates these two systems. Mormonism is a reversion to patriarchal conceptions of social organization and the status of women. Mormonism implies the subordination and subjection of women to the will and ownership of man. Divorce, under modern conditions, is to some extent incidental to the liberation of women from centuries of subjection. It is in a degree correlated with profound changes of moral sentiment touching the right of woman to be a free individual, holding sacred in her own keeping her affections and her person.

Leaving out of consideration any comparison between divorce and Mormonism, which from the standpoint of social evolution is too absurd for serious consideration, there is no true comparison between divorce as a modern phenomenon of Western civilization and divorce as practiced under the Roman Empire—a comparison that prophets of gloom who think that we are travelling along the broad highway to destruction are fond of instituting. Roman divorce was practically at the will of the husband or the husband's family, as divorce in Oriental countries is to-day. It was not a procedure devised to safeguard the rights of women and children, no less than of men. If these rights are not impartially regarded by American courts to-day, the fault does not lie in the intent of the law.

Undoubtedly much divorce at the present time must be attributed to low ideals, instability of character, and uncontrolled sex-passion. This truth should not blind us to the further fact that many cases of divorce are attributable to high rather than to low conceptions of what the marriage relation should be.

But what does the Bishop of Long Island suppose would be gained denying the privilege of remarriage to an innocent party in divorce? Does he know so little of human nature as to suppose that the conduct of men will be made exemplary by vicariously punishing those that suffer through their wrong doing, or even by denying to anybody—good man or bad man—an opportunity to live decently in

a state of matrimony? Does the Bishop really wish to be ethically Hibernian to the extent of putting a legal premium on illegal cohabitation?

All in all, we are disposed to think that if our bishops and other clergy will look more deeply into this difficult problem, which they are proposing to solve in a cavalier fashion, they will find themselves admitting that, in the wise words of John Stuart Mill, "On all great questions much remains to be said."

Betrothals

THERE is also the zodiac of love, a radiant ecliptic in that heaven of the heart which corresponds in time at least to the path we know of through the twelve constellations. That is to say, there are seasons in sentiment, and the perfect courtship requires twelve months for fulfilment. It should not begin, therefore, prematurely beneath the enamoring light of a harvest moon, nor belated at a spring picnic. In such cases environment forces issues that have not sufficient conviction back of them. Love is not a growth, but an impulse, then, dependent upon the weather, the light, and a transient situation. It is a hurried instinct of kind, not a harmony of mind or spirit. It loses the wit and delicacy of a finer experience and becomes merely the emotional basis upon which people are drawn together and blindly united,—to discover later on that they have skipped the most thrilling and beautiful canto in the epic of life. They do not catch the whole of love's sweet measure before they start upon the long march together. They trip and lose step in the very beginning, often, because their brief courtship has only prepared them for the honeymoon dance.

Now, an ideal courtship should begin antipathetically. There is a shock of surprise too keen to be pleasant when two persons meet who are kin in heart to one another. We should always avoid courting those people who come easy to our understanding upon first acquaintance. The temperamental conditions of love are lacking. The man who cannot be ruffled by a woman's trivial action or speech during this first stage of personal recognition is not sufficiently vitalized by her personality to make an acceptable lover or husband. And the woman who is too nonchalantly ready to be agreeable will make a less attractive wife than the young vixen with a scratch cat's temper. For temper is the earliest chaotic confession of love. It is then a sort of violence that must be disciplined into tenderness. And this is a business that usually requires longer than a six weeks' courtship.

Besides, too much animation in the first stages of a love affair is injurious to the conclusion. It is graphic, but not symmetrical in development. This is bad form, romantically speaking. Therefore, the ideal courtship should begin during the summer months. The spring passion of the year is over. All the blossoms have been begotten, every lady tree, finished, passed the white bridal boughs of April into the matronly seclusion of ample foliage. There is a rest in the great opera of love and emotion. It is a season of natural peace which the whole creation recognizes in sensation if not in mind. Now is the season when women are full blown in beauty of gowns and sunshades, but most quiescent, indifferent in spirit. They display most because they mean least. They are ready to flirt, but not to love. The explanation is that this is the vacation term of life, nature's fair days when all are on exhibition merely. Everybody knows how easy it is to "make love" to a "summer girl," but it never is wise to trust one, because she is the creature of a fleeting situation. Her real personality is concealed, overswept, by a golfing frenzy, or the ambition of a hoyden huntress. If any man asks her in this mood to marry him, she will say "yes," for the same reason that she snares rabbits. She is out in the world to take, not to give. And if he lacks the wit to discover when a woman is not at home in her own heart he deserves to be made the victim of her trapping season.

Later, when she returns home, tanned, refreshed, and domestically bent upon taking up her own character again, if she receives him kindly, that is another matter. Out of the harvest of her heart he may win a red bound sheaf of smiles and count the autumn as the serious beginning of his courtship.

On the other hand, she will discover that the young business man in town is

not the same lover she had last summer on the beach. And she is a wise woman if she comprehends the significance of the change. A courtship is for several years after marriage the young wife's reference book for certain traits discovered in the husband. If he has been a lover long enough to include his commercial Ides with his romantic summer solstice, she will be prepared for his "brutal preoccupation" during the busy season. But if she meets him in June and marries him in September, she has tears to shed before she learns that his "fall opening" mood is not one of inhuman neglect, but it is the bond of title he gives her to prove that he has sufficient financial perseverance to support and endow a family.

But perhaps the most important part of a courtship is the winter time of snows and storms. It reveals to the enchanted pair a fire lit conception of love and domesticity. It makes the contrast complete between them and the cold world outside. It fills the heart of the woman with cosy hopes for the future and reconciles the wild creature, man, to a nuptial bondage that deprives him of many bachelor liberties. The "summer girl" may be withstood, because she is an illusion; but this queen woman of the hearth is real. She is vouched for in history and poetry. And she is irresistible, not because she is beautiful, or brilliant, but because she belongs to his order of things. He has inherited her from the homestead of the family past. And he is ready to woo her in earnest now with prayers and offerings. And the maid who had no more heart than a dryad during a summer flirtation is no longer a vacation ballad of femininity, but a woman potentially sweet made scriptural to him through love.

Such a pair of lovers have earned a springtime betrothal. The May world of bloom and promise belongs logically to their experience. They have passed into it as naturally as all the other mating things. And the earth, affianced anew to the sun, makes a great festival of beauty to celebrate the occasion. No wonder there are so many weddings in June! They are the orthodox confessions of winter courtships and spring betrothals.

The Retreat of the Western Union

THE retreat of the Western Union Telegraph Company deserves as much praise as its collusion with the race-track gamblers deserved of condemnation last week. In the fullest and completest way it has withdrawn its service from the race-tracks and the pool-rooms. Last week, in its initial action, it withdrew its service from the pool-rooms in this city; but that was utterly ineffectual, for it sent the news from its offices at the race-tracks to its out of town offices, and the reports were immediately telegraphed back to the fifteen or twenty centers in this city which distribute them by telephone to the cheap local pool-rooms. Of course, such action was a mere evasion of its duty and had no effect whatever and satisfied no moral demand.

Hardly a day after this perfunctory action had been taken President Clowry, on his own motion, with no action of the directors or of their Executive Committee, tho doubtless in consultation with the active members, issued a drastic order shutting off all service, of all sorts, from both the race-tracks and the pool-rooms all over the country. This was effective. The principal telephone company followed suit, and the police thereupon made such a general raid as has never been heard of before. Business was closed or was carried on in some places under the greatest difficulties. It is not easy to see just how this business will be resumed. Of course, it will be attempted, but with great difficulty, even if the police take off their hands again. The beauty of the old system was that under it no one could "beat" the regular pool-rooms by getting earlier news. The reports were sent absolutely simultaneously to all the fifteen or twenty racing exchanges, and even wire-tapping was of no particular use. Now that has, for the time, been accomplished for the whole country which we spoke of last week—the thousand heads united in a single neck cut off at a blow.

As we have said, the Western Union deserves the highest praise for this action. We wonder how many other companies would have been willing at a stroke to cut off business that must have

brought in about a million dollars a year. It was a large and profitable branch of business to the company, ruinous as it is for the country. We do not see how the race-tracks will stand it and continue to do business, for nearly all of them, apart from certain high purse races, depend for their support on the gamblers. Of course, they can do gambling business at the local race-tracks if the local police allow it, but the larger part of the patronage is gone until in some way recovered. The next question is, whether gambling on races, forbidden in pool-rooms, is to be allowed on the tracks.

All this shows the power of an appeal to the moral sense of the community, or of rich directors. They were personally held responsible. They were shown up to public condemnation as partners to felony. That they could not stand, and they yielded. It was much in the line of the social boycott recommended by President Hadley, and derided at the time, not to invite rich offenders to dinner. The appeal to the moral sense of these Western Union directors, and the assurance that the public would hold them personally guilty, was effectual.

But, praising them for their absolute retreat, we still observe the similar guilt of newspapers that have been quick to blame the Western Union for distributing news for gambling purposes, but which they distribute for the same purpose, filling columns and pages with "tips" and reports. Such conduct is pure hypocrisy. We wonder how many of them will so much as drop their "racing edition." Do columns of such news come under the rubric, "All the news that is fit to print"?

The Happy Papal Blunder

We wish that we could believe that so far from being a diplomatic blunder, to be retrieved if possible, the recent Papal protest against President Loubet's visit to Rome was a piece of far-seeing wisdom, meant to provoke the retaliatory action of the French Cabinet. For no greater blessing could come to the Catholic Church in France than the ending of the Concordat, followed by the absolute separation of Church and State in France.

That the Pope, however, sees this is more than we can believe. Such separation is one of the errors condemned in the famous "Syllabus of Errors." And yet Pius X has acknowledged that nowhere is the Church in a happier or more peaceful condition than in those countries, like England and America, where the Roman Church is free and independent, and where the Church depends wholly and comfortably on the support of the faithful.

It is now an imminent question of practical politics whether this divorce of Church and State in France shall take place. So much is the French Government provoked by the undiplomatic language of the Vatican that it has withdrawn its Ambassador at the Papal Court, M. Nisard. For the present absurd relations require two Ambassadors in Rome, one to the Quirinal and one to the Vatican, thus keeping up the fiction of Papal Sovereignty. Of course, this involves an utter inconsistency, for sovereignty cannot exist in two separate and antagonistic powers. The protest addressed by the Vatican to the various Governments contained a passage omitted in that addressed to France, but which has been published and has given great offense. These words were:

> "If, in spite of all, the Papal Nuncio remains in Paris, it is solely on account of grave motives of an altogether special character."

This language suggesting a possible withdrawal of the Papal Nuncio formed excuse enough for the withdrawal of the French Ambassador from the Vatican.

The difficulty may be patched up, but we hope not. Such an excellent opportunity may not soon occur again. And the French temper seems to make the ecclesiastical revolution possible. We most heartily hope that this occasion may be improved. We say this in no spirit of hostility to the Roman Catholic Church—quite the reverse; for we believe that nothing else could be so to the advantage, spiritual and ecclesiastical, of that Church in France. It would give it self-confidence and full liberty.

But the separation of the Church in France involves a very embarrassing problem, that of the duty of the State as to the restoration of the ecclesiastical funds confiscated by Napoleon, and on the basis of which the obligation was as-

sumed of giving subventions to the clergy. And such action would raise a similar question in England, which also ought to disestablish its National Church.

Philippine Good Will

It is a matter of the utmost importance for the future of the Philippines, and for the good will of the Filipinos toward us, that there should be a goodly number of Filipino boys educated in this country. One cannot exaggerate the value of the influence of the Chinese boys who, like the present Chinese Ambassador, were educated here and then returned to take important positions in their own country. It is very sad that our Sand Lot legislation has deprived us of this influence. Similarly the scores of Japanese young men educated here have proved of great value in succeeding years to their own land and to the esteem the Japanese have of this country. The three first Filipino young men came as students to Ann Arbor, in 1900, and two of them graduate this year as civil engineers. They knew no English, but had passed a competitive examination and were sent here at the expense of the International Club of Manila. They will graduate with honor and return to take important positions at home. Others have come at their own expense since, and have gone to the Jesuit school near San Francisco, and to the University of California, Yale, Harvard, Cornell and Columbian (Washington). And now a hundred young Filipinos, sent by the Government there, who have been in preparatory schools in California, will enter various colleges next fall. Fifty prominent Filipinos, Commissioners, Judges of Supreme Court, Governors of provinces, etc., will reach the United States in about a month to spend three months visiting the St. Louis Exposition and the cities of the country. They should receive every courteous attention.

After the question of Philippine independence has become a dead issue in the Islands, it is still discussed by a clique here at home. One of the principal addresses at the farewell banquet to Governor Taft at Manila answered their contention. The speaker, Salvador V. del Rosario, is a very prominent Filipino lawyer, who was decidedly against us in 1898-9, and even to 1901. His address testifies to the effect of the change from a military to a civil rule of the Islands:

"When one recalls the fact that for the price of $20,000,000, which was the consideration for the transfer of the rights of the Crown of Spain over these islands to the United States, the latter country inherited not only the dominion, but also the uncompromising hostility and implacable hatred which throughout the entire country was felt against all foreign authority, one can only be astonished in contemplating the immense distance traversed since that unhappy 'Fourth of February' down to these days of mutual confidence and reciprocal support."

He recognizes that this change is due to the discovery that the purpose of the United States, as declared by President McKinley and Governor Taft, is thoroughly benevolent, that its motto is "The Philippines for the Filipinos," and that it is radically opposed to the policy of Spain. He, therefore, calls for the utmost confidence in the United States Government. He adds:

"When I observe that the schools and colleges, the institutions of advanced and specialized learning, and even the religious institutions which are more prosperous to-day than during the *régime* of the State with an official religion, when I see all these halls of learning crowded daily with youths who are following the only road which, without suffering, without commotion, leads to the conquest of the highest rights, I ask my fellow countrymen if the United States can give us any greater freedom than to educate ourselves and to open without violence the doors of self-government.

"We, the weak people of the Orient, what have we to do with promises? Why should we insist that undertakings which we are unable to enforce should be entered into on our behalf? Instead of promises, we need the eloquence of facts, honest efforts which produce tangible and accomplished facts. Ever since the Philippines have existed as a geographical and political unity endless seductive promises have been whispered into our ears. . . . But it is only since the American era of our public life commenced that the development of our capacity has been inaugurated by giving us such a participation in the Government as was never dreamed of by the Power which previously controlled us . . . America has come without making great promises, but America is just, and we Filipinos may be sure that no single right of which we are yet unworthy will be granted us, and that no liberty justified by our own advance will be denied us. . . . The

witchcraft of our deep-rooted prejudice having been exorcised, there appears to be nothing on our part from which to fear any movement that may produce disorder. . . .

"For the profound and sincere moral pacification of the country, the work of a handful of American teachers, and the public schools now scattered through our towns and villages, as sanctuaries of the most sincere loyalty to the American Government, has been greater than that of 50,000 soldiers who carried into every corner of this Archipelago the power and authority of the United States."

Several Catholics have, in correspondence with us or in print, corrected our evident oversight by which, in an editorial on "Ecclesiastical Disturbances in the Philippines," our types made us refer to the five hundredth instead of the fiftieth anniversary of the proclamation of the dogma of the Immaculate Conception. One of these gentlemen, the Rev. J. M. Kirwin, rector of St. Mary's Cathedral, Galveston, Texas, tells us that the little pamphlet issued in the Philippines does not require Catholics to say: "I detest and reprove lay and purely scientific education." And he bids us "take the pamphlet to some competent Spanish instructor." We again quote from the pamphlet:

"I detest and reprove the secularization of education, and I say the civil authority cannot arrogate to itself the regulation and discipline of studies; and with the same energy I reprove and detest lay and purely scientific education" (*"repruebo y detesto la enseñanza láica y puremente cientifica."*).

Other passages, the translation of which we need not authenticate by giving the Spanish text, are:

"I detest and condemn civil marriage, which is pure concubinage."

"All the good of the State is born to it of its dependence and subordination to the Church."

"I detest and reprove popular sovereignty, universal suffrage and the system of majorities."

We cannot say that this pamphlet, handed out from all the convents, and offering, with the approval of Apostolic Delegate Guidi, generous indulgences to all that recite it tends to good will.

The explanation of a certain amount of ill will on the part of Americans in the Philippines has been thus explained by Secretary Taft. The American merchants who followed the army found their best market in supplying the 75,000 soldiers with wet and dry goods not supplied by the Government. These merchants took their tone from their customers, who, fighting the Filipinos, were not their friends, and did not believe in any system of peaceful self-government. Then the American newspapers were controlled in their policy by their soldier subscribers and their merchant advertisers. But the islands were pacified, and the 75,000 soldiers were reduced to 15,000, and the patronage of the merchants and newspapers fell off, and hard times came on them, as they had not tried to gain the favor of the permanent Philippine population. What they need to do is to mend their ways and try to please their natural customers, instead of insulting them, or merchants with more civilized and practical ideas of doing business might enter the field.

The Revival of the Debate

THE decadence of oratoric contests is sometimes attributed to a decadence of the power of oratory in general. Yet this can hardly be true, for the able debater in Congress still has his confidence; and on the platform argument is even a growing power. This is due to the fact, at least in part, that all over the country there is an increase of the independent voter in politics and the independent thinker in religious affairs. The decadence of oratorical contest in our schools and colleges is more wisely attributed to the immense strides made in the way of physical contest.

Any effort to revive scholastic debating we think should meet the heartiest approval, not only of educators, but of all good citizens. Professor Hartwell, of the Borough of Brooklyn, reports a movement to this effect in the secondary schools that is making rapid headway. In 1896 the progressive Polytechnic Institute took the initiative in organizing The Long Island Interscholastic Debating League. This League offered a silver cup to the school that would first win for three successive years. The experiment has been an eminent success, not only in awakening an interest in

public topics, but as a general intellectual awakening, that has affected the studies of the pupils in all departments.

Everything depends upon full co-operation between pupils and teachers—that is, the teachers must be as deeply interested in the subject under debate as the scholars themselves. The debate must not be a mere club affair, practically separated from the school curriculum. The questions must be living and practical, and they must be such as to prepare the participants for wiser citizenship. In the case which we have noted the preponderance has been for civic questions. Trial debates are first held before a committee of teachers. This committee judges the work of the debaters, and selects those that shall take part in public contests.

Since the general decline of the debate there has been more or less effort of a rather sporadic sort to sustain intercollegiate contests; but the audiences have been meager as compared with the crowds at a football game. Colleges which a few years ago were famous for forensic power became comparatively indifferent to these intellectual struggles. During the past two or three years there has been a decided and growing reaction, and colleges are keenly competing with each other.

We have not the slightest doublt that the revival of the debate will constitute a matter of distinctive progress in educational work. There is a mutter on all sides that our public school education is falling short in some directions where formerly it was most efficient. Is the element of competition too much left out; or is this competition too keenly biased toward physical contest? Professor Hartwell affirms that, after a careful study of the subject, he believes we can create and sustain the same zest in mental athletics as in physical.

In this age of machinery we must not allow a lapse of the art of expression. Human civilization not only arises in the formation of languages, but has been marked by increasing power in the fine art of language. Encouragement of one form of expression tends to promote other forms. Most of our ablest lawyers and preachers, looking backward, will credit their best stimulus and strongest momentum in the way of intellectual victories to some academic debating club. Fifty years ago these clubs, housed only in some wayside schoolhouse, afforded an opportunity to their members for the best possible training to apply knowledge, to be quick to think, ready to compare, and apt in the use of language. We believe that the revival of the debate, altho at present confined to a few head centers, can become national.

Advice to Nations South of Us

An opportunity for a little plain speaking about the attitude of the United States toward "all the nations south of us" was given to Mr. Roosevelt by the celebration of the second anniversary of Cuba's independence. He said:

> "All that we desire is to see all neighboring countries stable, orderly and prosperous. If a nation shows that it knows how to act with decency in industrial and political matters, if it keeps order and pays its obligations, then it need fear no interference from the United States. Brutal wrong doing, or an impotence which results in a general loosening of the ties of civilized society, may finally require intervention by some civilized nation, and in the Western Hemisphere the United States cannot ignore this duty."

The President was writing a brief letter. If he had set out to consider the subject comprehensively, he would have shown how unnecessary it is to ascribe to national greed or land hunger the interference or intervention suggested by the conditions that he mentions. It is for our own protection, and also because of our sympathy for the victims of injustice and oppression, that we are impelled to protest against chronic disorder, endless civil war and a shameless disregard for national pecuniary obligations, when such offenses are almost the only signs of life in the territory of a neighbor. Such evidences of barbarism irritate our own people, restrict commerce, imperil the lives and property of Americans engaged in international trade, and menace our relations with European Powers by inviting the forcible collection of foreign debts. Our power and our interests, national and international, have become so great that we cannot be expected now to endure patiently such irritation, loss and danger. Disorderly countries south of us will do well to be guided by the

friendly advice of Mr. Roosevelt, which is in accord with the recent remark of General Reyes that their national safety can best be promoted by encouraging the forces of civilization.

Party Quarrels and Blunders

A quarrel so bitter as that which now divides the Republican party in Wisconsin cannot fail to affect in some measure the vote for national candidates, altho the controversy is purely a local one. The State, in which the Republican plurality for the national ticket exceeded 100,000 in 1896 and 1900, is safe for Roosevelt, for the electors nominated are the same for both factions; but the plurality will probably be reduced and the party may suffer a loss in the House. Such conditions generally suggest trading at the polls. The opposition to Governor La Follette is not of sudden growth, but never before has it caused a formal division of the party or been powerful enough to gain for revolt the open and emphatic support of Senator Spooner, with whom now stand Senator Quarles and Congressman Babcock. The Governor has labored for reforms in party procedure and taxation, reforms that deserve the support of good men. There is some evidence, however, that he and his friends in striving to defend themselves against the hostility of corporations and of the older leaders, whom they superseded, have used arbitrary political methods that are not strictly just. This may give their opponents an advantage which they have not hitherto enjoyed. The controversy over the Governorship in Illinois is unfortunate, from the Republican point of view, because it exhibits dissension in a State where the two parties are more evenly balanced than in Wisconsin and where the national Republican leaders desire all the possible benefits of harmony. On the Democratic side an ugly quarrel between Tammany and the followers of ex-Senator Hill in the city of New York has a national aspect because it tends to prevent that acceptance of Judge Parker's candidacy by substantially all of the opponents of Hearst that was at one time expected. It seems impossible for the party at large to learn the old lesson that Tammany's political interests are always intensely local. Mr. Murphy's persistent preference for Mr. Cleveland could be explained by his careful regard for Tammany interests in the city and the State. It is true, however, that his recent action really tends to revive in distant places the movement for the ex-President. This quarrel in New York and Brooklyn is watched with much satisfaction by Governor Odell, who naturally rejoices over the division of his political foes, but does not realize how much his party may suffer by reason of his own extraordinary conduct in acting as chairman of the Republican Campaign Committee without resigning the office to which he was elected.

Kinetoscope Fakes

It has long been known that photographs could be taken in such a way as to give the falsest impressions, and now the art of manipulating moving picture apparatus for the same purpose is progressing more rapidly than any other branch of the fine arts. Recently a battle between the Russians and Japanese in the suburbs of Paris had to be stopped by the police and the different combatants brought before the court as the result of an attempt to procure a kinetoscope picture of a Manchurian battle to satisfy the spectators at vaudeville entertainments. A crowd of men from the slums of Paris had been dressed in Japanese and Russian uniforms and an engagement arranged before the camera, but the rage of the battle, altho artificially introduced, soon became too real, and the "soldiers" not finding sufficient satisfaction in blank cartridges clubbed their muskets and knocked each other on the head. American enterprise is not behind in this line of work, as is shown by the incident in Washington last week, where a camera set up on the Capitol grounds photographed a man with the dress and appearance of President Roosevelt in the act of walking arm in arm with a negro, offering him a cigar and obsequiously escorting him to his carriage. The films were confiscated by the New York police before being developed. Then the negro minstrel who got up the scheme denied that the Democratic Party had offered $4,000,000 for such a moving picture.

The Presbyterian Union

This week, we presume, the Presbyterian and the Cumberland Presbyterian General Assemblies will decide a larger question than has come before either body for many years, the question whether they will unite into a single Church by a process of racial separation. It is a most amazing case of ecclesiastical myopia that the large committees of the two denominations should have had their minds so fixed on the little near question of philosophy between them that they utterly failed to notice the vastly larger, but to them more distant, question of religion involved in a condition unanimously and airily accepted by them. But the Churches waked up to the subject, and the committee find that in the Presbyterian Church the question of free will and predestination does not bulk as large as that of Christian brotherhood. A number of presbyteries, including the great presbytery of Philadelphia, have voted to disapprove the plan of union on this ground. It is a great pity that so desirable a union should be prevented and the whole cause of union discredited by such a blunder of the wise men.

President Hyde's Platform

It is easy to make a party platform, but a national platform is another thing. It is "A National Platform on the Race Question" which President Hyde, of Bowdoin College, attempts to offer the country in *The Outlook*. We are not convinced that it will be accepted. The first article in the proposed platform is this:

"The differences between the races are deeper than the skin, and must find expression in the relations between the races."

True, for they reach some of the bones, but not the intellectual or moral powers. We know too many thousands of trained Chinese, Japanese, Hindus, Indians and negroes who, under the skin, are just like Caucasians to accept this article. The statement is contradicted by anthropology and common observation. The tint and taint of this premise discolor and distemper the whole platform, for it accepts race differentiations as a principle to control the treatment of the races. Here is part of another plank of the platform:

"Granting the suffrage to thriftless and illiterate negroes was the gigantic blunder of the North."

No more than granting of suffrage for generations to thriftless and illiterate white men had been. This is from another:

"Punishment of brutal crimes committed by members of one race against members of another race must be swift, sure and severe."

True, but so equally should other similar brutal crimes be punished. Read, "brutal crimes committed by one *person* against another." Again,

"Industrial opportunity must be open to the negro of trained and approved efficiency."

Of course; and to every other negro or white man as well. Once more:

"Northern philanthropy, in its aid to Southern education, must subordinate all abstract and sentimental considerations to that accurate knowledge and sympathetic appreciation of Southern conditions which are represented by the General Education Board."

Excellent; only we add, "and by those missionary societies which have had even a larger and more valuable experience in this field."

It is pretty clear that Mr. Cleveland desires the Democratic nomination, and it is not strange that he should. The honor of three terms of Presidency would be one which any man might covet. His letter emphatically denying any social intercourse with negroes, his lecture defending his action in the Chicago riot and his long article explaining his bond issue, are straws that indicate that he is "willing." His disavowal need not be too seriously taken.

The University of Chicago's Babylonian Expedition, under Dr. E. J. Banks, sends reports of good work well begun at Bismya. Tablets have been found of the very early date of Sargon I, generally supposed to have ruled about 3800 B. C., with others containing the name of his famous son Naram-Sin. Scarce anything could be more hopeful, for it is the earliest records that we most wish to find.

Insurance

A Noteworthy Case

THERE have been so many instances in which insurance companies have been defrauded that it seems worth while to mention one case in which this did not happen. The facts are as follows: A lawyer named Max Josephs, who lived in Brooklyn, N. Y., insured his life in favor of his wife with the Royal Arcanum and the Equitable Life Assurance Society, of this city. Some time after this had been accomplished the man disappeared, leaving no trace behind. Many thousands of dollars were spent by his family in the vain attempt to locate his whereabouts. A demand was at last made upon the assurers for the payment of the policies. Upon investigation covering a period of two years they finally became satisfied that Mr. Josephs was dead, and the insurance was thereupon paid. The incident seemed closed. Now comes the noteworthy feature of the case. About two months ago a letter was received from the missing husband by Mrs. Josephs, in which it appeared that Mr. Josephs was very much alive and was living in Melbourne, Australia. Immediately upon receipt of the letter in question arrangements were made with the Equitable and Royal Arcanum by the beneficiary to return the unused insurance money, together with full interest upon the entire amount. The matter was finally thus closed in a manner entirely satisfactory to all concerned. The incident will be a difficult one to combat by those who maintain that the world grows degenerate with the passing of time.

Masquerading Burglars

PROFESSIONAL thieves and burglars masquerading as house servants, posing as such and frequently impersonating domestics for longer or shorter periods in households that are carefully selected for the richness of the anticipated returns, are products of conditions existing in many modern establishments. Losses widely scattered but very considerable in the aggregate are constantly occurring which are easily accounted for when the newly engaged house servant and sundry easily negotiated articles of value disappear simultaneously. Such losses are a perpetual menace not only to householders but to burglary insurance companies as well.

Thieving in this form finds a wide field in which to operate and is being adopted more and more as a comparatively safe method to be used by daring women without scruple. As a result valuable trinkets, watches, jewelry and gems have frequently disappeared from insecure bureau drawers and other similar places where the owners have been accustomed to place them when they are not being worn. Wealthy suburbanites have been considerable sufferers from such thefts, which are particularly aggravating. The apprehension of thieves such as these is exceedingly difficult, and housewives cannot be overcareful in their selection of the house servants they must have. A new problem has been added to the domestic circle, which is to be looked for in the possibility that the "treasure of a girl" may turn out to be a masquerading burglar.

Restaurateurs' Liability

A RECENT decision in the Sherry case is an important one as fixing the liability of restaurant keepers for the carelessness of waiters. In the case cited the plaintiff was a woman who suffered a considerable damage to an expensive dress worn by her while sitting in Sherry's restaurant. The damage arose because of a waiter's carelessness. A verdict of $100 was rendered in favor of the plaintiff, which verdict was confirmed on appeal. Sherry will, in consequence, be obliged to pay the amount named, together with costs, that will doubtless be largely in excess of $100. The decision will impose enlarged responsibility upon landlords and restaurant men. Under the circumstances it is safe to say that more care will be required in future from the employees of hotel dining rooms.

JOHN H. WASHBURN, for so many years identified with The Home Insurance Company, and who recently resigned as President, was last week elected President of the National Board of Fire Underwriters.

Financial

Mexico's Railway Policy

THREE years ago, when control of the stock of the Mexican Central Railroad was acquired by an American syndicate, and projects for several extensions were undertaken, it was thought by some that control of the entire railway system of Mexico would soon be lodged in a few hands, by ownership or community of interest, and that the controlling interests might be associated with those of the Harriman and Gould systems, with whose lines the Mexican Central connects at or near the boundary. Some of the plans for extending the Mexican Central, however, were upset not long ago by the action of the Mexican Government, which stepped in and bought control of the Mexican National and its allied lines, under conditions which prevent the construction of competing roads within certain tracts of territory. Some anxiety has recently been manifested by persons representing the holders of $68,000,000 of Mexican Central bonds. On the 16th inst. the Mexican Minister of Finance made formal application to the Mexican Congress for authority to purchase the Vera Cruz & Pacific Railroad, and sought to explain the railroad policy of the Government in the following statement:

"The acquisition by the Federal Government the middle of last year of a little less than half of the shares of the National Railroad of Mexico, enabling it to exercise a controlling influence not only over that company, but also over the Interoceanic and Mexican International, has placed the Government in a position to intervene with greater authority than before in matters of general interest connected with the entire railway system of the nation.

"When it effected that operation the Government did not propose to take an active and direct share in the management and exploitation of the lines nor to restrict in any manner the freedom which the shareholders ought to enjoy to administer their properties in consonance with the general interests. The ends at which the Government aims are higher and more important, for, besides endeavoring to afford a solid guarantee for the supreme national interests that are bound up with the sovereignty of the State, it seeks to satisfy more efficaciously the requirements of commerce and industry through a sound policy in transportation questions and to harmonize as far as possible the interests of the various companies which, by their strife, for which there is often no solid reason, have at times impaired the financial credit of large enterprises established in the republic.

"In order to attain this object it has not been thought indispensable to acquire a pecuniary interest in other railway companies, seeing that the extent of the lines controlled by the nation enables the Government to exercise sufficient influence over the others."

That is to say, Mexico does not intend to buy all of the railroads, but only enough to give the Government control of all of them. There are only about 10,000 miles of road in the country. Those who are interested may take notice that the Government will not permit the roads to fall into the hands of any American syndicate. The enforcement of its policy may eventually subject the entire railway mileage to Government ownership and operation.

SPEYER & Co. and Harvey Fisk & Sons offer the new 5 per cent. gold bonds of Cuba at 97 and accrued interest. The subscription will be opened at their offices on the 26th inst.

....The Standard Oil Company declared a dividend of 8 per cent. last week, an increase of 1 per cent. over last year's dividend at the corresponding date. The entire dividend (on a capital of about $100,000,000) was 44 per cent. in 1903 and 45 per cent. in 1902.

....Not long after the Steel Corporation was formed, five brokerage houses in Pittsburg were carrying 280,000 shares of the stock, then having a market value of nearly $22,000,000. The same houses now have only 17,850 shares (7,350 of the preferred and 10,500 of the common), whose market value is less than $500,000. The original owners of the shares permitted the public to take nearly all of it at high prices.

....Dividends announced:

The Rubber Goods Mfg. Co., Preferred, 1¾ per cent., payable June 3d.

Survey of the World

Candidates for the Democratic Nomination

At the beginning of the present week 150 delegates instructed to vote for Judge Parker had been chosen in the Democratic conventions, together with 22 in Alabama, where instructions were not given, altho the convention adopted without dissent a resolution declaring that the Judge "is the most available and acceptable man of our party for the Presidency." If Porto Rico sends six delegates, there will be 1,000 votes in the national convention. It is now predicted that Judge Parker will have at least 400 votes on the first ballot. Probably Mr. Hearst will not have as many as 175, and he may not have more than 125. He has canceled his contract for 150 rooms in one of the large St. Louis hotels, retaining, however, 90 rooms in another. He has also reduced the number of his agents and other political employees. The assertion having been made in press dispatches that Indiana's instructed delegation was not enthusiastic in the support of Judge Parker, Mr. Taggart, the State's member of the National Committee, said in New York last week that Indiana had no second choice, that other Western States would follow her example, and that the nomination of Judge Parker was as certain as anything in politics could be. Indiana Democrats, he added, had ascertained that the Judge voted the regular ticket in 1896 and contributed to the campaign fund. They had also inquired as to his judicial opinions concerning Trusts and labor, and had found them satisfactory. Mr. Murphy, Tammany leader, has by no means ceased to oppose the nomination of Judge Parker, and in the publication of his opinions he has the aid of Mr. Hearst's newspapers. The immediate object of his attack, however, is Mr. August Belmont, prominently associated with ex-Senator Hill in the support of Parker, and representing the financial element of the party in New York City. Mr. Murphy permits the publication of a report of a conversation which is said to have taken place before the State convention, and in which he told Mr. Belmont that the Judge could not carry the State. When Mr. Belmont responded (this report says) that loyalty to the party required Murphy to support Parker, the Tammany leader reminded him that he had helped to elect McKinley and had publicly criticised his own brother for supporting the regular Democratic ticket. Mr. Belmont says there was no such conversation. Murphy gives to the press a letter from a friend in Alabama, who says that Belmont has sent to Democrats there letters asserting that all the New York City Democrats would support the Judge at St. Louis. His comment is that Belmont has "no right to speak for the New York City organization." He also causes to be published a letter from the South saying that the vote for Parker in the recent Alabama and Tennessee conventions was due to influence exerted by Mr. Belmont through the officers and the lobby of the Louisville & Nashville Railroad Company. Mr. Belmont replies in a conciliatory way, commending Murphy as a Tammany leader, and reminding him that in the New York convention Tammany offered a resolution praising Judge Parker in the warmest terms and sub-

mitting his name to the consideration of Democrats elsewhere. It is asserted that Murphy has agents in several Southern States striving to prevent the giving of instructions for Parker. It is understood that Tammany now intends to vote for Parker in obedience to the instructions, but will say to the convention that he cannot carry his State. Mr. Cleveland has given to the press a statement in which he says that he believes Parker will be nominated and that the Judge is now the logical candidate of the party. His original judgment was that Olney or Gray would be the strongest opponent of Roosevelt. He explains that his first statement in favor of Parker was given to the public because the conservative leaders were alarmed "over the strength this man Hearst was developing" and because he realized the necessity of checking the Hearst movement. Parker then seemed to him the "most likely man about whom the conservative element could concentrate its efforts to purge the party of that irrationalism with which it has been afflicted in the last two Presidential campaigns." Mr. Gorman emphatically denies the report that he recently advised his friends to vote for Parker because he himself had given up all hope of obtaining the nomination. In Nebraska, Mr. Bryan has easily defeated his opponents at the primaries on the issue of reaffirming the old platforms. In Omaha, where their strength was greatest, he carried every ward. He will be one of the delegates-at-large. At Dallas, Texas, last week, he spoke to an audience of 10,000 opposing the movement for Judge Parker and urging the Democrats of the State to be "true to their old ideals."

Other Political Topics

For a time, the movement in support of Speaker Cannon's nomination for the Vice-Presidency was checked by his own vigorous opposition and by the instructions of his State in favor of Mr. Hitt; but those who had preferred the Speaker are now turning to their original choice. Mr. Hitt, they say, would be an ideal candidate, but for his age. It is reported that Senator Fairbanks is now willing to be regarded as a candidate. In the State of New York, the Republicans are beginning to think of the nomination for the office of Governor. Senator Platt says that ex-Secretary Root ought to be chosen. It is understood that Mr. Root prefers to continue the practice of his profession. Governor Odell has others in mind. He sailed for Europe last week, and some think he will ask Ambassador Horace Porter, in Paris, to be a candidate.—It appears to be true that the intended election of Secretary Cortelyou to be chairman of the Republican National Committee is not approved by certain Senators and some other prominent Republicans, on account of his lack of experience in practical politics. It is said, however, that the President, by whom the Secretary was selected, is convinced that a better man for the place could not be obtained.—In Tennessee's Democratic convention, last week, the delegates were instructed for Parker. Because Alabama is first when the roll is called, the action of her convention was awaited with some curiosity. The delegates were not instructed, but they are for Parker, and a resolution declaring him to be the most available and acceptable candidate was adopted. Mr. Hearst's name was not mentioned during the proceedings. Mr. Gorman controlled the Maryland convention, and the delegates would have been instructed for him if he had not opposed such action. He named the delegates-at-large, omitting Governor Warfield, who sought to prevent the recent legislation for disfranchising negroes, and Senator-elect Rayner, with whom he is not in agreement. In the Ohio convention, the conservative element had a majority over the friends of Hearst and increased it by its decisions concerning contested seats. The platform committee refused to reaffirm the old national platforms. Instructions were not given, but the delegates are required to vote as a unit. This probably deprives Hearst of several delegates heretofore obtained by him in the districts. Mayor Tom L. Johnson let it be known that he desired the nomination of Mr. Folk, of St. Louis. —Senator Quay died, on the 28th ult., at his home in Beaver, Pa., of exhaustion, due to chronic gastritis. For

some time he had been failing, being unable to assimilate food. He was in his seventy-first year. It is said that the Governor will appoint in his place ex-Senator J. Donald Cameron, with whom the late Senator was in conference for several hours on the day before his death.

Acquittal of Tyner and Barrett

At the close of a trial that had consumed nineteen days, in Washington, on the 25th ult., James N. Tyner and Harrison J. Barrett were acquitted of the charge of conspiracy and bribery arising out of the action of the Post Office Department concerning certain speculative investment companies, sometimes called get-rich-quick syndicates. Mr. Tyner had been removed from the office of Assistant Attorney-General for the Department. Barrett, his nephew by marriage, had been for a time his assistant, but had withdrawn from the Department to act as counsel for the investment companies, which were continually in danger of having their business excluded from the mails. Mr. Tyner's case had excited much interest, owing to his connection with the public service for many years and to the fact that after his removal his wife had entered his room in the Department, accompanied by an expert locksmith, had opened the safe standing there, and had carried away papers which she found in it. He is 78 years old and quite feeble. During the trial he was brought to the court room in a chair, and his condition excited the sympathy of the spectators and the jury. When the verdict was announced, he wept, saying: "I am vindicated in the sight of man, and have made my peace with God. I can die happy now." Several of the jurors wept. There are no other indictments against Tyner, but several against Barrett are still to be considered. In his memorandum accompanying the Bristow report President Roosevelt said that "a condition of gross corruption" had been disclosed in Tyner's office, and that in the case of Tyner himself the misconduct revealed had "gone on for a number of years":

"The three chief offenders in the Government service were Tyner, Machen and Beavers. The friends of Tyner have advanced the theory that in his case the chief offender was really his nephew of marriage, Barrett, who was his assistant in the office for a part of the time, and that Tyner's offenses are due to his failing powers, bodily and mental. The facts set forth in Mr. Bristow's report do not tend to substantiate the validity of these excuses for Tyner, while they show literally astounding conduct in Barrett. . . . In the office of the Assistant Attorney-General for the Post Office Department under Tyner and Barrett . . . the criminals whom it was the sworn duty of these Government officials to prosecute paid them for permission to fleece the public unmolested."

Labor Questions

Owing to a decrease of freight traffic the railroad companies are reducing the number of employees. According to one estimate the number of those dismissed since April 15th, with those who are to go before June 10th, is about 75,000. No attempt to reduce wages has been reported. The Pennsylvania Railroad Company has closed its new Portage branch, an auxiliary line fifty miles long, constructed two years ago to relieve congestion on the main line in Western Pennsylvania. In Fall River the cotton manufacturers are planning to reduce wages by 10 per cent. Such a reduction was made there in November last.—The strike of the masters and pilots on the lakes is still in progress, altho a few captains have deserted the union and resumed work. A captain name Craine, who recently consented to take a steamer out from Buffalo, wrote a letter to the union expressing regret and penitence, saying that not until after leaving port had the realized what he was doing. The union fined him $3,000.—Freight traffic between New York and the ports of New England has been much affected by the strike of the steamship freight-handlers at the New York piers, but the company controlling the several steamship lines has been able to fill the strikers' places with green hands. Lawrence Curran, president of the union, was brought from Chicago to conduct the strike. He sought to extend it to all the New England ports touched by the boats, but in several cities the local unions would not obey his orders. The Teamsters' Union refused to strike in sympathy. A strike of the teamsters for

grievances of their own had just been averted by the efforts of the Civic Federation, and they had agreed to refrain for a year from participation in any sympathetic strike. The company declined to confer with Curran, asserting that the striking freight-handlers had violated an agreement signed by their union only two months ago. On the night of the 28th, a non-union man named Sokotoski, employed by the company, was attacked by five men and murdered while on his way home in Jersey City. One Griffin, a striker, is held for the crime, having been identified by persons who attempted to rescue Sokotoski. Owing to the effect of the strike upon the through train from Washington to Boston that is carried around the city of New York by water, the President made his journey to the school in Groton, Mass., by way of the Poughkeepsie bridge.—The Appellate Court of Illinois has decided, in a case relating to the violation of an injunction by strikers in Chicago, that the agreement for a "closed shop," which the union required the employing company to sign, would have been unlawful, in that it would have restricted the right of contract and discriminated in favor of one class of citizens to the exclusion of all others, thus violating the Constitutions of Illinois and of the United States. The Court also held that the action of the union in seeking to compel the execution of such an agreement constituted duress and criminal conspiracy. The sentences imposed by the lower court for contempt were confirmed.—Judge Smart, in Ottawa, Kan., last week denied the application of the Atchison Railroad Company for a permanent injunction against the striking machinists there, saying that no evidence of an intent to injure the company's property or interfere with non-union employees had been shown.

Philippine and Other Islands

After General Wood had set out to punish Datto Ali and his followers for their attack upon a detachment of the Seventeenth Infantry, near Lake Liguasan (in Mindanao), it became known that these hostile Moros, on the 12th ult., had killed 53 Filipino men, women and children, these being employees of the Government, with their families, at a camp near Malabang. They were surprised while asleep. General Wood reports that the Moros in that part of Mindanao, Ali and his band excepted, are peaceful.—The Honorary Commission of 41 Filipinos that is to make a tour of the States arrived at San Francisco last week. It includes Chief Justice Arellano and the three native members of the Philippine Commission.—In Hawaii, the opening to cultivation of land hitherto neglected has turned the attention of many to the management of small farms, and the production of bananas and pineapples for export. Pinapples of large size, from 30 to 50 pounds, are grown on poor soil. Canneries have been established, and export orders for three times their output have been received. A line of steamers is already employed exclusively for the shipment of bananas to the Pacific Coast States.—The authorities in Tutuila have begun a campaign against the mosquitoes in that island, believing that the prevalence of elephantiasis, a disease from which nearly half the natives suffer sooner or later, is due to these insects as agents of infection.—On the 26th inst., 600 young women, teachers in the schools of Porto Rico, will start for New York; 400 of them will receive instruction at Harvard, and 200 will go to Cornell. Each teacher gives one month's salary for the expenses of this visit, but nearly half of the cost, or about $30,000, remains to be met by contributions from the people of the States.—Subscriptions for the Cuban loan of $35,000,000, on the 26th ult., in New York, London, Frankfort and Amsterdam, amounted to more than $170,000,000, and the bonds have since been quoted at a substantial premium.

The Panama Canal

Counsel for the Anti-Boycott Association, which includes many contractors, has raised the question whether the present eight-hour law can be enforced with respect to labor on the Panama Canal, and whether the bill pending in Congress, to enlarge the scope of the present law would, if enacted, be applicable to canal contracts. Admiral Walker, president of the Commission, said that he would not attempt to forecast the Commission's action on decisions. He believed, however, that the construction

of the canal would be prevented if the Commission should be required to employ Americans only. He expected to obtain negro labor from the Southern States, but could not get enough of it. At the beginning, he thought, the greater part of the work would be done by negroes from Jamaica; afterward, Chinese coolies might be brought in. Not until all the plans are completed will the Commission decide whether it will do the work directly or let it out by contract. In one case the Commission would procure and employ the workmen; in the other they would be procured by the contractors. Admiral Walker expects that Congress will be asked to apply the eight-hour law to the canal zone, but he remarks that special legislation by Congress or the Commission would be required, because, in his opinion, the zone is not a part of the territory to which the present statute applies.—Assistant Surgeon Claude C. Pierce, of the Marine Hospital Service, has been appointed Health Officer of Panama City by the local authorities. This will insure the adoption of American methods for the defense of the zone against infection from abroad. After a stormy session, on the 28th ult., the project for establishing Panama's currency on a gold basis was defeated in the Legislature.

France and the Vatican

The action of Premier Combes in recalling M. Nisard, the French Ambassador to the Vatican, has been emphatically approved by the Chamber of Deputies by a vote of 427 to 95. This is the first time that the Government has received such general and enthusiastic support from all parties from the Conservative to the Socialist, so the maladroit note of Mgr. Merry del Val has resulted in strengthening the position of the chief enemies of ecclesiastical power. The demand of the radical Socialists for the revocation of the Concordat and the immediate withdrawal of all representation at the Vatican was rejected in compliance with the wishes of M. Combes, who stated, however, that several plans for the separation of Church and State were under consideration, and that the matter could be brought up after the passage of the budget next January. The position of the Cabinet is thus stated by the Premier:

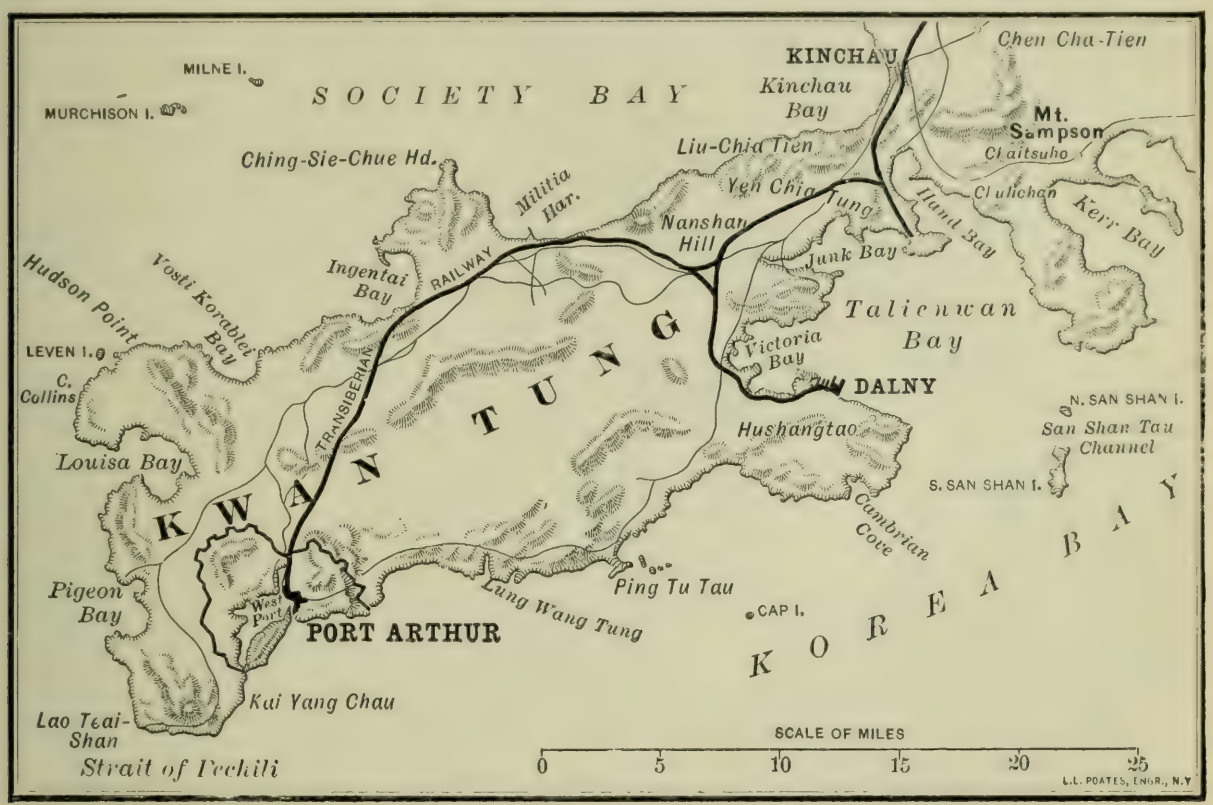
"We will not allow the Papacy to intermeddle in our international relations, and we intend to have done once for all with the superannuated fiction of temporal power, which disappeared thirty-four years ago. We will not withdraw the whole staff accredited to the Vatican, as we are bound by the Concordat to maintain at the Vatican an agent of our Government for carrying on business. Some speakers urge us to denounce the Concordat without delay, but such a serious step should be preceded by measures guaranteeing the republican State against the political risks which would be entailed by such a radical change in its legislation and habits."

The Committee on the Separation of Church and State has formulated a law providing for the abolition of the Concordat and the disposal of the Church property, which begins with the following words:

"The republic assures freedom of conscience and it guarantees the free exercise of religion without restriction, except for the preservation of public order. The republic will neither protect nor pay salaries nor subventions under any form whatever to any denomination. It will not recognize any minister of religion and will not furnish any building for the service of any denomination or for the lodging of any of its ministers."

The papal Nuncio at Paris, Mgr. Lorenzelli, has not been withdrawn, altho it is reported that he may be made a cardinal at a consistory to be held in July, and his post left vacant. The statement published in the official organ of the Vatican, the *Osservatore Romano*, asserts that Cardinal Merry del Val did not refuse to answer the question of M. Nisard as to whether the text of the papal note, as published in *Humanité*, was correct, but only postponed his reply for further consideration. In the Italian Chamber of Deputies the Republicans, Radicals and Socialists denounced the note to the Powers as an insult to Italy and her King. In reply Premier Giolitti said that the note had, of course, not been sent to the Italian Government, and that France had answered it as she thought best. Italy has no fear of the foreign congregations, as she has laws to protect herself, and if these are insufficient new ones can be made. The

State and Church must be as two parallel lines which never meet; both must enjoy liberty.



The Armenian Massacres

Further details of the massacre in Sassoon indicate that this may be as serious as the massacre at the same place in 1894, when 6,000 Armenians were butchered and 22 villages destroyed by order of Zekhi Pasha, the beginning of the series of outrages in which over 25,000 men, women and children perished and which resulted in the interference by European Powers and the United States for the relief and protection of the Armenians from Turkish cruelty. The promises of reforms in administration forced at that time from the Sultan have never been effectively carried out, and the present rebellion has ample justification. The Turkish forces operating against the Armenians consisted of 12,000 regulars and 16,000 Kurds, with 15 guns. It is reported that 43 villages have been burned and their inhabitants killed. The Christians took refuge in the mountains and Antranik, chief of the insurgents, collected a sufficient force to beat back the Turkish troops at several points with considerable loss. The Governor of Bitlis took with him the Armenian bishops of Bitlis and Mush in order that they might persuade the insurgents to lay down their arms. When the insurgent leaders came into the valley to parley with the bishops he ordered the troops to attack and surround them, but the ruse was in vain, for they escaped to the mountains. The Armenian leader, Antranik, is a carpenter and at one time worked at his trade in the construction of the Sultan's palace at Constantinople. His revolutionary career had begun before this, in 1890, when he took part in a revolt against the Mohammedan rulers of his people and was captured and imprisoned. In 1895 he went into Roumania and the Caucasus, and engaged in the transportation of arms to the insurgents. Since then he has been connected with various bands of revolutionists, and, on the death of Serop, he was chosen chief of his band. In the winter of 1901 he captured the convent of Suparabelatz and escaped with difficulty through the lines of the Turkish troops besieging it. He claims that he and his band are not rebels, but only defending their lives and those of their compatriots against the Kurds; that they have never sacked villages or attacked innocent persons, but have only executed those who were most guilty of the outrages on the inhabitants of the valleys of Mush and Sassoon; that they recognize the authority of the Sultan, but one Sultan is enough for them, they do not wish every Kurdish chief to dispose of the lives and goods of the Armenians at his will, and that they are ready to surrender if they are guaranteed safety for themselves and their fellow countrymen.

The Battle of Nan-Shan Hill

By one of the fiercest attacks of modern times the Japanese on May 26th captured Kin-chau and the hights beyond. The position selected by General Stoessel for checking their advance to Port Arthur was the narrowest part of the Kwan-Tung peninsula, just south of Kin-chau, and the fortifications were skillfully constructed, extending from Talienwan Bay on the right to Nan-Shan Hill, near Kin-chau Bay, on the left. The base of the hill was protected by very strong wire entanglements and the approaches mined. On the sides were numerous rifle pits and on the crest were batteries containing altogether some 70 pieces of artillery ranging in size from 9 to 15 centimeters caliber. The hights on the Russian right at Talienwan were also strongly fortified and provided with searchlights, while a gunboat, probably the "Bobr," was so placed on the bay as to protect the Russian front by a cross-fire. The Japanese began operations on the 22d by drawing the fire from all the Russian batteries, collecting the fragments of the shells and measuring them, so that by the morning of the 26th they knew with considerable exactness the location and strength of all the guns. It was decided that the most vulnerable point was on the Russian left at Nan-Shan Hill, for this could be outflanked on the west, and here the support of the fleet in Kin-chau Bay could be secured. The first Japanese position, on the hills east of Kin-chau was in the form of a right angle; the left wing fronting south on Talienwan and the right west toward Kin-chau. Upon the right wing, com-

posed of the Fourth Division of the Osaka men, devolved the most important movement, which was to swing south into line, occupying the town of Kin-chau and charging the hill of Nan-Shan. It had been planned to begin the fire at 4.30 in the morning, but a heavy thunderstorm in the night and fog at daybreak delayed matters, and it was an hour later when a detachment seized Kin-chau castle, and the infantry advanced all along the line under protection of the artillery. The Russian guns opened effective fire

Map of the Kwan Tung Peninsula

at a range of two miles, and continued actively for three hours. By 11 o'clock the Japanese had worked their way to within about 400 yeards of the Russian lines, and all the rest of the day was spent in desperate charges up the hights, alternating with artillery fire. The wire entanglements were successfully cleared away, and, by a lucky chance, the wires leading to the mines were discovered and cut before the Russians could make use of them. The fire from the machine guns and rifles was so murderous that in several charges of 200 yards from their last shelter every officer and man was killed before they came within 20 yards of the Russian line. No impression could be made on the Russian right and center, which, reinforced by fresh troops and artillery from Dalny, poured an enfilading fire across the Japanese line toward the westward. During the afternoon the Japanese lost 3,500 men, killed and wounded, but there was no shrinking when new charges were called for. Toward night General Oku found that the Japanese ammunition was nearly exhausted, and since to withdraw under the circumstances would be practically to admit a defeat, he ordered the artillery to use it in a final fire, and the infantry to charge all along the line. The Japanese were again repulsed everywhere, except on the Russian left, which had suffered from the continued firing of the four gunboats in Kin-chau Bay. Here the Japanese assault on Nan-Shan Hill reached the intrenchments, and, after a bloody hand-to-hand fight with bayonets, the Russians were driven backward at 7.30 o'clock. They retired toward Port Arthur, exploding their magazines as they left. The Japanese pursued them closely and occupied the town of Talienwan, thus severing the railroad connection of Dalny with Port Arthur. Over 500 Russian dead were found in the trenches and their total loss is unknown. The Japanese captured 68 large guns and 10 machine guns, besides stores and ammunition. Dalny was occupied on May

30th without opposition. The warehouses and barracks were found uninjured as well as all the dock piers, except the largest.

Morocco The demands of the bandits who kidnapped Ion Perdicaris, an American, and Cromwell Varley, a British subject, are such that they cannot be accepted, and in consequence the lives of the captives are in great danger. Raisuli threatens to put them to death unless the Moroccan troops are withdrawn, a heavy ransom collected from the governors of Tangier and Fez and a guaranty of absolute immunity for himself and his band from pursuit and punishment for this and all other crimes they have committed. The impossible part of the proposition is that he insists that the United States and Great Britain shall guarantee the observance of these conditions on the part of the Moorish Government. Secretary Hay and the President have agreed that it would be impossible for this country to insure that the Sultan of Morocco should not take any action against a brigand who is practically in rebellion against him. Admiral Chadwick in the "Brooklyn" went to Tangier followed by the rest of the European squadron from the Azores. By the recent Anglo-French colonial treaty France has the privilege of interfering with the internal affairs of Morocco, and will doubtless take some action in this case of brigandage. The troops have received little pay for a long time and at Ujda, near the Algerian frontier, the Moorish commander was obliged to disarm the soldiers to prevent their selling the rifles and cartridges to the rebels to obtain food. The expeditions, which used to be sent to the southern provinces occasionally for the double purpose of suppressing rebellion and collecting the taxes, have of late not dared to proceed more than two days' march from Fez. The Sultan conceived a plan for raising funds by having a large amount of depreciated money coined, which the Government paid out at its face value, but received only at its bullion value. This caused serious riots at Marakesh, the southern capital, in which the Jew and Christian quarters were mobbed. The Government had to cease the issue of the debased coin and the Sultan is not able to pay the $500,000 which he owes the mint for its coinage.

Our Commerce with Abyssinia Mr. Robert R. Skinner, who was sent on a special mission to Abyssinia in November, reports highly satisfactory results. A region containing over ten million inhabitants has been opened up to trade, and friendly relations have been cemented by the trade treaty with King Menelik II. If the treaty negotiated is ratified by the Senate, the United States will be placed in a favorable position to trade with Abyssinia without hampering restrictions. The invitation to take part in the Louisiana Purchase Exposition was accepted, and arrangements for an exhibit have been made. For the Agricultural Department a collection of rare seeds was made by Mr. Skinner. The experiments with wild coffee berries will be watched with interest, as the experts believe the degeneration of modern plantations is due to the continued use of seed from Arabia, and that by getting back to the wild coffee plant a new variety may be created. King Menelik received the embassy cordially.

"Probably for the first time in the modern history of Ethiopia has a foreign mission visited the country upon an errand of peace and amity, bringing no vexed question of territorial integrity or national honor to decide, and neither asking nor granting anything to which both sides could not accede."

At the present time merchandise entering Abyssinia pays an import duty of 10 per cent. If imported by way of Djibouti it crosses the French colony without any supplementary charges except the port taxes, which are moderate. The British route from Zeilah or Berbera is also free. Agricultural implements are much needed, and America should supply the lack. Few European merchants have lost money in Abyssinia. The total commerce of the empire is estimated at $3,000,000 per annum. The greater use of the railroad connecting with the sea, resisted at first by conservatism, will increase these figures. Cotton tissues lead the list of imports; coffee is the most important export. Under the treaty our trade should increase considerably during the coming year.

Menelik, King of Abyssinia, Awaiting the Arrival of U. S. Commissioner Skinner, in the Aderach, or Imperial Parlor.

Summer Shooting

BY GROVER CLEVELAND

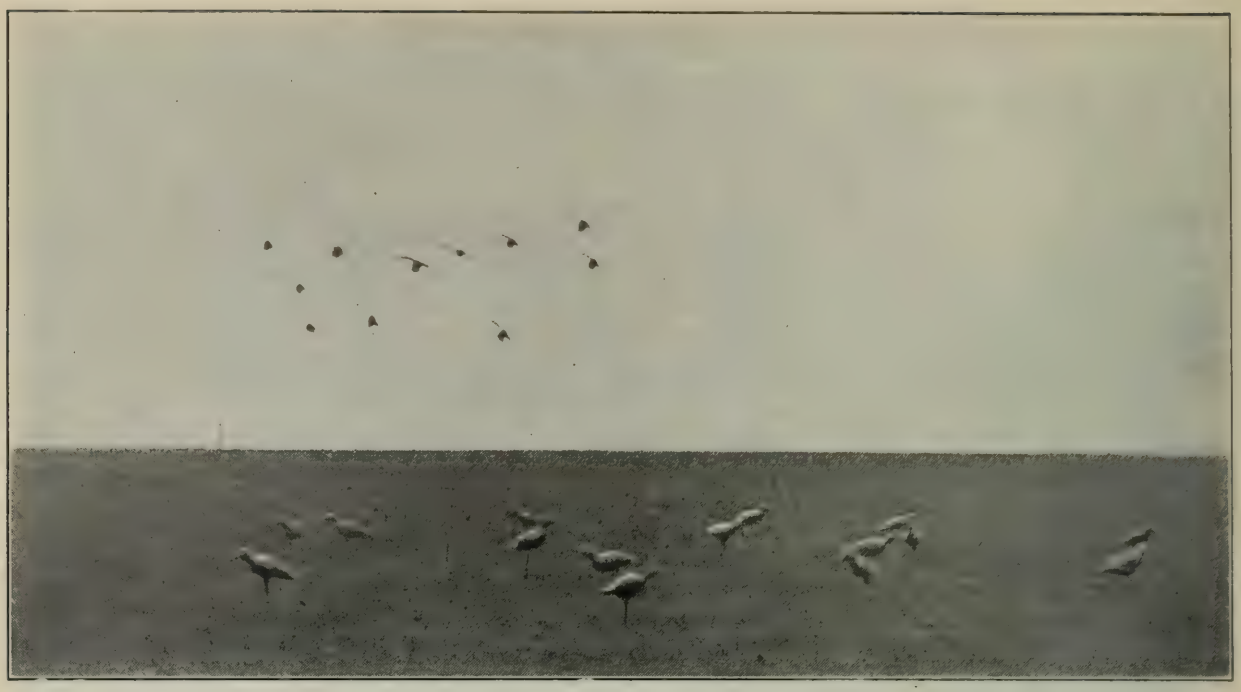
Ex-President of the United States

AS a general rule our guns should be put away for a long rest before the days of summer vacation. There is, however, one game situation which justifies their use, and it is this situation which sometimes appropriately allows a small gauge gun to be placed beside the rod and reel in making up a vacation outfit.

GROVER CLEVELAND

In July or August the summer migration from their breeding places in the far North brings shore birds and plover —both old and full grown young—along our Eastern coast, in first-rate condition. My experience in shooting this game has all been within recent years, and almost entirely in the marshes and along the shores of Cape Cod. Like other members of the present generation and later comers in a limited field, I have been obliged to hear with tiresome iteration the old, old story of gray haired men who tell of the arms and the man who in days gone by, on this identical ground, have slain these birds by thousands. The embellishment of these tales by all the incidents that mark the progress of our people in game extermination I have accepted as furnishing an explanation of the meager success of many of my excursions; but at the same time my condemnation of the methods of the inconsiderate slaughterers who preceded me has led to a consoling consciousness of my own superior sporting virtues.

While I am willing to confess to con-



Shore Bird Shooting

siderable resentment against those who in their shooting days were thoughtless enough to forget that I was to come after them, it must by no means be understood that my gunning for shore birds has been discouraging. I have made some fair bags, and any bag is large enough for me, providing I have lost no opportunities and have shot well. Besides, I have never indulged in any shooting so conducive to the stimulation and strengthening of the incomparable virtue of patience. I have sat in a blind for five hours, by the watch —and awake nearly all the time at that— without seeing or hearing a bird worth shooting.

It is, however, neither the killing of birds nor the cultivation of patience that has exacted my absolute submission to the fascination of shore bird shooting on Cape Cod. It is hard to explain this fascination, but my notion is that it grows out of a conceited attempt to calculate the direction of the wind and other weather conditions over-night, the elaborate preparations for a daylight start, the uncertainties of the pursuit under any conditions, the hope, amounting almost to expectation, that notwithstanding this the wisdom and calculation expended in determining upon the trip will be vindicated, the delightful early morning drive to the grounds, the anticipation of a flight of birds every moment while there, and the final sustaining expectation of their arrival in any event just before night. The singular thing in my case is that if all goes wrong at last, and even if under the influence of fatigue and disappointment I resolve during the drive home in chill and darkness that the trip will not be repeated for many a long day, it is quite certain that within forty-eight hours I shall be again observing the weather and guessing what the direction of the wind will be the next morning, in contemplation of another start.

But some will say, how are the incidents of hope and expectation, or of preparation and calculation, which are common to all sporting excursions, made to account for this especial infatuation with shore bird shooting? I shall answer this question as well as I can by suggesting that the difference is one of degree. In gunning for other game one knows, or thinks he knows, where it is or ought to be. The wind and weather, while not entirely ignored, usually have a subordinate place in preliminary calculation, and the pleasures of hope and expectation are kept within the limits of ability or luck in finding the game. On the other hand, the shore bird hunter knows not the abiding place of his game. He knows that at some times during certain summer

The Grayback Snipe Decoy Beautifully
From "Country Life in America." Copyright, 1903, by Doubleday, Page & Company

months these birds pass southward in their long migration, but he cannot know whether they will keep far out at sea or will on some unknown day be driven by wind and weather to the shore for temporary rest and feeding, and thus give him his opportunity. Tho the presence on marsh or shore of a few bird stragglers may put him on his guard, it must still remain a question whether the game in sufficient quantities to make good shooting is hundreds or thousands of miles away or in the neighborhood of the shooting grounds.

I believe the unusual contingencies of shore bird shooting and the wider scope they give for hope and expectation, together with the manifold conditions

Flood Tide on the Marsh
From "Country Life in America." Copyright, 1903, by Doubleday, Page & Company

which give abundant opportunity for self-conceit in calculating probabilities, account for its quality of exceptional fascination.

The sportsman who persists is apt occasionally to find a good number of birds about the grounds; and when that happens, if he is adequately equipped with good decoys, and the right spirit, and especially if he is able to call the birds, he will enjoy a variety of fine shooting. The initiated well understand the importance of the call, and they know that the best caller will get the most birds. The notes of shore birds, tho quite dissimilar, are in most cases easily imitated after a little practice, and a simply constructed contrivance which can be purchased at almost any sporting goods store will answer for all the game if properly used. The birds are usually heard before they are seen, and if their notes are answered naturally and not too vehemently or too often, they will soon be seen within shooting range, whether they are Black Breasted Plover, Chicken Plover, Yellow Legs, Piping Plover, Curlew, Sanderlings or Grass birds. Of course, no decent hunter allows them to alight before he shoots.

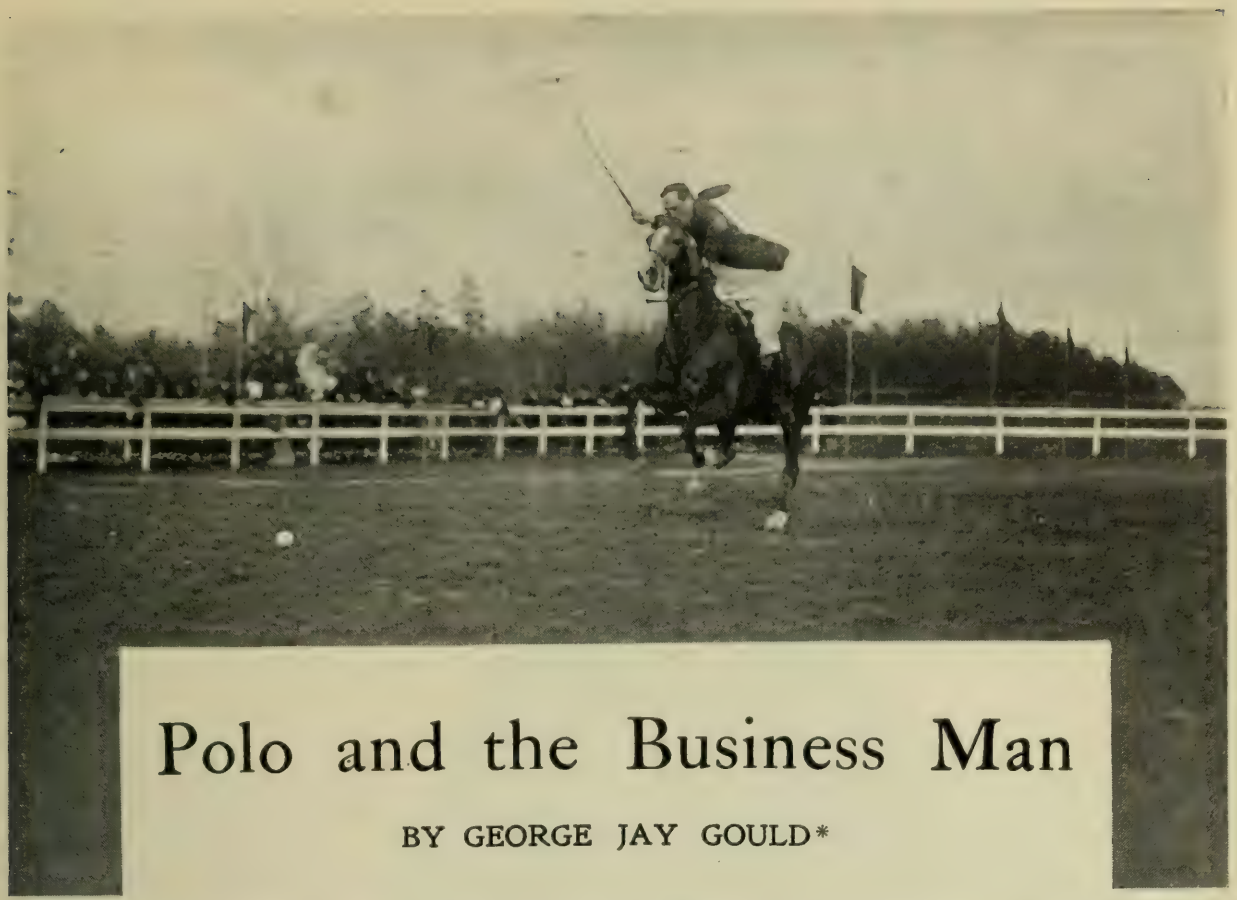
I would not advise the summer vacationist who lacks the genuine sporting spirit to pursue the shore bird. Those who do so should not disgrace themselves by killing the handsome little sandpipers or peeps too small to eat. It is better to go home with nothing killed than to feel the weight of a mean, unsportsmanlike act.

PRINCETON, N. J.

Forgiveness

BY ALFRED AUSTIN

POET LAUREATE OF ENGLAND



Now bury with the dead years conflicts dead,
And with fresh days let all begin anew.
Why longer amid shrivelled leaf-drifts tread,
When buds are swelling, flower-sheaths peeping through?
Seen through the vista of the vanished years,
How trivial seem the struggle and the crown,
How vain past feuds, when reconciling tears
Course down the channel worn by vanished frown.
How few mean half the bitterness they speak!
Words more than feelings keep us still apart,
And, in the heat of passion and of pique,
The tongue is far more cruel than the heart,
Since love alone makes it worth while to live,
Let all be now forgiven and forgive.

Polo and the Business Man

BY GEORGE JAY GOULD*

POLO is a boon to the man of business. He can adapt it to his leisure as he can no other vigorous equestrian exercise. Hunting, he must avail of fixed conditions, but all of the conditions of polo may be made to comport with his convenience. Mechanical devices come and go. The bicycle habit swept the country, reached a climax, and then settled down into steady and permanent utilitarianism. Automobiling is still far from its zenith. Its commercial usefulness has barely begun. But the horse has stayed through it all, and will be with us for a long time to come. It is quite as much the natural ally of man as is the dog. It has been his friend and companion from a time when "the memory of man runneth not to the contrary." We could not discard it if we would, and would not if we could. Iron and steel cannot take the place of horse flesh in the affections of man.

In polo the horse shows great intelligence and often manifests keen interest in the game. In fact, the rider feels that the pony, with which he is in sympathy, is a part of his very personality. They act together harmoniously, the animal apparently divining its master's purpose intuitively and becoming so bridle-wise as to obey the slightest touch of the hand upon the bridle. One might call polo the epitome of all equestrian sports. It involves all of the activities of man and beast; running at full speed, halting with electrical suddenness, trotting, swerving, turning sharply and rushing into a compact mass of horses with the energy and purpose of a football player, while the rider goes through all of the combinations of motions and positions known to "the saddle."

The effect of the game upon the tired body is tonic. Also it stimulates the mind and leaves it tranquil. After a well played match a man is at peace with the whole world. He can take up business problems with renewed vigor and mental clearness. The moral effect of the game is not limited to its health giving quality. To excel in it one must keep regular and early hours, and abstain from strong drink, indulgence in the latter being particularly destructive of accuracy in guaging distances, an absolute essential to good playing. The exercise of the game is an almost certain preventive of rheumatism and kidney troubles. Its athletic advantages are obvious. Altho

* From an interview given to a representative of THE INDEPENDENT.

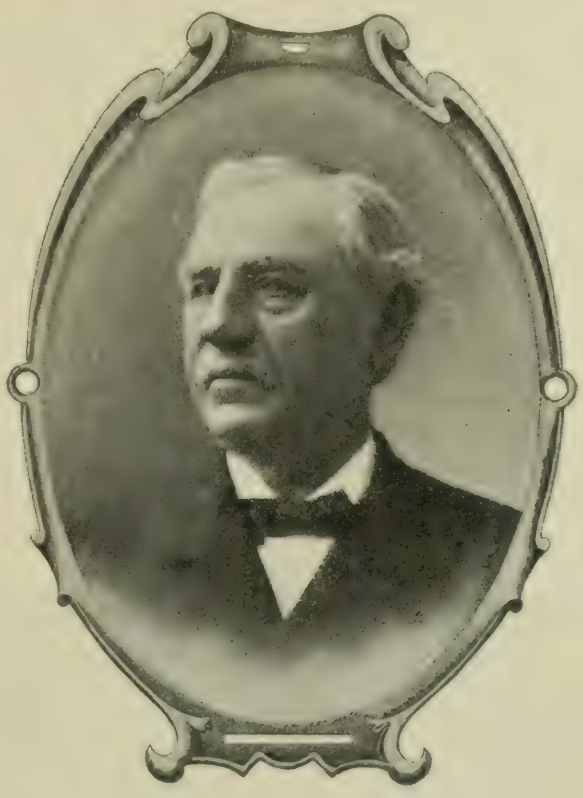
Grand Duke Boris and Sidney C. Love

it may not tend to great muscular development, it makes one lithe, subtle, alert, keen, which are much more essential.

The increasing interest in the game of polo is best shown by the fact that the association which was founded in 1890 with eight clubs now contains thirty-three. Younger men in considerable numbers are becoming interested in the sport. Polo has caused an evolution in the pony. The original polo pony was the ordinary cow pony of the plains. Within the last few years dealers have established regular schools for the education of polo ponies, which has resulted in a very great improvement in their intelligence and speed.

I think the foregoing facts will bear me out when I say that polo is not a fad, unprofitable and shortlived. It is a wholesome, healthful and recuperative pastime. Its growth has been gradual like that of the oak. It has come to stay.

LAKEWOOD, N. J.



An Exciting Moment in a Polo Game at Georgian Court

Fishing

BY WILLIAM P. FRYE, LL.D.

[The following article by the Senator from Maine and the President of the Senate will appeal to every one who has the sense of true sportsmanship and the love of nature. If our readers should suspect that the trout "a bit over ten pounds" was caught by Senator Frye himself, we can only confess that we share the same suspicion.—EDITOR.]

THERE are fishermen and fishermen. I will try in this article not to be supercilious or hypocritical, but try to give even the devil his due. For those who go down upon the seas and seek there a living for selves and families I have only admiration. The disciples fished in the Sea of Galilee. The Master loved them and gave them his aid. I appreciate highly those who encounter the awful perils of the stormy ocean, on the Banks. They are brave, skilled, patient and patriotic. Our country has never been engaged in war when these men have failed her. By the thousands they have ventured to save her on the sea, never minding, never waiting for draft or bounty. General Knox, in public speech, gave the fishermen of Marblehead the credit of rendering most effective aid in the winning of our splendid victories on lake and sea.

WILLIAM PIERCE FRYE

Copyright, 1904, by J. E. Purdy, Boston, Mass.

I have, too, a fellow feeling for the boy who with alder pole, cotton line and wriggling worm lures the speckled trout from his hiding place, for he is but laying the foundation on which he may erect himself into the true sportsman. I propose, however, to deal principally with those who claim already to have become true disciples of dear old Izaak Walton. Fortunately for health, morals and manners, this class is largely on the increase in our country.

Ours is a strenuous people. We give ourselves so absorbingly to business that we get little recreation as we go along, and the result too often is nervous bankruptcy. We are beginning to learn, however, something of the value of a liberal annual vacation, and in this there is hope. But there are vacations and vacations. If we would derive the utmost benefit from one it is not sufficient that it be simply a rest; it must carry with it a change of scene with some pursuit so engrossing as to drive from the mind all thoughts of the workaday world.

It has been said that every man has within him something of the savage, indicated by longings to return at times to primal conditions of life. Certainly to many there come irresistible yearnings for the haunts of nature, for the searching of forest and stream for the daily food—depending on one's prowess for his dinner. In the gratifcation of this desire there is a zest which makes of a vacation a rejuvenation. If the appetite for this sort of thing be lacking or dormant, it should be cultivated or aroused by one who desires to make the most of his holiday. But he should go about it in the proper way. If he would know the delights of the fisherman, let him beware of the vices of the indolent pretender who cares not how he gets a trout so he gets him, who is content to sit in the stern of

a boat and haul through the water a murderous contrivance in the shape of a line armed with a half dozen baited hooks and to drag into the boat by main force a poor lacerated victim, looking more as tho he had succumbed after a fight with a wildcat than after honorable combat.

Let him beware, too, of the pretended sportsman whose loftiest boast is the number of fish he has killed in a day. He is simply a murderer. Steer clear, too, of the man who craftily hooks the trout on the spawning bed and then claims to have taken him on the fly. Avoid, too, him who hunts for the cool spring, deep below the surface of the lake, where the speckled beauties lie in July and August, then with baited hook drags them into his boat so sorely wounded as soon to die. All these be no sportsmen.

Such fishing is on a level with the digging of clams; it gives reasonable prospect of a dinner, but it is not sport. The latter involves skill and prowess rather than blind luck. Your sportsman studies the haunts of fish, their habits and appetites. He regards the selection of his rod and flies as a matter worthy of careful consideration; he has practiced the art of casting until he can drop a fly at the precise point desired. When a trout rises he begins a battle which may continue one minute or thirty, every second of which is a delight and an intoxication. He regards the fish as a worthy foe and gives him a fair chance for his life. If the struggle ends in failure it is to be endured philosophically, and patient preparation is made for another cast. Time is of no account. The business of the day is to catch a trout, and the day is long enough for that purpose; if not, another day is coming.

If, however, after a good fight a fine trout is safely landed it is more highly valued than a purse of gold, and is exhibited with as much pride as tho the like had never before been seen. And with the getting has come the appetite for the eating, the ravenous hunger of a schoolboy, the gratification of which is a joy, a beatification.

But the delights of the fisherman are by no means confined to the fishing. The pleasures of anticipation and of memory are peculiarly his. Visions of cool woods, of mossy banks, of limpid streams rippling over rocky beds, of placid pools and leaping trout bring cheer to many a weary hour. And it is a source of infinite refreshment to turn from discussions of business or political affairs with their conflicting claims to the absolute verities of fishermen's tales. Doubtless this remark will bring a smile to the face

"His weight was just a bit over ten pounds"

From a photograph of Senator Frye's trout taken for THE INDEPENDENT

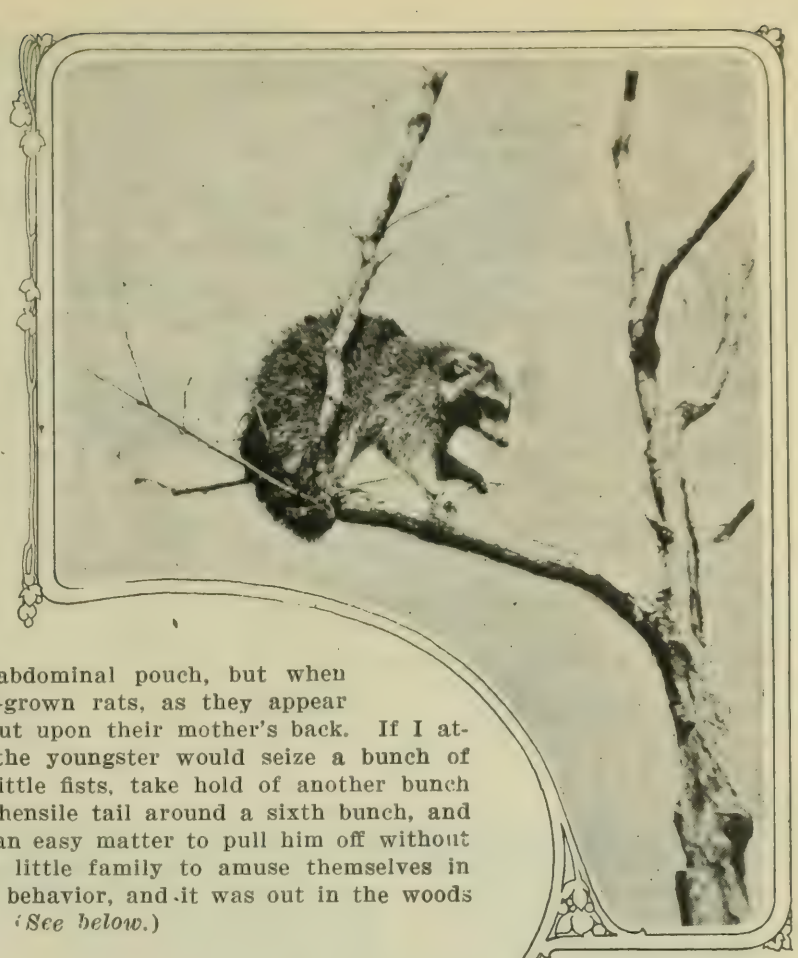
of many a reader, for such stories are frequently characterized in quite another manner. But your true sportsman is prepared to give entire credence to the relations of his fellows, a liberal reciprocity in this regard having long been accepted as a rule of the fraternity. To be sure, the disparity between the fish that escape and those tested by the scale is somewhat puzzling at times, but the golden rule has not yet been superseded.

Allow me to illustrate the ideal sportsman by an incident in his career: He was sitting on the piazza of his camp in the morning smoking a choice cigar. Around him were mountains, hills, bountifully clothed to their very tops, sparkling water, sunshine, singing birds—everything to make one love to live and thank the dear Lord for the living. Opposite to him, twenty rods away, was an island—front of it bushes, snags, burned stumps. A magnificent trout rose, broke the water and disappeared. He knew that the fish, undisturbed, would stay in his chosen haunt for days, that no fly would tempt him while the sun was shining, that no troller would venture near his lurking place. Like a true sportsman he was silent and thoughtful. He had a rod of split bamboo, made by an amateur, every piece carefully selected, the whole hand made—a rod no fish could break. He selected a salmon leader, tested to eight pounds. His guide was sent two miles away with orders to have a double sized brown hurdle made, to return by sunset. He was a patient waiter until twilight, then ordered the guide to paddle him to within sixty feet of the island, with directions, if a trout was struck, to pull at once for deeper water. He then got out about sixty feet of line to his right, then made one cast, the fly lighting beautifully right over the fish, when, like a flash of lightning, the trout rose, was struck and the battle was on. How was it to be fought with the greatest hope of victory to the sportsman? The rod, the line, the leader, the fly were absolutely safe—how about the trout's mouth? The longer the fight the greater the risk of this. So he determined to give him a fight from the beginning and no more line. The contest was a lively one. Three times the fisherman, holding his rod nearly upright, saw its tip on the other side of the boat from him—but no surrender, and in twenty minutes he had the beauty in his arms, and there never was a prouder or happier sportsman in the world. He placed him alive in a car, where he held receptions, hundreds visiting him. Occasionally large trout are ugly, deformed, but this one was absolutely perfect in spots, coloring and form. He was the speckled brook trout, the *saline finbonalis,* and, so far as reported, the largest ever taken with a fly in the world. His weight was just a bit over ten pounds. This man was to me an ideal sportsman. He was patient, could wait, knew the habits of the fish so far as they could be learned by experience, was careful of his fishing outfit, bound not to suffer defeat from any negligence of his own, was content with even only one in a day. I knew him well. He never fished to kill, generally returning his captive to the water unhurt and unpained. I commend him and his conduct to all who love the gentle sport.

LEWISTON, MAINE

ANIMALS PHOTOGRAPHED AND DESCRIBED

BY ERNEST HAROLD BAYNES



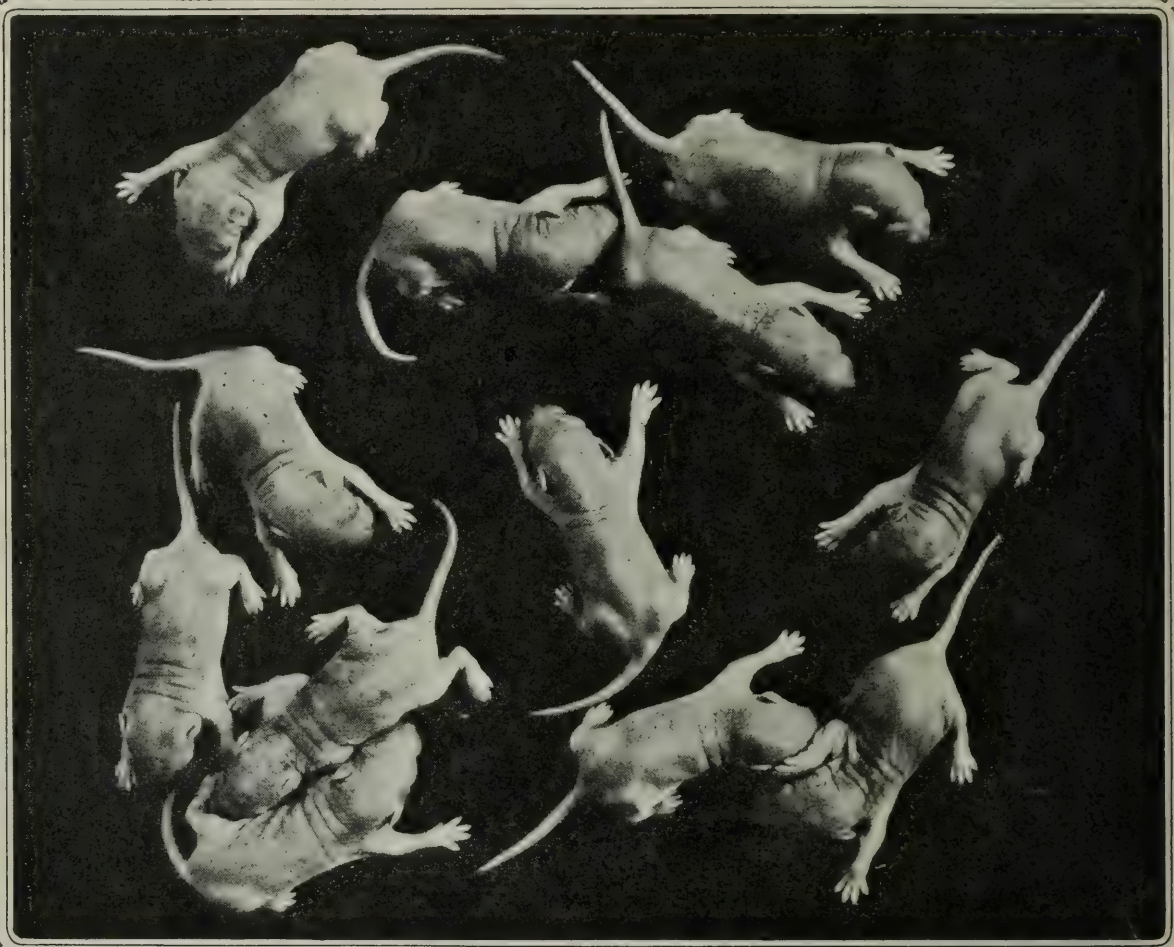
MR. BAYNES AND "THE SPRITE."—As the little fox grew strong on his legs he accompanied his master on his walks through the woods and fields. In spite of the statements of other writers to the effect that foxes dislike water, "The Sprite" was quite fond of it, and several times swam across streams eight or ten feet wide to join me when I jumped over ahead of him. This was when he was a puppy; but later, when taken on a chain to prevent him from running down the neighbor's hens, he would walk close to the water's edge, and often wade out until he was almost off his feet. He seems very devoted to his owner, and tho given his liberty more than a dozen times, has never failed to come home. He is now the father of five puppies, born in captivity.

YOUNG FOX YAWNING.—This young red fox was one of three dug out of a burrow in April, 1903. The cubs were found at a point forty-five feet from the entrance of the tunnel and six feet below the surface of the ground. They were reared by hand on cow's milk, and after being fed they would go to sleep. When they awoke they always yawned, and the picture is from a photograph taken of one of them as he opened his mouth. This cub became a great favorite with the writer, who named him "The Sprite," by which name he has figured in several newspapers and magazine articles.

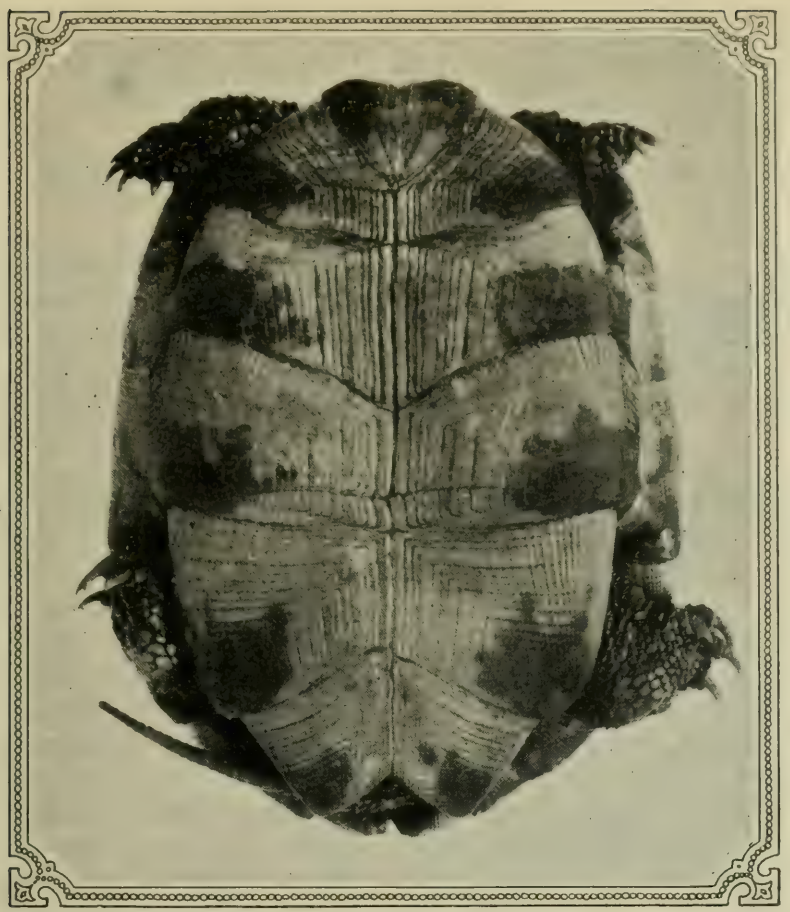
FLYING SQUIRREL.—The flying squirrel here shown is one of a family of four found in a nest of cedar bark in the deserted hole of a downy woodpecker. By feeding and gentle handling they were made so tame that they often foiled attempts made to photograph them by leaping onto the camera. The accompanying illustration shows one of the squirrels crouching for a spring into the air, through which it sailed to a tree about fifty feet away.

RACCOON (treed).—This Raccoon was treed by the writer, who came across the animal as it was feeding near a stream. It was treed several times during the afternoon, and once up a small tree in the open. When a long stick was held toward it it showed fight, hissing and growling and laying back its ears, and it was in this fighting attitude, with its whole body shown against the sky, that this picture was taken.

OPOSSUM AND YOUNG.—The Opossum and young here shown are a family which I have had under observation in Massachusetts for some months. When very young the little ones were carried about in their mother's abdominal pouch, but when they grew to be as large as half-grown rats, as they appear in the picture, they would crawl out upon their mother's back. If I attempted to detach one of them the youngster would seize a bunch of his parent's hair in each of his little fists, take hold of another bunch with his mouth, and twine his prehensile tail around a sixth bunch, and when he held on thus, it was not an easy matter to pull him off without hurting him. I often allowed the little family to amuse themselves in the woods, while we watched their behavior, and it was out in the woods that this photograph was taken. (*See below.*)



YOUNG RACCOON FEEDING ITSELF.—I took this little fellow from his home in a hollow tree and brought him up on a baby's bottle. It mattered not in what position he was held, right side up, upside down, or swinging in the air like the pendulum of a clock, he went on calmly sucking his milk. If left alone he was quite capable of taking a drop by himself.

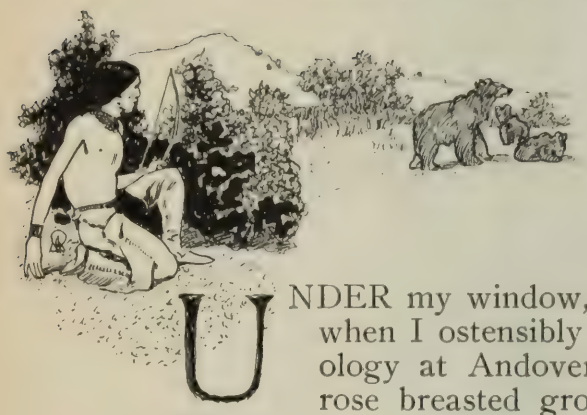


Opossum and Young. (*For description see above.*)

HORNED TOAD OR HORNED LIZARD.—The animal known as the Horned Toad is a gray lizard inhabiting arid, sandy regions of the West or South. It half buries itself in the sand, which it closely resembles, and preys on ants, flies and other insects which approach, and which it licks with a lightning movement of the tongue. The above specimen was loaned to the writer by a well-known scientist of Cambridge, Mass., and with several others was kept under observation for several weeks. It was photographed for the purpose of showing the detail of its curious spiky skin, and also to show the attitude of great alertness which the animal often assumed when alarmed.

LITTER OF YOUNG BROWN OR NORWAY RATS.—The Norway Rat, which usually seeks the shelter of a house or other building during the winter, often leads an out-of-door life during the summer, making its nests in holes in the ground, under the floors of barns or outhouses, and in other convenient places. The litter shown in the accompanying illustration was found in a nest of dry grass and feathers in the center of a pile of loam in a farm yard in Massachusetts, and were discovered when the loam was being removed. The youngsters, which were blind and almost hairless, were brought to the writer, who first photographed them all on a black cloth, and afterwards reared them by hand in order to watch their development.

The Wood Turtle.—The common wood turtle is one of our harmless reptiles. It attains a length of about eight inches. The upper side of the shell is dark reddish-brown, and each is embossed with lines similar to those seen upon an oyster shell. The under side of the shell, seen in the illustration, is yellowish orange, each plate having a black splotch on the outer hind corner. I picked up this specimen in the woods of Massachusetts.



Snapping Turtle's Eggs.—The snapping turtle, which is one of the largest and most savage of New England reptiles, leaves the water usually in May or June for the purpose of laying its eggs. When it finds a suitable sandy spot it digs a hole with its strong claws, deposits its spherical white eggs, and then fills in the hole again, leaving the eggs to hatch, without further attention from the parent. The eggs in the illustration were photographed by the writer after he had raked out about eight or ten inches of sand which covered them. They looked very much like the so-called white alleys which schoolboys use as "shooters" in marble time.

Animal Individuality

BY WILLIAM J. LONG

Author of "Ways of Wood Folk," "A Little Brother to the Bear," Etc.

Illustrated by E. W. Deming

UNDER my window, in the days when I ostensibly studied theology at Andover, a pair of rose breasted grosbeaks built their nest in an apple tree at the corner of Bartlett Hall, and just beneath my favorite reading seat. I watched them there with more than ordinary interest from the moment the site was chosen until the young birds were led away by their parents to learn the ways of the world. No better opportunity was ever given to study the life of a bird family, for I had only to turn my head away from the pile of books and there was the nest with the mother bird standing by, so near that I could see her eyes wink.

I sat very quiet at the window, never climbed to the nest, spread food occasionally, and drove away sundry cats and boys and one despicable egg collector; and so it may be that the birds regarded me as a friend and were less constrained than usual. Certainly they showed little fear of me, tho shy enough with other men. Once, while reading a book on the old bench under the nest, the male, a gorgeous fellow, came down and perched on the chain between the posts and came hitching and twittering along till within reach of my hand, where he turned his head from side to side and looked me all over, and twittered back as I talked to him softly. Another day, when I worked at my desk, the female flew to the open window and called to me excitedly. I went to the window at once, but saw nothing unusual. Still she zigzagged back and forth between my window and a thick lilac bush at the foot of the tree, calling a continuous alarm note. When I ran out she met me at the steps and led me straight to the lilac, where, parting the leaves and branches, I found a big tom cat hiding on a knot at the farther side of the apple tree, waiting with cold green eyes till the alarm should blow over. But I am getting ahead of my story.

Like many other birds, when engaged in any good work, the grosbeaks furnished a curious commentary on our human endeavors. The female did most of the work, and the male did all the celebrating. In collecting materials and in shaping the nest the female was busy as a bee in clover blossom time, hurrying back and forth and doing an astonishing amount of work between sunrise and sunset. Meanwhile the male whistled and sang and frolicked about, bubbling over like a bobolink with the joy of springtime, but doing no useful work whatever. When his mate came back with new material he would fly to meet her, fluttering about her, cheeping and singing as if he were praising her for her diligence, and look on with immense importance as she worked at the nest, rounding it with her own breast to give it the shape she wanted. As he bubbled over extravagantly in his praise her busy silent air seemed to say: "Go 'way now with your blarney." But she liked it, nevertheless, and when, in excess of zeal, he would dart away and come back with one small straw, she would take it from his beak and work it in with her own abundant material.

When the material was at last arranged to suit her the two birds would stand together and she seemed, from her voice and attitude and from his sudden dejection, to be scolding him for his idleness. The lecture ended, she would fly straight away to the foot of a bank where material was plenty, and he would start just as diligently in another direction. Unfortunately he had to cross some chains swinging between the stone posts about the dormitories, and he could never cross a chain without lighting upon it.

The impact of his flight would often set the chain swaying slightly, and he enjoyed the new sensation of swinging, fluttering his wings and bending his neck and tiptilting his tail to keep his balance. When the motion ceased he would flit up into an elm tree, catch an insect or two, whistle exuberantly and forget all about the work till he heard his mate returning, calling gladly as she came on. Then—three times I saw him do it—the lazy rascal slipped up to the nest, hurriedly pulled out of it a mouthful of straws, and, hopping to the end of the branch, held them out to his mate to show her what good work he had been doing while she was gone. At last she caught him and flew at him in a rage and drove him out of the tree, scattering her own material over the lawn in her indignation.

Later, when she was brooding her eggs, the male showed a very different side of his character. Tho I had known grosbeaks all my life, I discovered then that he has one song very different from his ordinary melodious warble. It is low and sweet, and seems intended for his mate alone, for I never heard him use it except when she was brooding her eggs and he was standing close beside her. From my window I could hardly hear it, close at hand, tho I could distinguish his whistling song half way across the big campus; but when sitting on the old bench under the nest I often heard it clearly and could see him standing very still beside his brooding mate, or bending down as if to breathe the exquisite little melody into her ears, as one would whisper a secret. Birds of all kinds are naturally quieter near their own nests, but in this low song of the grosbeak there seemed to be more than the usual precaution against listening enemies.

Always at night I would open my window near the nest before I blew my light out, and then as the light vanished I would hear a stir and a surprised chirp or two from my little neighbors. And often at midnight, as I sat in the darkness at the open window, breathing deep of the fragrance of the summer night and listening in the tender immeasurable silence, I would hear a faint sweet song by the nest, so fine that it was more like the voice of an insect than of a hardy bird, as if the grosbeak were dreaming and singing in his dreams.

Just behind the dormitory another pair of grosbeaks built their nest in a linden tree. Unlike the other, it was hidden away where no eyes but my own ever discovered it. The birds themselves were shy, secretive, silent, as different from their kind on the other side of the house as it was possible for birds to be. Tho I watched them more or less all summer, I saw nothing different from what I had often seen in other grosbeaks, while hardly a day went by without revealing some new or interesting trait in the birds under my window. This was partly, perhaps, because I watched the latter with more sympathetic interest, as one regards the little suggestive nothings of his own children, but partly also because the birds themselves were different in character and disposition.

It was the same room where I befriended a hornet that would get drunk at every opportunity, as recorded elsewhere, and from which, on Saturdays, I often went out fox-hunting with Ol' Roby, a sad-faced old hound that lost his life, at last, in following over thin ice a cunning tramp-fox that had already led more than one foolish dog to the railroad tracks; and the chief lesson of the grosbeak families was this, that every life, however small, has its own problems, its own particular joys and sorrows, and out of these things it develops its own individuality.

Here at last we are on debatable ground, and one must go softly. Let the simplest illustration suffice to get our bearings. You hit a dog with a stick, and the dog yelps and tucks his tail between his legs and runs away. Here is a beautifully simple case of reflex action and instinct, the kind that is numerously recorded in works of experimentation upon animals by the comparative psychologist. You hit another dog in the same place with the same stick, and the dog, without saying a word, and so quick that you forget to take an observation on his tail, turns and gets his teeth into your leg. Obviously here is a case where similar causes do not produce similar results. The second dog may be own brother to the first, born and reared under precisely the same conditions, and

our much cherished law of reflexes ought to apply perfectly; but it doesn't. A new element has come in to modify the result, the element of disposition. "Any stick will do to beat a dog with," says Sancho Panza, and the rule may be safely adopted by the psychologists; but what the dog will do is always an open question, depending entirely on the character, disposition and experiences of the particular animal under the stick.

With the element of disposition, another and more baffling element enters into our study, the element of individual freedom, which may be real or only apparent, according to one's view of the universe and of Augustine's philosophy, but which is, in either case, an element to be dealt with seriously, since at any moment it may upset the most carefully laid scheme of experimentation.

Once, in my more enthusiastic salad days, when after reading certain English and German psychologists it seemed somewhat easier to write a book on animal psychology than it does now, I shut up an old cat with her litter of kittens in a kind of magnified rat trap made especially for the purpose. There was a trap door in the cage, so arranged that by stepping on a spring the door would open to let kitty out, while entrance was easily gained through the roof by means of an inclined board. My immediate object was to find out whether the old cat, after discovering the secret of exit, would show it to her kittens—and that was only one of numerous experiments I made to determine how far an animal consciously teaches its young the things that they would never know of themselves.

She found the spring in a day or two without any help from me, and after that went out and in as she pleased. But she never taught the trick to her little ones. Instead, I saw her, one day, cuff one of her kittens away from the corner where the spring was, and where he might easily have found the way out himself. When the time came she pressed the spring and let all her kittens out, and never entered the cage again. To this day I am unable to say whether she was unwilling to teach, or feared a trap, or whether, being a wise old cat in her way, she preferred to leave them in the cage, where they were safe from prowling dogs, while she roamed about at her pleasure. Meanwhile a friend told me enthusiastically of his own cat, which had learned to open a door by climbing on a box and pressing down the latch. Then she taught the trick successfully to three of her four kittens.

This unknown element of individuality carries us over the borderland of science into a fascinating realm, where as yet only a few pioneers have done any exploration. Here the hard and fast rules laid down by the scientists and comparative psychologists apply only in the most general way, as we apply the adjective *shrewd* indiscriminately to all Yankees, and *volatile* to all Frenchmen, and the word *instinct* to all bird migration. Sooner or later science will explore the new field, as educators have begun the great task of exploring the child mind and determinating its general laws; but for the present one cannot live with a child or watch a single animal closely and sympathetically for a single season without finding that which refuses scientific analysis, at least in our present ignorance, and which one must interpret, lacking other standards, by the measure of his own life—which is, after all, the only thing that he understands.

It is a big world, globe-trotters to the contrary notwithstanding, and Nature seems to abhor repetition as she abhors a vacuum. Owners of dogs and cats and horses need no argument to convince them of the individuality of their pets. The only question is, do wild animals of the same species differ as widely in habits and characteristics as the domestic animals? Personally, after many years of watching animals in their native woods, I am convinced that the wild creature is more individual than the animal dwelling in our houses and stables. Contact with man generally serves to dull the native wit of an animal and reduce him to a creature of habit and dependence. The ducks and turkeys of our barnyards hold no comparison with the wild creatures in their native ponds and woods; the cows and sheep are far below the standards of the deer and bighorn of the forests and mountains. Even the dog suffers in comparison with the timber wolf, and after watching for a season a litter of collie puppies in my friend's stable and a litter of fox cubs on a wild New England hill-

side, I was obliged to confess, tho I am fond of dogs, that the foxes were more interesting and individual in their actions.

Once, with an old hunter who had learned much of his wonderful lore from the Indians, I set a deadfall for a big black bear that had taken to raiding the sheepfolds. At first the cunning old fellow would not go near the trap; then, when the sheep were guarded by day and locked up by night, and a trail of honey was led through the woods to the deadfall, he began to investigate the new source of supply. The deadfall was set beside an old stump. From either side of the stump a row of stout stakes was driven in a half circle, almost meeting in front, leaving a door by which alone Mooween might enter. Across the entrance was laid a single large log, and over it the heavy deadfall was suspended and weighted with a dozen other logs.

Now bears are easily caught, the general idea seeming to be that a bear in approaching the deadfall will put one forepaw over the bed log and reach in the other paw to drag out the bait, which, of course, releases the deadfall and brings the whole crushing weight down on the small of his back, catching him and generally killing him between the fall and the bed log. Nine out of ten bears would do this, but our particular bear did not. First he licked up all the honey as far as the trap and went away. The next night, with the taste of honey in his mouth, he broke into the pen from the side, sprung the trap harmlessly and ate up all the bait. The next time he did almost the same thing, only, as we had driven an extra row of stakes, he did not bother to break in, but climbed up the rear side of the stump and again ate everything in sight. Whereupon the old hunter vowed he would catch that particular bear if it took all summer.

We took away the fall log and set a steel trap just inside the pen, covering it carefully with twigs and moss and leaves, just like the forest floor. Then the old hunter broke forty or fifty short twigs and stuck them in the ground, here and there, some inside the pen and many more scattered along the path in front. On the top of each twig he stuck a piece of strong-smelling meat and smeared everything with honey. When Mooween came again he was so busy licking up the scattered scraps and looking for more that he forgot, apparently, all about the danger and put his forepaw squarely into the iron jaws of the trap, which snapped like lightning and he was caught.

We took up the trail the next morning. Attached to the trap by an iron chain was a short log, not heavy enough to hold the bear, but more than enough to bother him as it jerked along, catching in roots and bushes and leaving a trail that even a city sportsman might follow. Suddenly, however, the trail vanished and the old hunter stood peering in every direction to see where it had gone. As I circled widely, trying to hit the trail again, I came upon a bear's fresh tracks in the mud by a little brook. There was no trace of the clog, and my first thought was that another bear was near; but in another moment I saw that the new trail showed only the prints of the bear's hind feet. I whistled for the old hunter, who came quickly and looked once at the tell-tale tracks. "That's him; he's walkin' on his hind legs," he said briefly—and that was true, as we soon discovered. The bear would drag the clog as long as it followed easily, but when it caught in a root, or when the pain in his pinched paw became too great, he would go back, pick up the clog and go forward again, walking on his hind legs and carrying the drag in his arms. So we found him at last, limping bravely forward, walking upright like a huge monkey, the trap on one paw, the heavy clog under his free arm and the chain clanking against his breast as he walked, as if he were handcuffed.

There is small glory for man in the incident, as one may judge from the fact that I offered the hunter twice the bounty on the bear if he could devise any way of freeing the brute from the trap without at the same time being brained or scalped by a blow from Mooween's paw. I mention the fact simply to illustrate the subject I am talking about more vividly than is possible by making general laws or theories for the Wood Folk. Nine bears out of ten simply drag their clog till it becomes hopelessly tangled in the underbrush, when, like a fox, they lie down, and wait to be killed, when the hunter approaches, with head down between their paws as if ashamed of them-

"That's him; he's walking on his hind legs"

selves. But the tenth uses his wits, and so upsets any theories we may have as to instinct and reflex impulses.

From the bear to the chipmunk is a far cry, but the same puzzling factor of individuality applies to both animals, and indeed to all those between them that make their home in the wilderness. Last summer one of the men whom I employed in the woods tried for weeks to make friends with a chipmunk that made himself very much at home about our camp. One day, when he told me of his efforts and failure, I assured him solemnly that he didn't have the right medicine. I took an English walnut from his hand and sat down on the ground, mumbling a bit of Latin doggerel for medicine. When the chipmunk approached I squeaked two or three times and held out the nut, and the chipmunk came, halting and jumping aside nervously and eyeing me steadily all the time, till he could almost reach the bait. When I drew it slowly away he ran along my leg till he sat on my knee, and then tugged and twisted his head trying to get the nut from between my fingers. To this day the man thinks I had some special power over animals; but it was simply a case of keeping physically and mentally quiet. He had been too eager, too excited, too impatient; and the chipmunk, like certain children, who seem to understand your thought rather than your action, had understood it and was afraid. In a day or two the chipmunk would take food from anybody, even from little Lois when we could get her to sit quiet enough. At first he carried everything, one mouthful at a time, to his den some distance away. When he found that food was plentifully offered, he made two or three intermediate *caches* so as to dispose quickly of what was given him. Then, thinking perhaps that he was wasting too much effort in carrying our gifts so far, he made a new den and employed his spare time in transferring all his store from his first den, far away, to the hollow roots of a tree that stood beside the open door of my little tent.

One day, partly to test his intelligence and partly for the fun of the thing, I tied half a nut to a string and gave it to him, holding the other end of the string myself. He whisked away instantly to the end of his string and fetched up short, turning a complete somersault at the unexpected stop. In a wink he was up again and had seized the nut, only to have it jerked out of his mouth again as he started headlong for his den. He scolded like a fishwife for a minute; then he grabbed the nut and tugged and pulled and worried it, and ran back and forth in half circles at the end of his tether, trying in every way to get away with the morsel and store it away in his den. After a minute or two he grew quiet, dropped the nut and seemed to be studying his proposition, for he sat up very still on his hind legs looking at the obstinate thing, and his eyes were shining steadily. Suddenly he dropped on all fours, came between me and the nut, cut the string with his teeth and hurried away with his booty. When he came back I had the other half of the nut tied to the same string. No fooling this time. Without a moment's hesitation he cut the string, grabbed the nut and away he went, *whizz,* like a bumble bee that has got his bearings.

One might multiply instances of this kind indefinitely. Indeed, as I think over the birds and animals of my acquaintance and see them again in the wilderness, hardly one passes, from the moose to the woodmouse, and from the eagle of the unnamed cliffs to Killooleet, who sang on my ridgepole, without bringing with him some vivid bit of personal experience, which sets that particular animal or bird apart from all the rest. Deer are plentiful about my wilderness camp, and I see hundreds of them in the course of a summer and autumn; but one remembers not deer in general, but this particular buck that drove some smaller deer out of a sunny warm court and lay down in it himself, and that particular young doe, which found her first fawn lying dead, and then went out through the woods seeking and calling him, with the puzzling thought in her poor head that her fawn was a living, answering, lovable reality, and not the cold, mute, silent thing she had just seen. And so with all other animals; the more you know them, the more individual do they become.

The reason why we have so long held the opposite opinion, and put the animals down as all alike creatures of blind instinct and impulse, is a very simple one;

we have noted the resemblances which unite animals of the same species rather than the differences which separate them. Now, resemblances lie on the surface and are easily seen, while differences are deep and comparatively hard to discover. I know two men who, with a shave and hair cut and dress suit apiece, would be indistinguishable across a drawing-room. On Sunday you would bow to one, thinking he was the other; and relying solely upon chance meetings and personal observation (as we do with wild animals) it would take you a year to discover that one is a waiter, a kindly, honest man, who is good to his family, and the other an accomplished musician, who lives chiefly on his emotions and is a moral scoundrel, with a deserted wife and child in his hinterland.

Sit in a box of a theater and look out over the audience only a few yards away; the men all look alike and act alike. For the moment they are alike. Sit at your window and watch the unconscious Sunday strollers at a little distance; again the impression of general sameness in dress, walk, looks, actions, as if they were all alike clothed by nature and blown along by the south wind; yet these men and women represent all the varieties of human character and individuality. Only as we come close to them, live with them, know them intimately, do they show the individual characteristics which separate them from all other men and women.

Now apply that to the Wood Folk. We see the wild creatures almost invariably at a greater distance and at less leisure than we see the theater audience or the Sunday crowd, and we know far less of their motives and springs of action. They look in a general way alike, and act alike, and so we have jumped to the superficial conclusion that they are alike. That means simply that we have seen the surface of things, the passing crowd at a distance. Now go close to the animals, watch them, follow them, win their confidence if possible, and instantly they begin to separate themselves by little individual tricks and traits. This is the secret of the stories of dogs and pets that are multiplying so rapidly, and of the records of the few pioneers who have had the patience and sympathy to go among the wild birds and animals to live with them and watch them and find out how, in their dumb way, they live and think and feel. We are simply discovering the individual differences which separate an animal from his kind, which have always existed, but which we did not see simply because we were too far away—and were perhaps blinded also by our prejudices and our preconceived notion that wild animals of the same kind are all alike.

The biologist has been busy with his microscope, the psychologist with his experimentation, the ornithologist with his collector's gun and egg case and cabinet of dried skins, the hunter with his dogs and sport. Meanwhile the lives of the wild bird and animal are less understood than in the days when the Indians were their only interpreters.

STAMFORD, CONN.

One Poet Dead

BY SARAH PIATT

AND so you mourn, and with this lifted voice,
This one mad clash of many a dissonant lyre,
Because, forsooth, the morning stars rejoice
At one new Singer in their lonely choir!

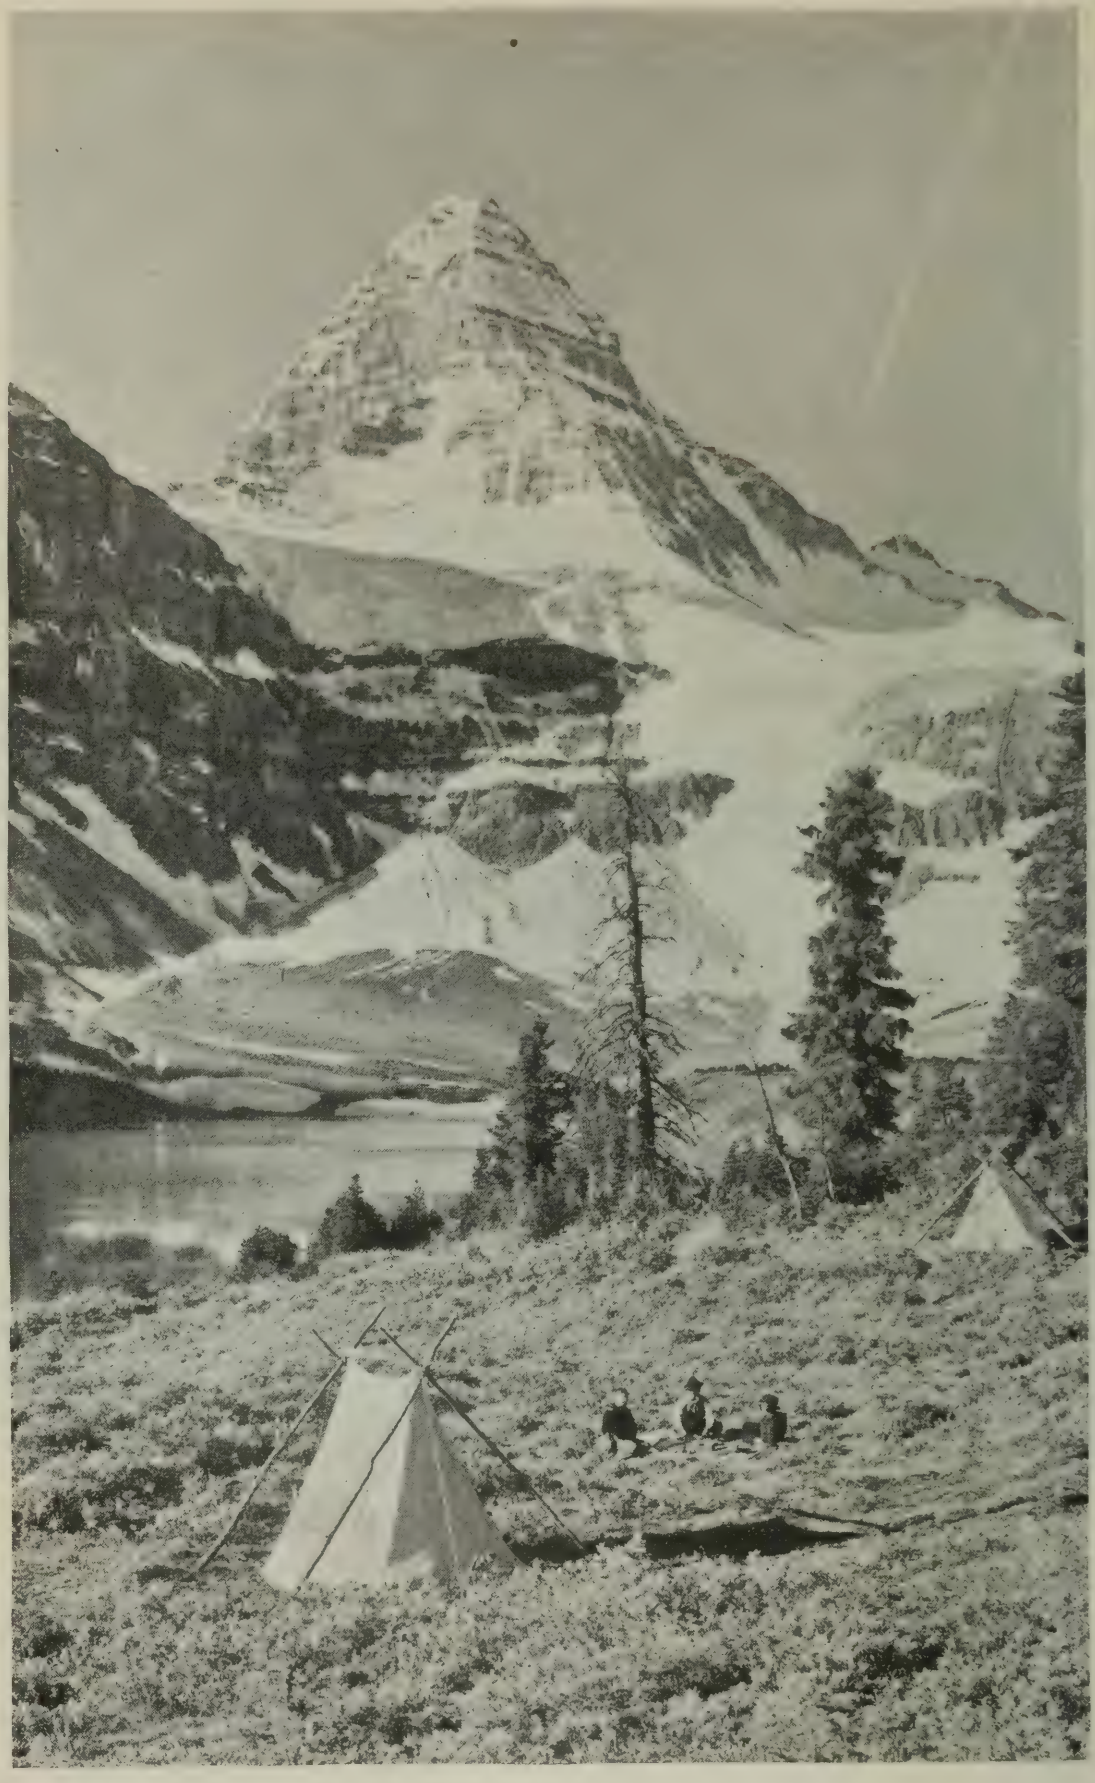
Shall he who sang but with our nightingale
To mortal roses, in our moon-lit dew,
Or with the sky-lark, if it please you, fail
To sing himself yet higher up the blue?

NORTH BEND, O.

The Canadian Rockies

THE eyes of the world lately have been more and more directed to the extraordinary wonderland of the Canadian Rocky Mountains, to which tourists of wealth and fashion are now flocking.

It is the newest and seems also to be the very best of the world's natural playgrounds, for whereas elsewhere one may find a few great beauties and attractions, here all possible attractions are assembled.



There is a perfect chaos of mountains, piled peak on peak, grand, terrible, majestic, fantastic, their sides clothed with dense forests, their snow clad crests opalescent, prismatic, in the sunshine, changing their mood with every new slant of the light. In these forests grow some of the largest trees in the world, many of them rising over [illegible]ee hundred feet in hight.

In these forests and over these mountains roam the biggest game to be found on the continent, the grizzly and black bear, the panther, the lynx, elk, moose, deer, caribou and Rocky Mountain sheep and goat, and the innumerable lakes are at seasons almost covered with ducks, geese and swans. A hundred lodges in this vast wilderness offer their hospitality to the hunter, and from any of them he can set out with a guide and be sure of meeting with bighorn, grizzly or panther if he can stand the fatigue of the trail. Big game is plentiful even near the line of the Canadian Pacific Railway.

gaged in their awe inspiring work, and here the most limpid of waters. Borne in canoes on the Lakes above the Clouds the tourists seem floating in mid-air. Below them they can see the mountains with their forests and snows reflected, the fish appearing to fly about from grove to grove like birds.

There are fossil beds, hot sulphur springs and minerals of all sorts, appealing to all sorts of tastes and interests.

A few years ago the wild beauties of this region were inaccessible, except to the trapper, but now the Canadian Pacific Railway traverses it and has established a score of hotels at various points, with connecting roads and bridges, a fine observatory on Sulphur Mountain and boats on every lake, with camps at various points. Here the Canadian Government has great parks, with an area of 5,000 acres, and in the very heart of the region has risen Banff, a sort of Canadian Newport, to which more and more the tide of fashion is flowing.

One of the best hotels in the country is at Banff, and the tourist, therefore, may enjoy the wilderness without sacrificing any of the comforts and conveniences of civilization.

The parks spoken of are the Rocky Mountain Park of Canada and the Yoho Park Reserve, which are divided by the summit of the Rockies. Banff is situated in the most easterly of these, the Rocky Mountain Park of Canada. Its altitude is 4,500 feet and its distance from Montreal 2,346 miles.

The little town lies in the valley of the Bow, which is surrounded on all sides by lofty mountains. It offers the pleasure seekers wheeling, fishing, riding, driving, bathing, boating, lawn tennis, golf, billiards and bowling, and an orchestra from Boston plays during the evening. A corps of Swiss guides is provided for those who relish mountain climbing.

One has the choice of a great many lakes and streams for sailing and fishing. Some of these are in the immediate vicinity of Banff, and only thirty-four miles

away to the west are the Lakes in the Clouds, of which the first to be reached is Lake Louise (altitude 5,645 feet). This is a lovely little sheet of water, one and a half miles in length, with a width of half a mile and a depth of between 500 and 600 feet. The other Lakes in the Clouds are Mirror and Agnes, the latter of which has an elevation of 6,820 feet.

The Valley of the Ten Peaks, which is new to tourists, lies southeast of the Lakes in the Clouds. Here in the middle is Moraine Lake, bordered on the south by sheer precipices and on the north by a dark forest. Beyond the lake a succession of peaks rise from 5,000 to 6,000 feet above it, their hanging glaciers plainly visible. One of these is still advancing, but all the others recede. Says Mr. Walter D. Wilcox in his book, "The Rockies of Canada":

"No scene has ever given me an equal impression of inspiring solitude and rugged grandeur. I stood on a great stone of the Moraine where, from a slight elevation, a magnificent view of the lake lay before me, and while studying the details of this unknown and unvisited spot, spent the happiest half hour of my life."

Only two hours to the westward of Banff is the "Great Divide," the summit of the Rocky Mountains. Two little streams begin here from a common source. One flows eastward, becoming the Saskatchawan River and emptying into Hudson's Bay, and the other goes west, and as the mighty Columbia runs into the Pacific Ocean.

Near the town of Field is Yoho Valley, said to be even superior to Yosemite in wonder and beauty. Professional hunters are not easily impressed, yet it may well be believed that the first who entered here were lost in wonder and amazement. Lofty mountains and tremendous glaciers surround this valley and "Takakkaw!" Its waterfall is absolutely peerless, springing down nearly 1,200 feet from the tongue of a huge glacier into the valley.

Field is an important point for the lover of nature. Mount Stephen, with its great peak, is close at hand, and fine views can be obtained from the neighborhood

Down Bow Valley from Banff Springs Hotel

Copyright, 1902, by Detroit Photographic Company

of the hotel. Mammoth fossil beds containing many rare specimens are at hand, and among other attractions of the region are Emerald Lake and Natural Bridge.

Eighty miles from Field, in the heart of the Selkirk Range, is the Glacier House, at the foot of Mount Sir Donald, and close to the great glacier of the Illecillewaet. It is but half an hour's walk to the Great Glacier, the charming Asulkan Valley is close at hand, and there also is tall Sir Donald, challenging the mountain climber.

Throughout this great new world's playground of the Canadian Rockies the climate is perfect. As in all high altitudes, the nights are cool, but the days are warm and pleasant, with plenty of sunshine and little wind or rain. In winter it is so fine and dry that it attracts many health seekers, and the sanatorium remains open throughout the year.

Some of the best fishing in the world may be had in this region, the Lower Kootenay being especially famous for its rainbow trout and giant charr. Mallard innumerable flock to the sloughs and back waters of the Kootenay, above Kootenay landing, and it is quite possible to alternate between trout and duck, taking heavy toll of each. The Canadian Pacific Railway Company has put house-boats at the disposal of the sportsmen, so that they may not part with the comforts of home.

Lake Louise, Alberta

Copyright, 1902, by Detroit Photographic Company

The game laws of British Columbia make the open season as follows: Moose (bull), September 1st to December 31st. Females and calves under one year protected. Deer, September 1st to December 14th. Fawn under one year protected. Caribou, September 1st to December 31st. Females and calves protected at all times. Elk (wapiti), September 1st to December 31st. Females

and calves under two years protected. Mountain goats and sheep, September 1st to December 14th. Mountain sheep ewes and lambs protected. Not more than five caribou may be killed by one person in any season, nor more than ten deer, two (bull) elk, two (bull) moose, two bull wapiti, five mountain goat or three mountain sheep (rams). Deer must not be hunted with dogs or killed for hides alone. Ducks may be shot from September 1st to February 28th, and one person may not shoot more than 250 ducks in a season. Grouse of all kinds, including prairie chickens, from September 1st to December 31st. Non-resident sportsmen must secure a hunting license, which costs $50.

Invitation to a Scientist

BY PAUL E. MORE

Brother, awhile your impious engines leave;
  Nor always seek with flame-compelling wires
Out of the palsied hand of Zeus to reave
  His dear celestial fires.

What though he drowse upon a tottering bench,
  Forgetful how his random bolts are hurled!
Are you to blame? or is it yours to quench
  The thunders of the world?

Come learn with me through folly to be wise:
  Think you by cunning laws of optic lore
To teach the enameled fields or burning skies
  One splendor lacked before?

A wizard footrule to the waves of sound
  You lay: hath measure in the song of bird,
Or ever in the voice of waters, found
  One melody erst unheard?

Ah, for a season close your magic books,
  Your rods and crystals in the closet hide;
I know in covert ways a hundred nooks,
  High on the mountain side,

Where through the golden hours that follow noon,
  Under the greenwood shadows you and I
May talk of happy lives, until too soon
  Night's shadows fold the sky.

And while like incense blown among the leaves
  Our fragrant smoke ascends from carven bowl,
We'll con the lesser wisdom that deceives
  The Questioner in the soul,

And laugh to hoodwink where we cannot rout:—
  Did Bruno, of the stubborn heart, outbrave,
Or could the mind of Galileo flout,
  The folly of the Grave?

New York City.

The highest type of the modern racer. Mr W. Gould Brokaw, M. Santos Dumont and Mr. Winthrop Scarritt in auto-car at Ormond Beach, Florida

TWENTY years ago the average city business man worked steadily throughout the year, with almost no recreations, except for one midsummer trip into the country or to the sea. For eleven months he was immured in the city, an absolute stranger to the beauties of the changing seasons, to the spring burgeon upon the hills which lay beyond his horizon, or to the autumn brilliance of the countryside. When midsummer came he tore himself from his work and, with tired eyes and brain, strove, usually in vain, to come into sympathetic touch with nature. For one transient period he struggled to break the methodical, work-a-day habits enchaining him and, completely reversing his daily routine, strove to be athletic, to find pleasure and rest in those recreations which had grown, through disuse, foreign to his nature. Thus, just as he was perhaps commencing to adapt himself to the new conditions, he returned to town and forgot everything outside of it for another year.

One has only to remember this to realize how vastly the times have changed. To-day the busy city man is also a sportsman, a lover of nature, with greater energy for his business, because his body is healthy and active through constant exercise in the open air, and because his brain is the clearer, more buoyant and vigorous in consequence. Instead of shutting himself in the city from one midsummer to the next, he either owns a country place near town, where his family spends six months of the year and where he raises fancy poultry or cattle or fine horses, or he is a member of a country club and runs out there once or twice a week for a game of golf. The city business man nowadays is studying model farming or the breeding of dogs. he hunts, drives or motors, and is keenly alive to the beauties of the country as they are revealed to him throughout the year.

What has brought about this marvelous and splendid change? First, the influence of foreign travel and the observation of English and continental customs; second, the bicycle, the vogue of which swept the land and afforded countless thousands of city dwellers a cheap and quick method of faring forth into the country; third, golf, which caused the building of country clubs in the neighborhood of every town and city in the land, and which lured men to the enjoyment of vigorous, physical exercise un-

der the pleasantest of circumstances, and, fourth, and in some ways, most important of all, the automobile.

Through these agencies the city man learned several lessons. He learned that all work and no play not only makes Jack a dull boy, but does not accomplish the best of work. He learned that, with the development of the stenographer, typewriter and telephone system, his work grew more and more nervous and concentrated, because much less time was spent by him over mechanical details. He was accomplishing, so far as results went, an eight-hour day's work in a morning, and that consequently he had to have exercise and recreation or else break down. He learned that frequent and short holidays kept him in far better trim, both for his work and for his play, than taking the latter in one solid, indigestible chunk at rare intervals. He learned that a model dairy was as fascinating a problem as a Wall Street deal, and that a morning ride from his country home to the station on his way to town was quite as enjoyable as preparing a brief for his largest client. He learned that he looked surprisingly well in shooting or golf clothes, even at forty or fifty. And he took a sudden interest in how the English country gentleman dressed.

When he reached this promising state of mind the automobile arrived.

And, behold, to-day the American man of affairs who is also a country gentleman! In his beautiful new motor he spins out into the country and, with a freshened mind and a new zest in life, he is not only learning to be an excellent mechanic, but a nature-lover, with a broader, sweeter personality, an enlarged horizon and a saner view of life. The automobile is not only one of the greatest of vacation agencies, but a power in our civilization, because it creates a wider, richer world for the owner. And nowadays his name is legion.

Such men as Mr. Foxhall Keene, Mr. William K. Vanderbilt, Jr., Col. John Jacob Astor and Mr. George J. Gould have done much for the motor in this country. The first two have gone in chiefly for racing, and, being thorough and all-round sportsmen, have helped place motor racing on a very high plane. The races at Ormond Beach, Florida, last winter, for instance, brought together a distinguished crowd of motor enthusiasts, and added much information to the subject of high speed cars, both as to

their construction and their management. The latter two gentlemen have not taken as much interest in motor racing as in motoring for family and general country use. Each has a perfectly equipped garage on his country place, and is a constant experimenter in the latest models. The Automobile Club is officered by men of the highest distinction, and such members as Mr. James B. Dill, the corporation lawyer, who motored from his home in East Orange, N. J., to his summer camp at the Rangeley Lakes of Maine last summer; Mr. James L. Breese and Mr. Harry Payne Whitney attest the practical interest which men of larger wealth and responsibilities take in the subject.

Mr. Winthrop Scarritt, the President of the Automobile Association of America, has written that the value of the automobile as an educator is incalculable. Boys of to-day whose minds have been considered not sufficiently developed for the digestion of abstruse problems readily learn to work out horse-powers from cylinder diameters and crank throws and to explain the difference between steam engines, electric and gasoline motors. Imagine, for instance, the possibilities of a generation of Americans, with their natural aptitudes for inventions, having a thorough knowledge of mechanics, which, in the application, will help to make life's burdens less irksome and pleasures more intense. The motor teaches mechanics under the guise of a pleasurable recreation. It has come to us as a luxury, but it is past the stage of being merely a fad and has emerged into one of the necessities of life.

The time is not far distant when the inevitable slump in price will come, and it then will become the vehicle, not only of the few, but of the many, bringing with it a relief from city life, from congested street car and railway travel, and opening up the country for modest homes, to which city workers may daily escape.

Already as a vacation agent it opens up the countryside to the city dweller, and it is fascinating to picture its future, to imagine the creation of thousands of miles of smooth and well graded highways, born of its influence, piercing the country, over which sweep endless pro-

The Gould Children in Automobiles at Lakewood, N. J., Showing the Adaptation of Motor Cars to All Ages.

An Automobile Face

cessions of light, graceful and inexpensive vehicles, bearing men and women to and from their homes and places of business. Imagine our city business streets free from horses, clean and dustless, and great national highways stretching from ocean to ocean and from North to South, bringing isolated villages in touch with the larger life of the world! Imagine a healthier race of workingmen, toiling in cheerful and sanitary factories, with mechanical skill and trade-craft developed to the highest, as the machinery grows more delicate and perfect, who, in the late afternoon, glide away in their own comfortable vehicles to their little farms or homes in the country or by the sea twenty or thirty miles distant! They will be healthier, happier, more intelligent and self-respecting citizens because of the chance to live among the meadows and flowers of the country instead of in crowded city streets.

It is not difficult while in this strain to imagine a complete revolution in railway travel. Mr. W. H. Hayden, the railroad expert, predicts that the time will come when, by means of automobiles, railway companies will collect their passengers from their homes, just as they collect their freight, and that from each station innumerable automobile services will extend into the country on all sides, opening it up to city dwellers. Possibly this comparatively clumsy railway train and the trolley car, restricted as they are to the rail system, will be supplanted by methods of transportation accompanied by less dirt and noise and marked by more deftness and responsiveness to the hand of man, by engines that would be under such perfect control that rails will be unnecessary. Instead of cumbersome, gigantic railway trains departing at infrequent intervals, there will be innumerable smaller vehicles for two or more passengers each, running constantly.

In other words, may there not be a reversal to the picturesqueness of the old stage coach days without the attendant discomforts and slowness of those historic vehicles? Surely the time is coming when the roadside taverns and country inns will be revived to enjoy a new period of prosperity, when travelers, instead of being herded together, will travel lightly, swiftly and noiselessly from place to place, each little group in its own vehicle and each vehicle a perfectly constructed, swift-winged motor, which will be one of our strongest agents for civilization, as well as a most delightful vacation agent, carrying rich and poor alike into a better understanding of nature and teaching them the pure and refreshing beauties of the country.

New York City.

The Injustice of Vacations

BY RUSSELL SAGE

DURING the eighty-eight years of my career I have not once taken a vacation.

A young man said to me the other day, "Mr. Sage, would you not have taken a vacation if you had worked for some one else?"

I replied that I would not.

I have never been an advocate of what some term the "vacation habit." When I was a boy the practice was not in vogue. As a matter of fact, I was so glad to get a chance to learn business that the idea of asking my employer to make me a present of two weeks of the time that belonged to him because he had paid for it would have been preposterous. Besides, I was eager to advance in business, and could not see how I could do this by wasting valuable time.

Neither did any of my youthful associates take vacations, and I am sure you will agree with me that the fact did not retard their progress when I say that among them were Thurlow Weed, the King maker, Horace Greeley, Governor Seward and George Jones, the founder of the New York *Times*. These men were constantly at work, and they were history makers.

RUSSELL SAGE

I think the "vacation habit" is the outgrowth of abnormal or distorted business methods. I fail to see anything legitimate in it.

Let us assume that an employer and his clerk make an agreement to exchange just remuneration for reasonable services, and each one keeps his part of the agreement. Are they not then quits? If there is any obligation, I think it is on the part of the clerk, who avails of the credit, skill and organization of the employer to learn a business and advance himself along a path which has already been prepared for him. What right has he, then, to demand or expect pay for two weeks' time for which he renders no equivalent, not considering the serious inconvenience to which he often puts his employer?

Suppose we were to reverse the conventional order of things and, instead of the clerk demanding two weeks' pay gratis, the employer should demand two weeks' work without pay as a condition of retaining the clerk in his employ. What a tremendous howl would go up.

It may be urged that the clerk by his vacation gains in health and vigor and is thus enabled to render better

service to his employer. If this claim were true he would be justified in asking for a vacation. In fact, he would not have to do so, as his employer would for his own gain and of his own accord send him away thus to recuperate.

But is it not absurd to suppose that a man who can work for eleven and a half months cannot as well work the whole year? Is it not equally absurd to suppose that a man can in two weeks recuperate from the wear and tear of a year's work, if there be such wear and tear? On the contrary, I have too often observed that men will, while on their vacations, make inroads upon their vitality and purses that cannot be repaired in the following eleven months and two weeks.

Then, again, the loss of time, the disorganization of business, that result from the absence of a valuable man from his desk are difficult to repair. A man sometimes must spend weeks catching up with work that has accumulated while he was away on vacation respite for a fortnight.

If a man will only take an interest in his work, love it, he will not need anything else to recuperate him, and men who learn to love their work invariably succeed.

A man should work "easy," be economical of his time, conserve his forces and not worry. It's worry and not work that makes the hair gray.

The doctors may recommend a change of air for a man when he's sick; but why be sick? Sickness is an irreparable loss of time. If I had a thousand tongues I'd preach "Save time" with them all. It's infinitely more valuable than money.

We read of Gladstone, who got all the recuperation he needed by simply changing his work. He didn't quit work and go idling about. Time was the most precious thing in the world for him, and by availing of every minute of it he practically did the work of an army of men.

NEW YORK CITY

Salmon Fishing in Canada

BY W. S. RAINSFORD, D.D.

RECTOR OF ST. GEORGE'S CHURCH, NEW YORK CITY

THERE is no fishing that compares with salmon fishing. The Why is not hard to supply. The salmon is hard to find, and where he is found, Nature is usually at her loveliest. A salmon river is a thing of beauty when the banks are in the first fresh glory of the spring, when ferns are beginning to uncurl, and you expect to see your first fresh-run fish laid out where water-buttercups are yellowest. Then he is hard also to hook—the most capricious of all fishes. Sometimes any fellow can take him and take him with any fly, let tackle be coarse and let his line fall as clumsily as a cable; and on another day, seemedly with no reason whatever, the least bow in the line delivered to a shy fish is altogether fatal. A fly must come to his kingship's very nose and, as it were, poise there for a delicate instant. If not it doesn't win the honor of the slightest rise from him. But to the patient salmon fisher there at last falls, once or twice in the soft June weather, a day of days when the great fish will come with a rush and swirl that make the heart almost stop beating; will come almost half way across the deep pool to seize the lure. Once on, and well on, he is not so hard to kill; yet there are chances, oh, so many of them, against it, especially when you fish, as a true sportsman should when it is at all possible, from the shore. Now the shores of a salmon river are things of beauty, but things of slippery danger as well, for the stones are round and treacherous, and the holes so suddenly deep. Wear wading-trousers up to your armpits, and yet, in an instant, you may be over them, and this may be quite a serious matter, for, with the current running anywhere from four to ten miles an hour, I can conceive of few things so helpless as a man turned upside down in the brown swirl, and trying to save his 16-foot rod from breaking. I have been there, so I know. I very much pre-

fer flannels and stout, well-nailed boots. The water is seldom too cold for health, and a small bag will carry a change of clothes to be promptly put on when you leave the river.

But, Mr. Editor of THE INDEPENDENT, you do not want a dissertation on salmon fishing. You want to go to the river side. Ah! who doesn't, now that the glorious spring is calling to us all, tho, alas! how few of us can obey as we would like her calling, and once again see the splendid silver side of the king of fishes flash in his first impetuous charge for freedom. Well, to the river side let us go, and it shall be a little brown river—not so very little either, for it is over a hundred and fifty miles long, and it is far away in Arcady, where, from the depth of woods that have never been burned, and from the heart of rocky mountains that were the very first to lift their heads above the gray waters of long ago, the best salmon rivers in the world run almost untroubled to the great Northern Gulf.

Dr. W. S. Rainsford

Once the T. was in good repute for its salmon. They were large fish, and there were many of them, and, moreover, they were very hard to kill, because tho, as a general rule, the salmon stays in the pool which he has swum so far to reach, and when he is hooked contents himself by charging around it or through it, these salmon had a way of leaving pools that was very inconvenient, and rushing up and down the river, to the confusion of the man who tried to follow them along the bank. Now, if you are fishing from a canoe, this habit of the salmon gives very little trouble. If he runs down the nearest rapid, you slip after him. If he rushes up river, your canoemen get out their poles and do their best to follow him, and, if the steersman is careful to keep the canoe at the same side of the big river rocks on which the fish has gone down, you are pretty sure to secure him, even if he goes for a mile; but, as I have said, when you are on shore, it is a totally different matter. Round stones and slippery stones, stones of many tons and treacherous little pebbles, altogether they

are a terrible impediment to run over. And on the T. the whole bed of the river is full of sharp rocks that seem especially devised to help the salmon with very little difficulty to cut the line.

I said that the salmon was a hard fish to find. Of course, on some favored rivers the fish are so thick that almost a tyro can mark their places of resort by watching for the fish's rising. But even this is no certain clue, for salmon will often everlastingly refuse to take the fly in spots where for sheer sport, season after season, they are perpetually to be seen jumping. Indeed, each river has its own secret spots, and to tell them requires local knowledge. The most experienced angler is at fault. Of course, generally speaking, at the tail of a dark pool, especially late in the season, you are likely to find a fish; sometimes at the very head of a pool, too, a newcomer will lie, and he is almost sure to be a rising fish. The most experienced angler will not despise the aid of an intelligent boy whose work or sport makes him know the bank. Each salmon river is like Rachel. Her favors are won only by years of patient service.

But let me go back to the brown, swirling T. I said it was once a good river, but that was long ago. The French Canadian may have many virtures, but alas! he has at least one persistent vice. Of all poachers he is the worst. I have known him to make journeys for days along hard trail, through most difficult country, toting loads that would kill an ordinary man, for what seems to be almost the bare love of destroying the fish which, at that time of the year, were wellnigh worthless for food. He will spear fish on the spawning bed when the flesh is only fit for a pig. He will rent you his water and, with his fellows, thinking the whole matter a good joke, sweep it one night with a net—that is, if he can do it without being caught; and, since the T. runs for the first six miles of its course through a rich, sunny farming valley, Fate has dealt hardly with it. Those six miles are about all the good fishing it affords. It plunges then into impenetrable forests, and, if there are places where the fish might be hooked, they are very distant and it is desperately hard to get to them. For the space of the aforesaid six miles, with one or two sharp rapids and a rough turn here or there, it would be, if left alone, an almost ideal salmon stream. And yet I know there is another side to this picture. We fishers are far too inclined to ignore that other side. The "habitant" works hard all day during the brief summer, and when the evening comes, with his long cane rod, a home-made trout fly at the end of it, he will work for hours on the chance of getting enough trout for his supper. He knows every corner of the stream where it washes his narrow farm front, and, if pater familias is too tired to go down to the bank, surely one of the gang of children that fill the house will have sufficient enterprise to go forth with the family rod. (I know one man in that valley who has thirty-two children, and families of twenty are quite common.) So you see the salmon has a hard time, and the glory of the stream is a thing of the past.

Some years ago I took a little wooden house about three miles from the T., and on a certain bright morning in June in the long wicker fish pound that ran down to the gulf in front of my house I noticed a commotion among the boys that had gone out to gather into baskets the smelts, herrings and flounders that were left by the receding tide. Presently, with yells and shouts, the youngsters arrived, carrying in their arms a twenty-five-pound salmon. I did not say anything to the boys, but I made a careful examination of the banks of the river for many miles. That salmon in the pound meant that there were other salmon that had escaped the pound, going up the little river again, and, sure enough, at the tail of the pool, shown in the photograph in this article, I saw a small fish lying, and a few feet higher up I could catch the outline of a larger salmon. I got out my tackle next day, said nothing to anybody, and went up river. To make a long story short, I got hold of four fish and saved two, one of them twenty-three pounds. I tried to smuggle that fish home in the bottom of my calèche, but perhaps his tail stuck up. Anyway, the fact was given away, and with the new signs of the possibilities of the stream, my friends the habitants went to work. For a few dollars, however, I managed to rent that one pool, and I surely got my money's worth. I think the rent was $20.

I have been lucky enough to fish many a salmon river. As a boy in Ireland long ago the passion for it seized on me one momentous evening when, fishing for white trout, there suddenly came a swirl as tho the whole river was boiling to my small red hackle, and, all unprepared as I was—a very short trout line, a very cheap trout leader, a little 11-foot Castle Connell rod that cost only ten shillings—with a joy that was positively awful, I found myself anchored to my first salmon. What a monstrous whale he seemed, yet he weighed only six pounds. But that day was a red letter day. I have fished many streams since then in the old land and in the new, but there were peculiar qualities about the little T. which seemed to me to make it more worth while than any of them. Let me end by telling the story of a fish I lost:

It was the beginning of August. The season had been dry and hot, and the T. was very low indeed. There was no chance of getting the salmon up until long after the sun had set. The season ends on the fourteenth, and I thought I had taken my last fish. However, the drive to the pool was long enough and beautiful enough in itself, and the drive home down the valley, with the moon coming over the hills, was something that could not be too often repeated. And so it came about that toward the very end of the season, and the sun had been off the pool for more than an hour, I tried my luck for the last time. Each river has its traditions of great fish seen and taken, and the T. had its of its occasional forty-pounder. I am trying to be truthful—a hard thing I know it to be from an extended experience of the best men in this particular. But the fish that lazily rose and fastened to me that night, if he weighed an ounce, was over thirty-five pounds. And there in the dark I had it out with him for forty minutes. Now, let me say here, that if ever a man tells you he was two or three hours with a salmon you may know that he doesn't know how to fish for salmon. With ordinary rod and tackle, bar accidents, a twenty-five pound fish ought to be killed in ten to fifteen minutes, and if the water is running rapidly, he may be killed in quicker time. I have killed a fresh-run twenty-five-pound fish—just to see how quick I could do it—in two and a half minutes by the watch. But the river was low and the deep water in the middle of the pool silent and slow, and the fish had the advantage of me, and, drag at him as I would, it was slow work bringing him to shore. But at last under the gaff he came, and his great length lay clear on the very top of the water. And here my poor little Frenchman lost his hand and his head, scatched his great side and let him off. The sting of the gaff produced one more brief, fierce run, and that run was the undoing of me. The line ran out and I made little doubt that I would get him in again, but, as he hung in the middle of the pool, there suddenly came to my fingers the lamentable sense of something wrong. You can't describe it—only experience enables you quickly and certainly to judge. I knew I was afoul of something. What could it be in twenty feet of clear water, right in the center of the pool? I went up above and tried to get a pull there, then went fifty yards below. He hung as if fastened to the planet. I knew my fish was round a rock, and yet I thought there wasn't a rock there. A most careful study of the water never revealed any sign of a sunken log. All the same, calamity had overtaken me. It occurred to me that if I could get to the other side of the pool, since the fish had caught round some obstacle (whatever it was) from this side, I might be able to free him. But how was I to get over? It was black night, and the rocks were sheer and slippery. To get across I would need both hands to swim, and it wasn't easy swimming and to clamber out on the other side. A bright thought occurred to me. I would tie the butt of my 16-foot rod to the waistband of my breeches with my necktie, and, having thus furnished myself with a tail long enough for the devil, I took a header in and did the best I could to get to the other side. I explained my plan to my Frenchman, almost hysterical by this time, whereupon he began to call volubly on all the saints, for what precise end I could not quite make out.

Well, it was done, and I stood, dripping but victorious, on the other side. But, alas! the line was as firm as ever. And so, almost at ten o'clock at night, anchored to that wretched fish for over two hours, with a heavy heart I had to

break my line. That was a salmon I didn't catch in the T.

The mystery of that dark pool's center had so stirred my curiosity that I made a bargain with one of my habitant friends when the river was frozen over to cut a hole over the exact spot and use a lumber grapple to see what lay there. And sure enough, the next winter revealed the stump of a black birch (wood so heavy that it always sinks), carried down no doubt by the spring freshet, and lying hidden under twenty feet of water in the very center of the pool.

NEW YORK CITY.

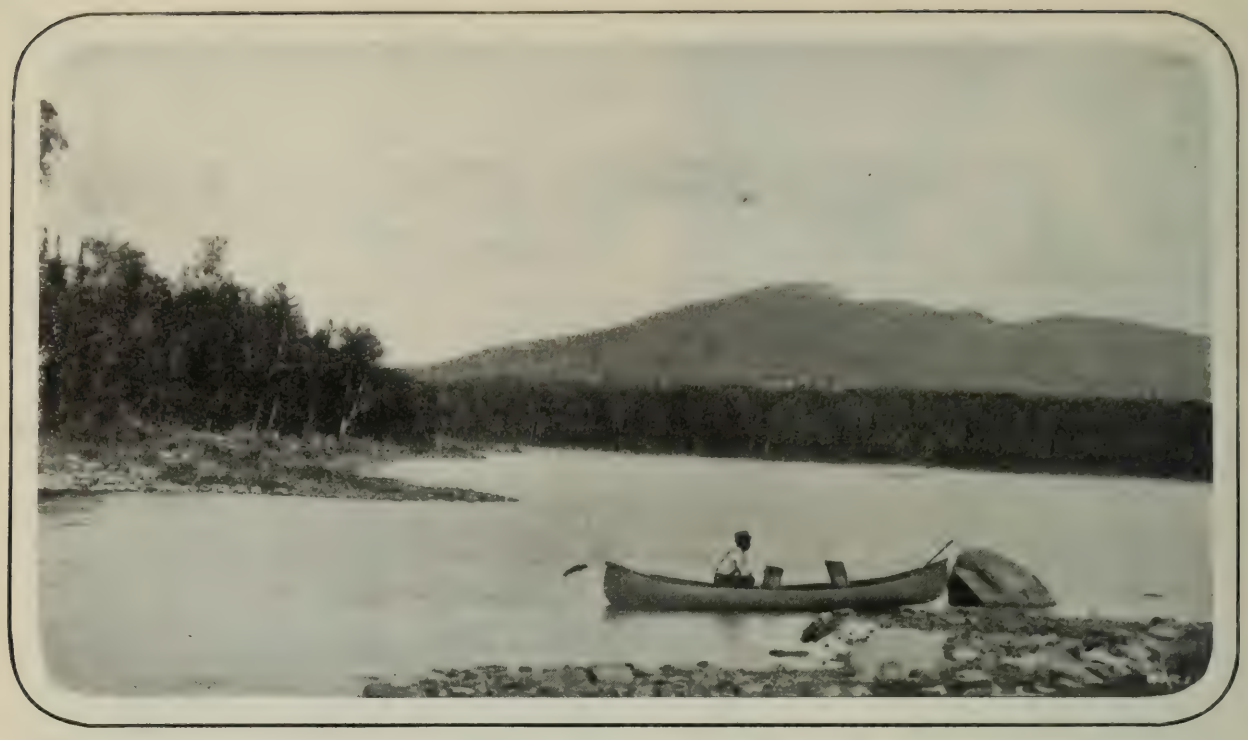
IF you had been with us—the guide Peter and me—when the stanch "Rebecca" was steaming away with us from Kineo to Northeast carry, I am sure you would have thought, as every one else on the boat did that morning, that Maine is, indeed, the ideal land for an ideal vacation trip. We had come half way up the forty-mile stretch of Moosehead Lake on the previous day and stopped over night in America's largest inland water hotel, the Mount Kineo House; now we were bound for the head of the lake, and the actual beginning of our two-hundred-mile canoe trip down Penobscot and Allagash waters. It was a typical August morning; not the hot, dusty kind of the city, but the clear, wholesome, regenerative kind which belongs exclusively to Maine's natural playground, its great north woods; and as we steamed along over the broad bosom of the lake, with densely wooded shores stretching back on both sides from water line to horizon, the ecstacies of the situation permeated my very soul, and I thanked Fortune I was alive—and there.

On leaving the steamer at Northeast carry I found it an easy two-mile ride

"In the Shade of the Shelt'ring Woods"

by team across to the Penobscot River, our canoe and luggage going over in the same tote team with Peter and myself. There are good hotel accommodations at both ends of the carry, but Peter and I were headed for the deep woods, and preferred to embark immediately on our voyage rather than linger any longer than was necessary in the atmosphere of "the States."

We had paddled perhaps two miles and a half down the Penobscot when Peter turned the canoe up Lobster stream, which came in from the right, saying: "There's a lake up here worth looking at." And so there was—Lobster Lake—about six miles long, and one of the handsomest bodies of water I have ever seen. Crescent-shaped sand beaches interspersed with jagged headlands of rock of peculiar formation made up the shore line, with a most charming background of wooded hills and mountains. I was too delighted with the place to leave it in a hurry, and Peter's suggestion that we camp over night in one of the many picturesque groves along shore met with my instant and heartiest approval.



Next morning, even tho we were not up with the proverbial lark, there certainly was no dearth of feathered forest denizens in our neighborhood to announce the coming of a new day. From somewhere down near the outlet of the lake came the *pump-er-lunk, pump-er-lunk* of an industrious American bittern, or stake driver; nearer at hand, in the treetops which formed a dense canopy over our tent, it seemed as tho a whole chorus of birds must be holding their morning rehearsal; and despite the fact that each one carolled his own song in his own time, it made a whole which was wonderfully harmonious, a symphony of the woods whose magic charms are with me to this very day.

Slipping back down Lobster stream to the Penobscot River, we were not long in making the eighteen-mile run to Chesuncook Lake, passing a forest hotelry, the "half-way house," and several picturesque islands on the way, and encountering a few stretches of quick water which brought Peter's skill as a canoeist to good test. Chesuncook Lake, with its eighteen miles of length and three of width, offers an unusual wealth of scenic attractiveness, a statement which my camera films can readly back up. The towering tops of Katahdin and lesser mountains lying off to the east and south were majestically beautiful from this vantage-ground.

Had we wished to continue down the Penobscot we would have paddled down the length of Chesuncook and into Ripogenus waters. Instead, we were seeking a northern outlet, and, crossing the head of the lake, turned into Umbazooksus stream. The first five or six miles here were easy paddling; then the water quickened, and we were compelled to pole and drag the canoe along through rips and over rocks to Umbazooksus Lake. Peter said it was only a three-mile jaunt, but I could have sworn it was thirty long before we came again

Some Aroostook Water Denizens

The Squaw's Face at Lower Indian Pond

to "floating water." We found Umbazooksus Lake held shallow for a considerable distance from shore, but, thanks to Peter's intimate knowledge of the place, we crossed without mishap to Mud Pond carry, where the proprietor of a woods camp offered us snug housing for the night and a tote team to take our canoe and luggage over to Mud Pond early the next morning.

It was while paddling noiselessly along the shore of Umbazooksus Lake in the evening that Peter and I rounded a wooded point and came upon our first moose, a noble great bull, standing knee-deep in the water and feeding on succulent lily-pads. The huge fellow saw us as soon as we saw him, and wheeling about with a snort and a mighty splashing he dashed to shore and plunged into the woods, where we could hear him crashing through the forest as he ran.

Mud Pond was the first water of the Penobscot east branch system which we had come to. A short paddle took us across the pond, down the outlet, and into Chamberlain Lake, one of the largest and most important bodies of water in Maine's great north country. Striking off up the lake for about six miles, we came to a dam, necessitating a carry of perhaps ten rods, and then we were fairly launched in Allagash waters.

While passing through Eagle Lake I remarked to Peter that I thought here was enough of a scenic feast to satisfy any epicure, but when, a few miles farther on, we glided out onto the glittering bosom of Churchill Lake and found ourselves encircled by a forest hem of varitinted green, lightened here and there by the first brilliant hues from autumn's palette, and backed by somber velvet-clad hills, I declared in no uncertain tones that here was the scenic gem of all the trip. At the head of Churchill Lake, at Chase's carry, a dam prevented further progress by canoe, and Peter and I had the pleasure of toting our canoe and camp impedimenta across the carry in the midst of a pouring rain. Below the dam we found the stream very rough, and, acting on Peter's advice, I kept to the winding path on shore, while he skilfully worked the loaded canoe down the tortuous channel for a mile or more.

It was late in the afternoon of the seventh day of our trip when "Betsy" (Peter's canoe boasts that euphonious appellation) pushed her nose into the ripples of Umsaskis Lake and brought Peter and me into a veritable Elysium, more charming, more grandly magnificent, than any other scenic offering Nature had before spread out before us. It was practically virgin forest from the water's edge back over hill and dale as far as the eye could reach; smooth sand

beaches were to be seen at intervals along the shore, while almost straight ahead of us a bold promontory jutted out into the lake from the right shore, imposing and majestic in itself, but now made many fold more beautiful in the light of the setting sun, whose rays were just then breaking through the rifted clouds in the west. Peter said we could pitch our tent on the top of the promontory if we chose, and we did so, altho the task of getting tent, bedding, and the other camp necessities up the steep slope was no small one. However, the camp site proved ideal, and our cheery fire that evening must have been a brilliant and mystifying beacon for the beasts of the forest for miles around.

Next morning we were awake early, thanks to the peculiarly plaintive conversation of two loons out on the lake. Peter said if I wanted to visit one of the really best fishing and hunting sections of the State, as well as one of the most beautiful, he would take me across into Priestly Lake on our left and then overland to Chemquasabamticook Lake. I would have enjoyed the trip, no doubt, but I had not time enough to make it comfortably; and then, too, as I told Peter, "With such a name as that, I never could tell people where I had been." So we kept on down Umsaskis and into Long Lake. A little farther on we passed a large clearing on the left shore, with farm buildings. Peter volunteered the information that this was called Depot Farm, and that a great deal of hay and many vegetables were raised here for use in the lumber camps, and that splendid fishing and hunting were to be had throughout all the nearby district. "You come up here next fall," Peter added with greatest assurance, "and I'll take you in where you can't help getting a moose to be proud of."

Ten miles or so of paddling down the river brought up into Round Pond, which Peter said was the last pond or lake we would come to on the trip. Our course soon narrowed again to river width, and we found the current set in much more strongly from here onward. The next twelve miles of our voyage were quickly made, past charming stretches of wildwood scenery, the monarchs of the forest seeming to stand at "Attention" as we shot by them, and the soft breezes from the hills, laden with balsamic fragrance, whispering a welcome to us through the treetops. Then we came to a good-sized clearing on the left shore, with the usual accompaniment of farm buildings. We stopped here for the night, and found a most hospitable host and hostess in charge. They had but recently acquired the property, and were making plans for an elaborate home camp at the farm and nine outlying camps to be situated at advantageous points farther up the river and on the contiguous lakes. The home camp alone was to have twenty-one rooms, and cost $25,000. I have since learned that work on the buildings is already well under way, and the project has every assurance of success.

Two miles below this "oasis of civilization," which we found so charmingly located at one of the river's most picturesque points, we encountered Allagash Falls and were compelled to make use of the eighth-of-a-mile carry around this pitch. Below the falls our graceful "Betsy," thanks to the strong arm of Peter and to the swift current, made record time on the thirteen miles of river which led us to the St. John. At Con-

A Doe in Wading

nors Village, on the Canadian side, twelve miles below the confluence of the Allagash and the St. John, we found comfortable hotel accommodations and a genial party of tourists who had just come up from Fort Kent and were able to give us the latest news from the outside world. Next day it was an easy matter to slip down to Fort Kent, a distance of some eighteen miles. This last "lap" of our course was by no means an uninteresting one, however, since there were many prettily wooded islands to be passed *en route,* and a panorama of shore scenery which was ever new and never tiresome. When finally we reached Fort Kent we paddled down past the business section of the town, rubbing "Betsy's" dark red nose on the river bank only a few rods below the town's historic old blockhouse. From there it was a short distance to the railroad station with the canoe and camp kit, and an easy day's journey home.

While the Allagash trip is undoubtedly as attractive a canoe journey as can be found in all New England, there are several other particularly good routes among the labyrinthian northern Maine waters which are followed by vacationists every season. Prominent among these are the Penobscot West branch trip of about eighty miles, the Penobscot East branch trip of one hundred and eighteen miles, the Fish River and lakes trip forming a circuit of a hundred miles, the Allagash Lake trip of about a hundred miles, and the St. John River trip of two hundred and thirty miles. All of these routes take the voyager into the heart of Maine's wonderful forest land, where Nature has bestowed scenic, piscatorial, and game wealth with a lavish hand, and where, best of all, the blessings of an outdoor existence can be enjoyed in safety, and in full.

BANGOR, ME.

Slaves of the North

BY ELLEN PAINE HULING

ON the edge of the world, where the white dark broods and winds moan ceaselessly,
And there's never a law of God or man beyond the Fifty-three,
We toil for love of the grim white north and the good of our Company.

From the dank gray cliffs of the Cypress Hills to ice-locked Melville Sound,
And the swamps where musk-cows huddle and freeze in the desolate Barren Ground,
Where canoe will float or a snow-shoe scud, the men of our breed are found.

We trap the marten and beaver and fox when the winter nights flash long,
We run on the trail of the caribou, with each dog straining hot at the thong,
Or, failing, we starve,—with our face to the north, for the spell of the north binds strong.

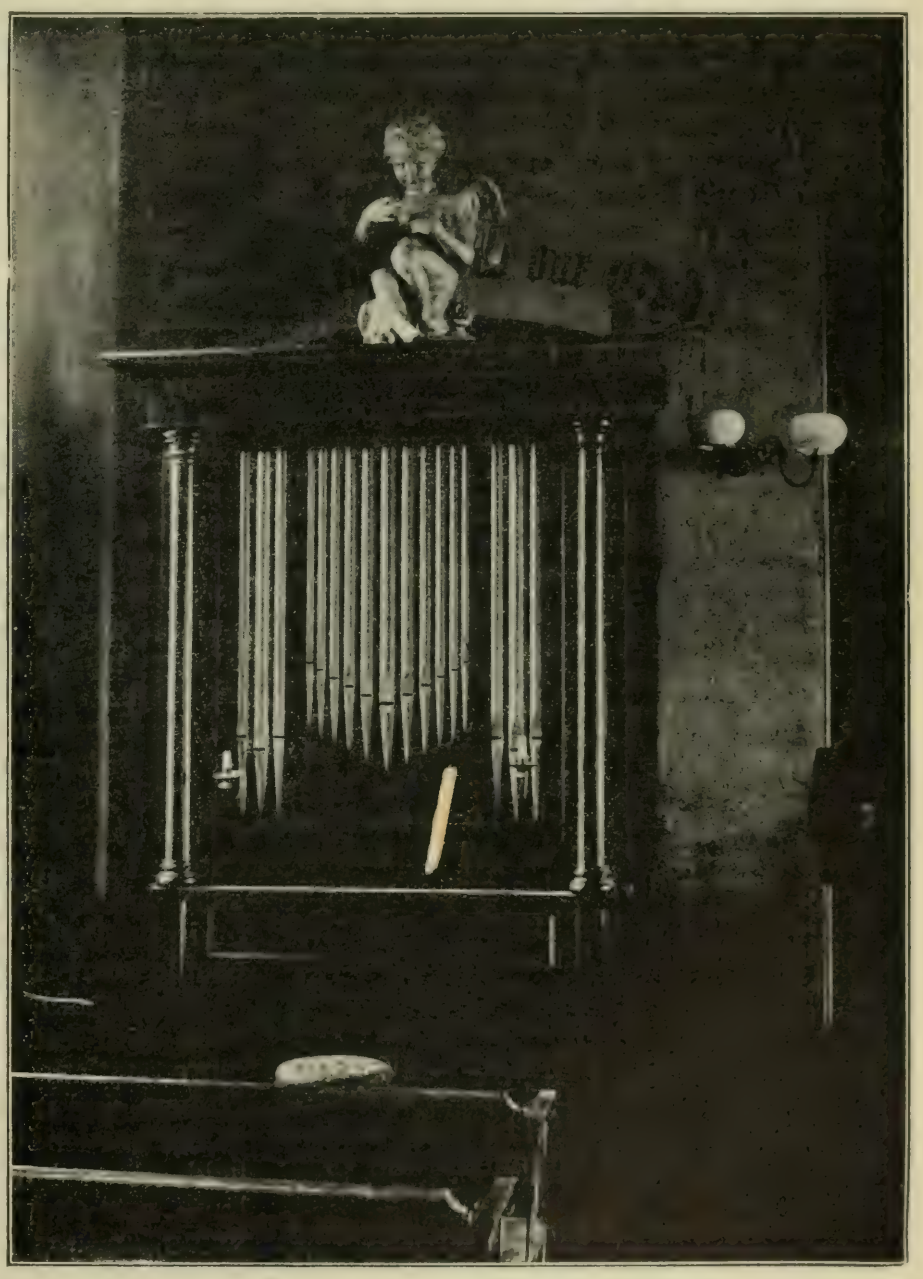
Yet at times, when the work of the day is o'er, in the glitter of Arctic night,
When our Indians sleep and their dogs still snarl round the circle of camp-fire light,
When above the north-lights crackle and flare, red, green, and ghastly white,

We dream of blue dusk on Laurentian Hills, where dim white birches sway,
And the hot scent of clover and rustle of pines as the north-wind sweeps from the bay,
And faint girls' laughter floats down from the hights above St. Irénée.

But the trail to the land of our youth is long, o'er the years and the trackless snow.
We are dead; shall the north give back its dead? and our camp-fire glimmers low,
And the north-lights flicker like ghosts of the hopes we dreamed once,—long ago.

For a thin white wind wails over the snow; we are called and we may not stay;
By its hunger, its dark and its uttermost cold we are slaves of the north for aye.
And here in the dusk at the edge of the world we toil till the Judgment Day.

CAMBRIDGE, MASS.



Literature

Music in America

THE title of Mr. Elson's book * is the first of many infelicities, for if such a thing as a distinctively American music exists at all, it is not of sufficient magnitude in the tone world to make up a "History" of nearly 400 big octavo pages. But the scope of this volume is much broader than its title indicates. Its eighteen chapters are so many accounts of the varying phases of musical activity in the United States from the days of the Psalm-singing Puritans to the present year of grace.

These accounts provide a surprising wealth of information about the religious beginnings of music in America, early musical organizations, American orchestras, folk music of America, national and patriotic music, American composers (in all kinds of music, from the popular song or march to the symphony and the grand opera), American performers and interpreters of music (of all classes), American women in music, the manufacture of musical instruments, musical education of the present, and even musical criticism; in short, the book is a great repository of more or less interesting facts, but those facts are set down without much regard for any discoverable order of arrangement, such as would be requisite for a clear and succinct record of the development of the country's musical activities.

While he glimpses hastily at Indian music, he holds that it interests chiefly the ethnologist and falls far short of forming a national folk-song. In the planta-

tion music of the South he finds greater promise of material for American composers. "It contains all the elements that contribute the power of folk-music in the old world." But he wisely points out that the exhilarating "rag-time" which many suppose has proceeded from this source, must be cleared away before a true use can be made of the plantation music as a folk-song foundation.

Gratification is expressed that America has long had an able band of musical critics and authors, and that sentimentalists have never headed their ranks. He says the excess of piano playing is "the chief fault of our musical system," and laments the lack of "real music at home such as one finds in Germany, in Bohemia, in Hungary, in all deeply musical countries—*ensemble* music, violin, voice, flute, piano and other delightful combinations." And American composers he warns against characteristic faults: haste and love of bigness.

Country Living

*Liberty and a Living** was published some fifteen years ago, and now appears again, considerably enlarged and revised, but under the same title. It is the work of Philip G. Hubert, a New York writer, who undertook to prove that one could cut loose from town drudgery, live in the open country, get good health and good air and good food, and do his corresponding for newspapers and magazines just as well. Mr. Hubert discusses his new home, his garden, his sports, his bees; and does everything well. The story is not overdrawn, is suggestive and helpful. By liberty and a living he means getting bread and butter, clothes and shelter for his littles ones and himself, by the exercise of common skill in gardening—adding on the fun of outdoor sports. It is the story of a very simple struggle to get a chance at God's sunshine, and escape the grind of city life. The book has the great advantage of simplicity and plain statement.

The Fat of the Land† is another book which undertakes to give advice to the tide of people now moving countryward. The book contains a great many bright things, and some helpful statements. If one were to open at the closing pages, or again at the introduction, he would find so much of honest countryman wisdom that he would be likely to commend the book. It tells us "If the unborn would heed my advice, I would say by all means be born in the country—in Ohio, if possible. But, if fortune does not prove as kind to you as I could wish, accept this other advice: choose the country for your foster mother—go to her for consolation and rejuvenation; take her bounty gratefully, rest on her fair bosom, and be content with the fat of the land." Unfortunately, however, the author, Mr. John Williams Streeter, seems to have had in view the making of a book which should fetch the public. The result is a hodge-podge of stories, experiences, farm work, travels,—with an immense flourish of figures. He represents his book as descriptive of "intensive" farming. It goes rather to the other extreme, and portrays the work of a man who handled his money by the tens of thousands. How many of those people who are now working outward from the cities do you suppose could afford two pig-pens each worth over $20,000? His horse barn cost $2,000, his forage barn $3,400, his granary $2,200. Of course, no such enterprise as this can be undertaken by one person out of a thousand of those who are trying to escape the narrowness of city life. It would be very unwise to advise inexperienced people to undertake any such large enterprises in the way of land tillage and animal culture.

The fact is we are still waiting for the one simple, straightforward book that shall fall in with the tide countryward, and give it that sort of advice which will enable nearly every one to make a success of home-making in the country. Such a book will certainly come. It will be more statistical than the book of Mr. Hubert, and it will give expert testimony in the garden, in the orchard, and in the field. It will take the newcomer by the hand, and show him how he can make a living, and yet live happily—how he can win his bread among the birds and the bees, and the brooks, without losing his social and intellectual life with men. The new country life is not a life of isolation

* LIBERTY AND A LIVING. *By Philip H. Hubert.* New York: G. P. Putnam's Sons. $1.20.

† THE FAT OF THE LAND. *By John Williams Streeter.* New York: The Macmillan Co. $1.50.

or of narrowness. It takes in the rural telephone, free mail delivery, and the trolley. The author of the book that we are looking for will appreciate all this, and show us how we can have all the advantages of concentered town life, and yet live nestled on the sunny hillside, bowered in with our own gardens and orchards.

The Veil of the Temple

In these days, when traditional views of the Bible and morals have been shaken, and science has given us a world of new conceptions which we have not yet had time to assimilate to our ethical and religious philosophy, the greatest danger is that disturbed minds will seek shelter in temporary subterfuges, and be content with verbal plausibilities, rather than frankly recognize their difficulties and think them out as clearly and completely as they can. It is for this reason that we welcome Mr. Mallock's new volume of philosophic dialog,* in which he directs his brilliant dialectic against the numerous compromise positions now popular, and thrusts into the chinks of every man's armor. The book is not in itself an important contribution to philosophy, but there are few persons whose thoughts are so thoroughly synthesized that they will not detect by reading it an unsuspected flaw in their logic, or perceive a new drift in some favorite argument.

The framework of the book (which the publishers curiously call a romance) is that of the classical symposium. At a country house a group of men and women gather to discuss the present status of religion and ethics in the light of modern science, formally stated in three questions, first, how much of the Bible and Christian doctrine is in their old sense believable? second, what ground does science give for retaining those general hopes and feelings which all religions share as their common and inmost essence? third, if science does afford us a foundation for a religion of some kind, in what practical form can such a religion express itself?

An advocate of each form of faith and no-faith has his innings; the representatives of ritualism, of the "broad church" with its symbolic interpretations, of the liberal theology, of the religion of humanity, of natural religion, and of agnosticism present their cases effectively, and with equal vigor demolish each other's. Among the speakers, Spencer, Balfour, Henson and other well-known English leaders of thought appear in person or by proxy. After the ground has been completely cleared, and we have been successively deprived, if we accept all the author's argumentation, of our beliefs in the Bible, in the authority of the Church, in the obligations of the moral law, in the reality of the external universe, in the freedom of the will, and in the existence of our own personality, we are led "from dark to twilight," to the acceptance of

> "the three constructive mysteries—that life is more than it seems to be, that the will is its own master, and that man, when his will is strong, may compel a will yet stronger to lend him its own strength, and associate its sublimity with his."

The tenor and phrasing of the argument suggest that this book is to be followed by a sequel, leading from this dogmatic "twilight" into the open "daylight"—of Roman Catholicism.

The main argument on which Mr. Mallock bases this minimum of religious dogma is

> "that if it is an illusion, it is an illusion of such efficiency that it forms the most vivifying element in the civilized life of man, and that all human morality which is more than the morality of an ant-hill is radioactive with its recognized or secret presence."

In reading this book, however, we become so habituated to its methods of destructive criticism that we are inclined to question even its few pages of constructive argument, altho we would not dispute his conclusions. The history of science shows that the practical value of a hypothesis is no proof of its validity. Land surveying and geometry were developed on the theory that the earth is flat. All the laws of the reflection and refraction of light by mirrors and lenses were worked out on the hypothesis that light is composed of small particles of matter. If the only certain proof of the truth of religion is its usefulness, as Mr. Mallock apparently holds, we do not think that he

* The Veil of the Tempie; or, From Dark to Twilight. *By William Hurrell Mallock.* New York: G. P. Putnam's Sons. $1.50.

has placed it on any solider foundations than those he thinks he has taken away.

But we are indebted to any one who discusses so clearly and fearlessly the burning questions of the hour. Mr. Mallock's epigrams at least will serve to disturb the slumber of the *semper-idem* conservative, and to prick the self-satisfied equanimity of the chronic compromiser. There is now both need and opportunity for a new apologetic; not defensive, not offensive, but constructive and assimilative. Such work is being attempted in France by Loisy in the Catholic and Sabatier in the Protestant Church, and we need men of like spirit and intent in our own churches.

Getting Acquainted with the Trees. By J. Horace McFarland New York: The Outlook Co.

While not a strictly scientific book, certainly not a botanical disquisition, this book is one of the most useful that has recently been offered to the reading public. In fact, Mr. McFarland is a first-class tree-lover and tree-observer.

"In the spring time, when the rising of the sap incites some to poetry, some to making maple sugar and some to watching for the first flowers, he considers the possibilities of a peaceful hunt, that can be made either in a city street or along country roadsides to find the beautiful."

Lombardy Poplar. From "Getting Acquainted with the Trees." (The Outlook Company)

He has discovered that the flower of the maple is one of the most beautiful of all the flowers that adorn spring. This is especially true of the silver maple, and most of all of the water maple. The leaves of the red maple—it is the swamp maple of some localities—as they open to the coaxing of April sun and April showers, have a rich, red hue, touched with soft yellow bronze and apricot. Mr. McFarland does not confine himself to a discussion of our more common native trees, but shows his true nature love by getting acquainted with those that are neglected. Specially pleasant are his notes on the nut-bearing trees:

"All these nut trees are only members of a great family of trees given by God for man's good; for man first comes into view in a garden of trees, while the city and the plain are penances for sin."

He has often visited the old beech trees, which shook down their nuts upon him in his childhood, simply to refresh his life and renew his grip on boyhood. The pure American beech is a tree that always wins its way into the heart of a native. It has a neighborly way about it, and wholesomeness that induces one to throw himself on the sod beneath, or, in the fall, to kick about the sweet-smelling leaves that have fallen with the nuts. How many of Mr. McFarland's readers will understand his notes on two of our most neglected but really characteristic fruits? He thinks that most of his readers know something about the banana-like fruits of the paw paw—four or five inches long, green outside, but filled with a soft and sweet aromatic yellow pulp. It is the very handsomest and most distinct small tree, with decidedly odd flowers, to be found in the American flora. It is found in shady places and river bottoms as far north as Michigan. The leaves are very similar to the persimmon, another American fruit which has been shamefully neglected. The botanical name is diospyros, which may be translated as "fruit of the gods." If greedily eaten before ripe they are astringent beyond all power of language to describe, but after they are perfectly ripened per-

simmons are among the most delicious of fruits. In every way this book is worthy of a kindly welcome. Its illustrations, from photographs taken by the author himself, are delightful art.

The American Natural History. By William T. Hornaday. New York: Charles Scribner's Sons. $3.50.

Those amateur naturalists who believe with their professional brothers that the everyday life of *uninspired* animals exhibits much that is interesting, and even dramatic, will find great satisfaction in this work by Professor Hornaday. The author's long acquaintance with animal life in the higher classes, as a patient observer, has given him a position of authority held by few naturalists in the country. In size the book may seem a trifle forbidding to young people of fourteen or fifteen, for whom it is intended primarily, but if they will only open it anywhere beyond the preface and introduction the chances are that those objectionable features will never trouble them at all. The size was inevitable, because the author had so much to tell about; but the preface, with its relentless opinions, and the introduction, with its formidable array of definitions, are features that are likely to antagonize those who differ as to the opinions, and also those who do not care for the definitions, just then. The scheme of classification on the first page of every chapter possibly was of more use to the author in paragraphing his manuscript than it is likely to be to the young reader. Few boys or girls are attracted by the tabular scheme of information. Putting aside these more or less techincal objections the fact remains that the book is a great and valuable collection of truth about the appearance and habits of creatures with which we should all have better acquaintance. There are many facts about animals that are not interesting to young people unless there is some charm in the telling. If the dry facts are mingled with the inherently interesting facts with simple skill, the young person's natural craving for exact and complete information is agreeably satisfied. Not the least of the valuable qualities of Professor Hornaday's book is the attractive presentation of all the essential facts concerning the species of mammals, birds, reptiles, amphibians and fishes which he has selected for description. The volume is well illustrated with drawings and photographs.

From Hornaday's "American Natural History" (Scribner's)

Descartes and Spinoza. By Professor Iverach, D.D. New York: Charles Scribner's Sons. $1.25.

A volume in the series of the World's Epoch Makers which the student of the history of philosophy will find worth consulting. It is not easy reading, particularly the part of it that deals with Spinoza. This, however, cannot be charged against the author, since Spinoza, even in paraphrase, does not permit easy intelligibility. The book gives the historical setting and, also, a sympathetic and critical presentation of the philosophy of Descartes and Spinoza. The relation of the system of each to the philosophies that preceded and followed them is clearly shown. The gaps in Descartes's thought by which he be-

came at once father of modern materialism and of modern idealism are pointed out. His anticipations of later thought are developed. A summary is given of the thought of Spinoza's principal treatises. The failure of his system to reckon adequately with experience is emphasized, but not without recognition of the permanent value of his thought.

Isopel Berners. By George Borrow. Edited by Thomas Seccombe. New York: Dodd, Mead & Co. $1.00.

The lovers of Borrow are born, not made, and if one wishes to test his congenital qualifications for joining their circle he can do no better than to read the adventures of Lavengro in the dingle as presented in this volume. If he does not relish the fight with the Flaming Tinman, the debates with the Papish Spy and Isopel's lessons in Armenian, he need follow Borrow no further, no matter how humiliated he may be that he is not able to show the enthusiasm of his friends for the vagrant philologist. The introduction gives a very good account of the life of the author and his attempts at truthful autobiography.

Collected Verses. By Alfred Cochrane. New York: Longmans, Green & Co.

This is an exceptionally good collection of light and occasional verse.

"Herein are neither 'dancing stars,'
Nor epic hymns of Life and Time:
No Love, no Death, no 'giant wars,'
No measures lofty or sublime. . . .

"[But] country life, serene and sweet,
A respite from the dust of town,
The straggling, red-roofed village street,
The wind that pipes across the down.

"Rose gardens, wet with morning dews,
And April blackbirds in the lane,
Gray churches, hid amid the yews,
With saints and shields upon the pane.

"Then the old customs, lingering still,
Amid the world's untrodden nooks,
Old faiths, old fashions, if you will,
Old prints, old bindings, and old books."

A thorough simplicity of thought and versification, a pensive, reminiscent mood, a vein of quaintness, a touch of old-fashioned sentiment, a mild philosophic detachment from the immediate present, and a tendency to look at life through the spectacles of the past—such are the chief characteristics of these agreeable verses. Their humor, for the sum of all these qualities makes up a kind of humor in itself, is perhaps less American than English. It consists neither in the extravagance of the idea or of the statement, nor in the sudden disclosure of some violent absurdity, but rather in a sort of ambiguous balance between jest and earnest, together with a good natured conviction that there is at bottom very little to choose between human folly and a great deal that passes for human wisdom.

The Iberian. Anglo-Greek Play. By Osborn R. Lamb. With music by H. Claiborne Dixon. New York: Ames & Rollinson Press. $2.00.

Old attempts to write Greek plays in English were never conspicuous for success. Nor is this one. Its plan (plot is a term it hardly deserves) is of the slenderest. The antique form has been followed in the unities of time, place and theme; and chorus and semi-chorus are employed for interludes of song. The conceit, as our forefathers would have called it, is rather daintily pretty in outline, and in the hands of a poet something beautiful might have been made of it. But the idea is somewhat crudely handled and the author's verse, while sufficiently varied in meter, is for the most part decidedly commonplace. H. Claiborne Dixon, a young English composer, has furnished incidental music, including a prelude and three choral hymns, which appears from the pianoforte arrangement printed with the play to be of about the same order of merit as Mr. Lamb's verse. It does not call for extended comment.

Dictionary of Contemporary Quotations (English). By Helena Shaw. New York: E. P. Dutton & Co. $2.50.

Those who wish to renew their stock of quotations will find this book valuable for that purpose, and any reader will enjoy looking it through. There are some 5,000 quotations from British and American poets included, arranged topically, and well indexed. The word

"contemporary" is liberally construed to include any poetry written since 1850, and even before. Every reader will wonder why some verses are included and why some are not, but the same objection could be raised against any quotation book, even one of the reader's own compilation when he reads it over after many years.

The Mystic Mid-Region. The Deserts of the Southwest. By Arthur J. Burdick. New York: G. P. Putnam's Sons. $2.00.

During the settlement of the West the first inhabitants of the country beyond the hundredth meridian considered it an insult if the term "arid" was applied to the region, and they indignantly denied that there was any American desert, great or small. Nowadays this feeling is quite overcome and the arid region takes pride in its climatic conditions and its peculiar flora and fauna. Mr. Burdick, altho in literary style he does not rise above the level of ordinary journalese, gives an interesting account of Death Valley and other Southern deserts, illustrated by excellent photographs of cacti, Mojave Indians, horned toads and the like. The book suffers by comparison with Van Dyke's poetical description of the same region. It is a miscellaneous collection of uncritically gathered information.

One of the Desert Bloomers
From "The Mystic Mid-Region" (Putnam's)

The Viking's Skull. By John R. Carling. Boston: Little, Brown & Co. $1.50.

This is a novel of the old-fashioned sort, as full of romance as of unreality. The stage-properties are a "runic ring," descended from the Druids, or even from Odin himself, and a skull supposed to be that of "Orm the Golden," a Viking ancestor of the house of Ravengate, whose fortunes we follow through the pages of the story. The hero, Idris Ravenger, promptly falls in love with the heroine the moment their eyes meet, and from this point on there is more than enough melodrama to satisfy the most exacting reader. A *mélange* of Norse legends and rimes, hypnotism, phrenology, archeology, a divining-rod, old tapestry, an ancestral requiem, modern characters, an earthquake, two or three murders, a shipwreck, things 2,000 years old and things of to-day—this is a dainty dish to set before the novel lover and it will tempt his jaded appetite for marvels.

A Narrative of Medicine in America. By James Gregory Mumford, M.D. Assistant Visiting Surgeon to the Massachusetts General Hospital and Instructor in Surgery in the Harvard Medical School. J. B. Lippincott Company, Philadelphia and London, 1903. $3.00.

This is not a systematic history, but a narrative of medicine and doctors. In thus avoiding the dry details of supposed medical progress and the reactionary phases of medicine, which have but little of interest for the general reader Dr. Mumford has succeeded in making an extremely readable book. Very few people will fail to find it almost as attractive as fiction in many parts, and it has all the commanding interest of good biography. Those who are inclined to think that the predecessors of the present generation of physicians and surgeons were at all unworthy of our great enterprising American Republic will find in this story a complete contradiction of such a notion. With regard to the physicians and surgeons of a century ago, the author says:

"Two things about all these men and about their disciples and followers are continually salient, their daring and their ingenuity—traditional American traits. As Billings says, they may not have contributed many great things to the sum of human knowledge, they may not conspicuously have advanced science in the narrow sense, nor devoted themselves to experimental research—those are the deeds and pursuits of a wider and more leisured civilization, reserved in our country for modern times and the twentieth century; but they did show the world how to apply the knowledge at command, that desperate cases need desperate remedies, and that theory avails little without the courage to put it into practice. So we must think of those early years as producing men of unusual resource, ingenuity and courage; the best of them well educated and putting into service the best teaching of the Old World."

The lives of such men as Rush, Drake, Ephraim McDowell, who, in the back woods of Kentucky, did what the best surgeons in Europe thought impossible; of Warren and Jackson, of Physick and Chapman, and the men whose names are forever associated with the introduction of ether as an anesthetic, besides Bigelow and Smith and Francis and David Hosack—all these represent details of the history of medicine that must prove not only a source of interest but of lively emulation for the physicians of many generations to come here in America, if they would be worthy of the great generations that have preceded them.

Bismarck's Letters to His Wife. New York: D. Appleton & Co. $1.00.

In the large volume of *Bismarck's Letters to His Wife,* published several years ago, the period covered by the Franco-Prussian War was but partially covered. Recently a member of the Bismarck family found the missing letters in a locked casket among the late Countess's effects, and in May of this year they were given to the publishers for the first time. At least there can be no doubt as to their authorship. They show the same devotion so noticeable in the former volume to that very simple minded, somewhat peevish lady whom he delighted to call his "liebes Herz." At the same time there is the print of the war hoof on every page, reddened with the blood of Frenchmen, whom he so cordially despised. Indeed, that is the feature of this collection, his contempt for the French, and his impatience at the delay of the Prussian Commander before the gates of Paris. The admirers of Bismarck will find much to entertain them in this small volume.

Handy Reference Atlas of the World. Edited by J. G. Bartholomew. New York: E. P. Dutton & Co. $2.50.

The reader who has handled this volume, which measures only 7½ by 5 by 2 inches, will lose faith in the convention that an atlas has to be so big and unwieldly as to require a derrick to use. He remembers how many times he has read over passages in historical or the daily news with only a vague idea of their meaning, simply because to look up the geography of the localities referred to would have required a gymnastic feat for which he was disinclined. The information to be got from a map depends more on distinctness and delicacy of printing than on the size of the page, and the maps in this little book are so well printed that they contain a surprising amount of detail. There is an excellent index, many geographical tables, and numerous plans of cities. Since it is an English publication, the British Empire is given a larger proportion of space than an American reader desires.

Literary Notes

DR. HERTER'S Address on "The Influence of Pasteur on Medical Science" is printed by Dodd, Mead & Co. ($1.00).

....Captain Hains, whose sea stories have often interested the readers of THE INDEPENDENT, published in *Success* for June the narrative of a personal adventure of himself and wife in a small boat off Cape Hatteras.

....Ritualism is undeniably growing, and even those churches which had their origin in the opposition to such ecclesiastical forms are now adopting them. The Pilgrim Press (Boston) publishes a small volume containing prayers, litanies and simple liturgical services, especially for use in Congregational Churches.

....The danger of the spreading of disease by mosquitoes is now thoroughly demonstrated and many localities are taking active measures to protect themselves. The Report of the General Convention to Consider the Question of Mosquito Extermination, published by the Brooklyn *Eagle*, gives the most recent information on this topic.

....Parliamentary rules are like revolvers; they are of no value unless they are handy. Howe's Handbook of Parliamentary Usage, published by Hinds & Noble (New York, 50 cents), is very ingeniously arranged, so any ordinary question can be instantly decided in the heat of debate ,and in time to rise on a point of order before the chance has passed.

....Mr. Charles Keeler's essays on "The Simple Home" (Paul Elder, San Francisco, 75 cents), are written especially to suit Californian conditions, but the advice he gives as to how a home can be made artistic, harmonious and beautiful in architecture, furniture and decoration will be appreciated everywhere.

...."The Lighting of School-Rooms," by Dr. Stuart H. Rowe (Longmans, Green & Co., $1.00), should be read by all who have the construction and planning of school-rooms. The numerous ground plans and illustrations give a clear idea not only of model buildings, but of methods, such as the use of prism glass, by which the disadvantages of a poor location can be remedied.

....A new volume of "The Messages of the Bible" series of commentaries, edited by Professors Sanders and Kent (Scribner's, New York, $1.25), gives the "Messages of the Psalmists, the Psalms of the Old Testaments arranged in their natural grouping and freely rendered in paraphrase" by Prof. John E. McFadyen. The ordinary reader will get from this version a new light on many obscure passages, and will have brought to his attention many beauties that he has overlooked.

Pebbles

"DON'T you think he's as ugly as sin?" "No; as virtue."—*Life.*

...."That makes a difference," said Willie, snipping off the left ear of one of the twins.—*Harvard Lampoon.*

....*Mr. Critique:* "Yes, indeed, my house is simply full of Titians." *Mrs. Nouveauriche:* "Good gracious, ain't there no way of killing 'em?"—*Princeton Tiger.*

....*Jig:* "I just heard a hair-raising story in the smoking car." *Mrs. Jig:* "Mercy! About ghosts?" *Jig:* "No, a rabbit farm."—*Princeton Tiger.*

EXTRACTS FROM FRESHMAN'S REGISTRATION BLANK.

Name of Father? John Smith. Father's Occupation? Wholesale Fuel Merchant. Father living? No.—*Chaparral.*

I'm glad I'm livin' nowadays,
For I have heard it said,
That tho we earn our living, now,
The Romans urned their dead.
—*Yale Record.*

PROBABLY IT WAS A WALL STREET BULL.

A local butcher, while killing several cattle, came upon one steer which offered not the slightest resistance to his execution. After the animal was cut up it was found it had eaten a copy of W. J. Bryan's *Commoner.*—*Pittsburg special to the New York Times, May 15th.*

....When you call at a house where there has been a death, and the hostess asks if you care to look at the body, is it proper to refuse? And if you accept, what is the proper comment? "He looks natural," is old and commonplace, and doesn't indicate anything comforting. "He looks handsome," is probably a lie. Would it be very rude to refuse to look? The books are full of etiquet regarding weddings, receptions, Dutch lunches, church socials and picnics, but there is no guiding star for conduct at funerals.—*Atchison Globe.*

THIS TIME NEXT YEAR.

The lid has been off now since last November.

Mr. William R. Hearst's allowance has been stopped.

It is said that the St. Louis Fair deficit is not nearly as large as was first reported.

A negro lynching took place yesterday on Beacon Street, Boston, just opposite the Common. Et tu, Massachusetts!

Mr. Bryan is offering a 97-piece dinner set with every subscription to *The Commoner.* Send for list of other premiums.

Experts are unanimous in the belief that the first great action of the Eastern war on land cannot be much longer postponed. The Yalu, to date, has been crossed thirty times.
—*Puck.*

Editorials

The Office of Vice-President

In filling the second place on a national ticket, party leaders have usually been guided by several arguments and influences which we shall briefly consider. First, if the successful candidate for the Presidential nomination is an Eastern man, his partner on the ticket is sought in the West, and *vice versa*. In making this geographical apportionment the South has for many years been excluded. One has only to recall the tickets of the last quarter of a century to see how this rule has been observed. It is suggested by common sense and a knowledge of human nature. As there is a tendency to find the nominee for first place in some great State (East or West) where neither party can always be sure of a majority, and where the candidate's personal popularity and influence may turn the scale, so also in filling the second place political leaders are wont to study carefully the material and the conditions to be found in States that may be essential and as to whose vote there is room for doubt. Of course, the fitness, experience, and "availability" of men are by no means overlooked. Sometimes, when well-defined factions exist in a party, that one which has been defeated in a contest for the first place is permitted to take the second. The Garfield and Arthur ticket was an example of such an apportionment of honors, designed to restore harmony. Similar agreements have been reached when there was no sharp factional division, but after a sectional contest over the first place.

At the present time the Republican party naturally seeks a candidate for the second place in the Middle West, and preferably in Illinois or Indiana, owing to the weight of those States in the final count, and the possibility that one or both may be lost. In 1896 and 1900 the Republican plurality in Illinois was large, it is true; but in 1892 there was a Democratic plurality of 27,000, and for some years before that time the Republican margin had been small. If the Democracy is to be "sane and safe" this year, the Republican party will deem it expedient to utilize all possible local advantages. This explains in part the demand for Mr. Cannon and the movement for Mr. Hitt. Indiana, for many years a doubtful and almost evenly divided State, supported the Republican ticket by small pluralities in the two Bryan campaigns. Here, again, it is expedient for the party to excite local enthusiasm and appeal to State pride. This accounts in part for the prominence of Senator Fairbanks among those mentioned for the second place.

In all probability one of these three gentlemen will be nominated. Other strong men in the Middle West will not be considered, because they reside in States whose loyalty to the party at the polls is beyond question. We believe that Mr. Cannon is absolutely sincere when he says that he does not want the nomination or the office. In a political sense, however, his nomination would be an ideal one, not only because of its effect in Illinois. But there are other men better fitted by temperament and inclination to preside over the Senate. Mr. Hitt is admirably equipped for the office, except with respect to age. He has already passed his seventieth birthday. If he should be elected, he would take office at the age of 71, with four years to serve. The Vice-President stands as a possible substitute for his chief; he should be qualified by physical vigor to take command of the Ship of State with a firm hand in any emergency. The Speaker is just 68, but really much younger than his years. The nomination of Mr. Fairbanks would promote the success of the ticket in Indiana; that of Mr. Cannon would exert a similar influence there, for the Speaker's sterling Americanism is admired far beyond the boundaries of Illinois. Unless the Senator's attitude has recently undergone a change, he desires to avoid a nomination. Either Roosevelt and Cannon or Roosevelt and Fairbanks would be a strong ticket.

We shall not be surprised if the Speaker is confronted in the convention by a practically unanimous nomination, which he will not be permitted to reject.

On the other side the Vice-Presidential problem is a more complicated one. If we assume that Judge Parker is to have the first place, then the party will go westward for his associate. This would also be its course if the nominee for President should be Mr. Cleveland, Mr. Gorman, Judge Gray, Mr. Olney or Mayor McClellan. In all probability the first place on the ticket will be held by Judge Parker or some other Eastern man. The party has in its ranks no one of greater promise than John Sharp Williams, of Mississippi, its new leader on the floor of the House, a man of tact, judgment, good humor, and broad education. But the time has not come when it can afford to place on its national ticket a resident of Mississippi. And if Mr. Williams were representing an Indiana district in Congress his usefulness in the House might prevent any consideration of his name for the Vice-Presidency.

Neither in Illinois nor in Indiana can we see the coming Democratic candidate for the second place. Indiana offers no one; in Illinois, Mayor Harrison appears to be excluded by reason of local conditions; of the Mayor's own choice, Congressman Williams, the country knows nothing. Mayor Tom L. Johnson, of Cleveland, is not in agreement with the conservative element and could not obtain the support of his State. Even if the party could be induced to look about for a candidate in the safe Republican States of the Upper Mississippi Valley, it would find no one looming up there. Ex-Senator George Turner, of Washington (some years ago a Republican) has been named by the Democrats of his State, but the party will not take a man from the Pacific Coast.

The Democratic nominee for second place is not yet in sight in the West, unless his name is Folk or Francis. Missouri is a safe Democratic State, but the young Prosecuting Attorney of St. Louis (soon to be elected Governor) is known and admired throughout the land. For political purposes he might be called a resident of every doubtful State in the West. No Democrat of Indiana or Illinois could do more for the party in those States. But Mr. Folk is very young. He will not reach the constitutional age of 35 until one week before election day. He does not profess to be familiar with national questions, and he has repelled all suggestions looking to his nomination, saying that he desires above all things to be Governor of Missouri, and that it is his duty to satisfy the just expectations of his friends by devoting his energies exclusively to the work of that office. Mr. Francis has been Governor of the same State, and Secretary of the Interior, and is now President of the Louisiana Purchase Exposition. We shall hear more of these gentlemen, but Mr. Folk's age, like Mr. Hitt's, is ground for objection. A man of 35 years will not be nominated, we think, to preside over the venerable Senate.

If by some chance the first place should be given to a Western dark horse, the East would offer a large group of persons available for the other place; but it is now extremely improbable that such a change will be made.

The office of Vice-President is one that no aspiring American can afford to reject or avoid. Some have said that public men of promise can be shelved in it. The most notable attempt to shelve a man in the Vice-Presidency was unsuccessful. Any American prominent in public life who strives to avoid this office because he fears it will prevent him from reaching the only one that is higher, will probably have reason to regret his action.

A Week of Church Union

MAY and October are the sacred months of the year, chosen for Church convocations. And as this is the era of union, plans of Church union have been the principal topics of discussion. The advance has been positive and hopeful.

First, the plans proposed for establishing a permanent Federation of Churches make happy progress. The first great meeting in this city in October of next year is already assured. The Methodists in their General Conference have given their adhesion and made provision for fifty delegates, and the Baptists and Presbyterians have done the same. The Southern Methodists gave their adhesion last fall, and the African Methodists and a number of other denominations have since fallen in line. We may expect that

all, or nearly all, our Churches will be represented; so that what remains is to carry out the plans under the experienced lead of Dr. W. H. Roberts, of Philadelphia, the Chairman of the committee in charge.

An even closer federation has been advanced between three denominations by the hearty approval by the Methodist Protestant Conference at Washington of the plan looking to closer relations between that body and the United Brethren and the Congregationalists.

But the principal interest has centered in the decision of the question of union between the Northern Presbyterians and the Cumberland Presbyterians. The General Assembly of each Church has this last week approved the union by the required two-thirds majority, which will send the question down to the several presbyteries for ratification. On the theological side, which was that mainly presented and considered, the action of the two Assemblies was superbly right, altho Princeton, as usual, managed to place itself utterly wrong. The objection to union put to the front was that of theology, a philosophy of decrees, with which men have no practical concern; an objection raised against the close fellowship of Christians, with which we have much concern; a conflict of ritualistic speculation against the essence of Christianity. But on this subject, which distracted men's minds a century ago, saner views now control, and the present-day Christian feels that he has no war to wage with other Christians on the technicalities of supra-mundane metaphysics. So we say that, considering solely the theological question involved, the question that was chiefly in discussion, the Assemblies decided superbly right.

But there was another side, a moral side, to be considered, and on that side we fear that the question was decided utterly wrong. A condition to union was required by the Cumberland Presbyterians, which was that on request of either race the ministers and churches representing it might separate from those of the other race, so as to have in the same State a white synod and presbyteries and also a separate synod and presbyteries for colored people. This was at the demand of the white people, who refuse to have religious association and equality with negroes. Now this is not a matter of theology, but of Christian morals. To mere theologians a moral question may be of small account, but it massed large in the teachings and practice of our Lord. He had little or nothing to say about prevenient election and grace, but much to say in parable and precept about brotherhood. He did not shun the Samaritans and the publicans, who were the despised castes of his day. He took great pains to teach that they were not to be shunned or separated. Now there is no secrecy about the purpose of this stringent condition. Its purpose is to shut out the negroes as unfit to associate in presbyteries with white people. Its purpose is absolutely unchristian. It divides brethren, not for convenience, but for prejudice; not for the benefit of a race, but out of despite to them. It is not expected that the colored men will ask for the division until they have been badgered into it and told that they are not wanted. They will be assured that it will be better for them, that they will have larger representation if they are by themselves; and by wheedling and crowding they will, it is thought, be persuaded to ask, as a favor to themselves, that the separation may be made which their prouder brethren want; for how can the Northern Church grow in the South, in its rivalry with the Southern Presbyterian Church, except the negro churches can be set off by themselves after the fashion there prevailing?

Church union is a means to Christian fellowship, but if Church union is made a means of reducing Christian fellowship we would have none of it. It is no sure proof that a man is a Christian that he wants Church union—it may be out of ecclesiastical pride—but we have concern for a man's soul who will discriminate against his brother in the Church of God because he is black. So let union perish rather than principle, for which the Presbyterian Church has stoutly stood through all its history. No influence could persuade the Episcopal Church to set off its negroes into black dioceses, and cannot the Presbyterian Church be as Christian as the Episcopal?

But the question now goes down to the presbyteries, and it is to be voted by them

whether they choose to learn the lesson taught at the well of Samaria to the disciples, who marveled that their Master consorted with Samaritans. We make no prophecy as to the vote of the presbyteries, for public temper is just now in aphelion from Christ's Samaritan doctrine; but this we say, with all seriousness: If union should be approved, with its condition of separate presbyteries, let no colored churches be crowded or wheedled into the mistake of asking for separation. Let them make no consent to caste division. Put that responsibility on the other side and stand firm. But we hope the whole subject may be sent back to the committees for amendment of the basis.

Of the assured union of a small detached Presbyterian denomination with the Northern Church we need not speak, nor need we dwell on the very happy approaches of the Northern and Southern Presbyterian Churches. It is with the greatest regret that we are compelled to disapprove of a condition attached to the most desirable union of the Northern and Cumberland Presbyterian Churches.

For what says the Scripture? Something of this general tenor:

"My brethren, have not the faith of our Lord Jesus Christ, the Lord of glory, with respect of persons. For if there come unto your General Assembly a man with white skin and straight hair, and there come also a black man with kinky hair, and ye have respect to him that hath the lighter skin, and say unto him, Sit thou here in a good place; and say to the other, Go thou out of my sight into a separate presbytery, are ye not partial in yourselves, and are become judges of evil thoughts? Harken, my beloved brethren, hath not God chosen the despised of this world, rich in faith and heirs of the Kingdom? If ye have respect to persons ye commit sin, and are convicted of the law as transgressors. So speak ye, and so do, as they that shall be judged by the royal law of liberty and equality."

This is the old rebuke that rings down the ages, and we commend it to the presbyteries. Do they dare this condemnation?

Ideas and Feelings as Social Forces

DOUBTLESS most readers of the letters by Herbert Spencer to American friends, that have been appearing in THE INDEPENDENT, have been chiefly interested in the rejoinder to Henry George's attack upon the "Perplexed Philosopher." We hope, however, that this interest has not made them overlook or fail to reflect upon the letter to Mr. Skilton in which Mr. Spencer set forth his views upon the question whether the course of things in human society can be changed by teaching. He says:

> "Everywhere I have contended, and I contend still, that feelings, not ideas, determine social results,—that everything depends, not upon intellect, but upon character; and character is not to be changed in a day or in a generation."

Like all great men, Mr. Spencer sometimes wrote half truths.

Undoubtedly certain brilliant social theories have had little appreciable effect upon the course of human progress. Plato theorized, Aristotle analyzed and explained. Society remains much as Aristotle described it; it has made little advance toward the ideal justice that Plato conceived; and that advance has been achieved by other means than those that Plato prescribed. The fate of many other theorists has been not very different.

The causes of great events, when we are able impartially to look back upon them, are found chiefly in instincts and feelings. For example, few momentous wars have been deliberately waged in the attempt to realize a political theory. More often have nations "drifted" into war, only half aware of what they were fighting for. Even the noteworthy exceptions, as, for example, the Franco-Prussian war that Bismarck planned with such consummate skill as to make it appear like the deliberate work of Louis Napoleon, have been more apparent than real, because the instigators have been compelled to await the "psychological moment," as we have learned to call it. Japan and Russia have been contemplating war for many years, and planning for it. Yet the real causes of conflict

have lain in the antagonistic interests, sympathies and ambitions of the two peoples.

Nevertheless, ideas are true causes of social change, and the teacher of sound social doctrine is not in the long run uninfluential. Marvelous as was Mr. Spencer's grasp of psychological principles, there is a phase of social psychology that he did not quite appreciate. There is practically nothing in Mr. Spencer's "Psychology," "Sociology" or "Ethics" explanatory of the phenomena known nowadays as "suggestion" and "suggestibility." The investigation of these processes has fallen to the lot of younger men. Ideas and feelings do not dwell apart in thought-tight compartments. They mingle in infinitely varied combinations, and in a thousand subtle ways ideas determine the complexes of feeling, strengthening some elements while inhibiting others. This is the profound truth so brilliantly set forth by the Frenchman, Alfred Fouillée, in his "*Psychologie des idées-forces,*" a work that should be better known than it is to social teachers.

Had Mr. Spencer ever made a detailed study of some one characteristic instance of collective mental action, let us say, for example, a great revival movement, or the anti-slavery agitation in the United States, he would have learned that the secret of it all lies in the relation of certain inciting ideas to vast stores of feeling, and especially in the power of ideas to act selectively upon feelings, awakening some to resistless activity while subordinating or extinguishing others.

This is a truth that the social teacher, the leader, the reformer as distinguished from the mere theorist, should master. A social theory as such, so long as it remains a purely intellectual product, has no influence whatever upon the course of events, but let it be converted into a few suggestive ideas, and so presented to the multitude as to awaken feeling, it may transform the whole face of society. Free trade as presented by Adam Smith in "The Wealth of Nations" was a theory only. Presented on the platform by Richard Cobden and John Bright as a concrete suggestive idea it revolutionized the policy of the British nation. The "Social Contract" of Rousseau was a doctrinaire book, but its vital ideas, translated into popular phrase by the Jacobins of France, and by Jefferson, Jackson and Lincoln in America, have created modern democracy, including an amazing development of voluntary organization.

The true social teacher is an intermediary between the theorist and the people. If he knows his business he grasps the fundamental ideas of the theorist, and gets into sympathetic touch with the masses, to whom he presents the ideas under suggestive or inciting forms. It is true that the immediate causes of social change are, as Mr. Spencer says, "the aggregate of men's instincts and sentiments," but we cannot assent to his further dictum that "these are not to be changed by a theory."

Distinctions in Love

One day last week a young couple boarded the west bound train at a little wayside station in Virginia. To a party of traveling men already in the coach where they found seats three things were evident: they were from the country, they were newly married and this was their wedding tour. The subdued radiance of the groom's sunburned countenance announced the fact; the terrified partridge air of the bride confirmed it. The drummers thought they saw the humor of the situation. Love was a bucolic comedy illustrated by this pair, and after the manner of their kind they made facetious comments, applicable all the way from the groom's celluloid collar to the startling millinery confection worn by the bride. But when the meadow pink on her cheek suddenly deepened to scarlet and the bow of her lips unstrung from the smile between, *he* stood up, a huge, toil-toughened statue of manhood, stared at the giggling crowd, while an exceedingly red Adam's apple worked convulsively under his chin. "She's my vi'let, I'm her oak; an' the fust man in this kyar as furgits what thet means air goin' ter feel er storm in his branches—understand?" They understood, especially the mixed metaphor.

That is to say, love is always a hallowed experience with which the vulgar must not meddle, even when it is illustrated by an unfashionable young couple from the country. It is the inspiration through which the homely young man

discovered the same beauty and charm in the woman by his side that a more esthetically exacting man would find in a Fifth Avenue belle. And for this reason it is the highest gospel teaching men and women ever receive of one another. They may fall from grace afterwards and forget that each is what the other thought him or her to be during the sacred courtship days. But that is not the fault of love's inspiration; it is the loss of it.

Meanwhile, the different reasons why men and women fall in love with one another are interesting and significant. A man of culture, endowed with that sense of proportion which comes from association with people of refinement and objects of beauty and elegance, is often attracted to a woman because she reminds him of a Gibson picture, or some fair saint's face he has seen in an Italian painting. Or, if he has the classical mind, she may seem to him a reversion to the goddess type, and charm his imagination because she calls to memory some stately epithet from the Iliad. In any case the woman he admires must coordinate with what he knows of art, poetry or religion. He instinctively tests her by these standards. She must incarnate beauty in form, suggest rhythm, and mean goodness to him—but merely by her appearance. He is not primarily a student of character or temperament, for in his circle of life these things are not in actual evidence. They are concealed by clothes, social conventions and the restraint people learn to exercise where self-reservation becomes the law of self-preservation. These are sophisticated lovers. They have studied love in poetry, art and life until even for them it will be an old experience. Besides, they have known all along what a courtship must consist in—meetings at luncheons and dinners, evenings at the opera, flowers, coaching parties, an up-to-date flirtation; finally, a careful inventory of charms and finances, and if the latter is satisfactory, the engagement follows. Cupid never worries with such lovers. They have outgrown his simple arts. Their courtship is cut and dried from the start, and there is not a phase of it which is not treated of in any book on etiquet, because in its last analysis it is a question of manners and money. Love is a pastoral simplicity, a primal tenderness which does not comport with the fashion of their lives.

But in the remote country place, from which the above mentioned couple came, love is still a refreshingly original experience. It is the daybreak of joy and hope for many who never knew before a thought beyond the dull routine of the day's work. Nothing has prepared them for the gladness, humility and egregious courage of such a sensation. For, there, a young man does not fall in love with a girl because she reminds him of a picture or a poem. He does not recognize her through his artistic faculties, because, ten to one, his faculties are not of that kind. Neither does she fit in with what he knows; for what he knows is so dull, so narrow and uninteresting, the surprise comes from the fact that she does not belong to any of the categories. But she suggests what he does not know, barely hopes—above all, she belongs to his scenery, to the rude interior of his home-longing heart. She is as symmetrically related to the woods and fields as the city bred man's Gibson girl is to an art gallery. The lark note in her voice is as sweet to him as the other woman's superb imitation of it is to the other man. The shy confession she makes of love by her very silence is more nearly correct than the brazen sword play of sensuous wit is in the society belle. In short, the bridal pair from the country doubtless had a really finer experience back of them than many of those who begin life with a European tour. To them love was a peculiar revelation, as sacred as if they were the only two people in the world chosen to receive it. And it has made such a profound impression upon them that they will grow old and remain faithful to one another on the strength of it.

But this is not always the case with the couple who began by being esthetically attracted to one another. A new Gibson girl often endangers the faded one's happiness; for it is astonishing how long the artistic faculties of some men remain unmarried after marriage. And it is equally disconcerting to know how many beautiful matrons in this circle have "affinities" dearer than husbands. There will never come a time in the life of the bridal couple from the country when they will not reckon "such doings" indecent. Their vision is clear,

they know what love really is, and knowing, they have no confusion about honor and dishonor, however well dressed.

The Future of China

WHATEVER shall be the conclusion of the present war in the East, the integrity of the Chinese governmental "entity" is pretty certain not to be immediately disturbed. Should Japan win, Manchuria will be restored to China, and Japan will take no Chinese territory. Should the belligerent Powers break even, things will remain as they were, with Russia in possession of Manchuria, while Japan will be predominant in Korea. Should Russia gain an impressive victory over Japan, she will annex Manchuria and strengthen her hold in Mongolia, but the European Powers will not allow her to take Pekin.

What, then, will China do with her lengthened lease of existence? The man best informed and with the best good will to China is Sir Robert Hart, and in a late communication to the Chinese Government he has indicated what China ought at least to do.

It is clear that she should immediately prepare to defend herself from that further aggression that would not be long delayed, especially in case of Japanese defeat. She is threatened by rapacious Christian nations, and must take measures of self-defense. She must create an army and a navy.

Let it not be thought that China is an overtaxed country, however her people may be fleeced by their rulers. Japan has a population of 42,000,000, with an arable area of only 13,000,000 acres, and she pays annually to the state, exclusive of local taxes, the sum of $95,000,000 (140,000,000 taels). China has 420,000,000 population, and arable area of 400,000,000 acres, and she pays only $72,000,000, which includes local taxes. These are not Sir Robert Hart's figures, but those recently published in "Oriental Series," vol. x; but Sir Robert credits China with three times as many acres of arable land in the 18 provinces.

Sir Robert would depend mainly on a land tax for the funds to create the new army and navy. The present customs duties, land tax and salt tax now produce only $55,000,000, and half of this is pledged to the empire's foreign debt. Some other source of income is therefore needed. Sir Robert would impose a new tax of some forty cents an acre, which would bring in, on his computation of the arable land, an income of about $550,000,000, of which half would be collected, a sum sufficient for the purpose.

With this new income Sir Robert would favor the establishment of four corps of 50,000 men each, to be gradually increased within ten years to half a million men, including reserves. The estimated cost is only $34,000,000, which ought to be sufficient, as Japan's peace army costs only $20,000,000 annually. Sir Robert would have three squadrons of navy, each consisting of 20 ships and 60 torpedo craft, the cost of maintaining which he puts at $20,000,000, the cost of the Japanese navy being $15,500,000. Then there would be arsenals, military schools, etc., to be maintained, and a considerable sum would have to be expended for postal extension, telegraphs, railroads, salaries and the support of the court, also to come out of the new tax.

Sir Robert Hart's proposal does not seem impracticable, but its execution depends on the honesty of the local officials. This might be made the occasion of extortion, so that the amount sent in to the Treasury would be but a small part of that extorted, in which case popular discontent might rise to revolution. Yet something of this sort is absolutely necessary if China will take a lesson from Japan and maintain her self-respect and her position among the nations of the world. Nor would the awakening of China be a Yellow Peril to Europe and America; it is the White Peril which is imminent and against which China must arm herself.

Women in the Organ Loft

ALREADY we have a clear intimation how our Catholic churches are to evade the Papal order forbidding women in the choir. For a while they were very quiet on this matter, and talked only of the prohibition of modern figured music. First, *The Tablet*, the leading English Catholic paper, printed a long letter from a woman to the effect that it is impossible that the Pope could have meant to forbid women to sing in the body of the church or in

the gallery, where the choir and organ usually are, but only in chancel choirs, which are very few, and where, of course, only clerics have a place. The plea is ingenious, and further rests on the inherent right of women to take part in the worship. Says the writer:

"Women's claims—and we are so vast a majority in any church—to be allowed to take the place they were fashioned by nature to perform, ought to count for something in whatever decision is come to by our Bishops when official intimation comes. The fact is that our exclusion is besides unnatural and out of keeping with the spirit of the age, which the Church usually considers a real grievance to very many earnest devout souls, who for years have lent time and faithful service to the Church in this respect."

"The spirit of the age" is a noticeable consideration. But the device of making the Pope's rule apply only to singing in the chancel or "sanctuary," is being made use of in this country. We are informed by *The Pilot* that figured music, and so, we presume, women singers, took part in the consecration of Bishop Cusack in New York as late as April 25th, and at the consecration of Bishop Stang, at Fall River, a week later, altho in both cases only the Gregorian music by male voices was sung by the sanctuary choir of priests. But they interfered no more than they have for many years with the female voices in the organ loft.

And now Rome adopts the solution suggested by the Catholic woman, if we can trust the reliable Roman correspondent of the London *Tablet*. He has interviewed the most competent authorities in Rome, and they explain the whole thing nearly away, in the line suggested previously, that the rule will apply only to the clerical choirs in the chancel, while in the organ loft or elsewhere women may sing all they please. We are first told that the ideal is purely liturgical choirs of men and boys, to be realized where possible, in cathedrals and rich city churches. But it will often be impossible to dispense with the mixed choir, and in such cases they are not forbidden. Certain singing, we are told, belongs only to the liturgical choir, the Introit, Gradual, Offertory and Communion; but they may sing the Kyrie, Agnus Dei, Gloria and Credo, and any of the Psalms and hymns of vespers. And, indeed, all "these provisions are to be observed when it is possible to observe them," which is lax enough, or may be. So those women's sodalities that have been praying that the Pope might relax his rule many consider their prayers in a fair way to be answered.

Patronizing Home Industries

THE frugal householder is again receiving bulky catalogs laden with descriptions of manifold materials for summer enjoyment. A thousand pages, shining with vivid pictures and ablaze with bargains, naturally force upon the buyer a consideration of the offerings. The temptation of the mail order house is great; the presentation of household necessities ranging from prunes to brass beds is enticing; the prices seem wonderfully low for such splendid values as are described.

Little wonder that the frugal householder ponders well the offerings and often invests in a money order, waiting with impatience the coming of the goods. If, when received, the articles be what he wants, and if he have saved money by sending away rather than by buying at the home store, he is apt to felicitate himself on his shrewd business judgment and to consider the mail order house a benefactor to the far-off purchaser.

This view is not that of the proprietor of the home store. He sees in the bulky catalogs a menace to his own business, and in the order of the frugal householder not only a loss of trade, but a positive injury to the town. The heaped up shipments of merchandise that arrive by express and freight arouse decidedly antagonistic feelings in the breast of the merchant, and he wonders how many of his cutomers will take this method of supplying their wants. It is, of course, easily conceivable that out of the thousand pages of the catalog the householder might select all his supplies, and the home dealer would thus be driven from merchandising.

Thus there are two sides to the proposition, and the buyer should remember the considerations of the home merchant in sending his order to a department store many hundred miles distant. Probably

not one of the patrons of the modern method of shopping at long distance would wish to have all the local merchants cease business. It would be exceedingly inconvenient to depend on Uncle Sam's mails for every article needful in home consumption. Household economics would permit no such delay in the obtaining of fresh coffee for breakfast or of vegetables for dinner. The desertion of all the home merchants would transform the small towns into mere groups of office buildings surrounding the post-office and the railway station.

That thousands of people ignore these fine distinctions of mutual interest is manifest from the fact that in one city of the nation the mail order business reaches the enormous total of fifty million dollars yearly. The rich firms that depend on catalogs in attracting customers are increasing their facilities and the volume of their business is steadily growing. It is, indeed, one of the most notable features of modern business life, and the frugal householder is but one of a vast army all supplied from the same central depot.

The extension of railway building, the rural trolley systems and the rural mail delivery have all aided in the development of this form of business management. The country buyer remote from railroad and without access to anything more pretentious than the cross-roads store is brought in touch with the enormous stocks of millionaire merchants. In consequence we read of single firms handling 30,000 pieces of mail daily, each one an order for goods and each accompanied by cash.

It is unquestionably commendable in the householder to exercise frugality and the growth of the mail order emporiums adds materially to the advertising patronage of the big city dailies; thousands of employees are utilized in filling the multitude of orders that center in the busy offices of the large concerns. Furthermore, there is probably less expense in handling goods on such a large scale than in the ordinary course of small-firm dealing. But we have a mutuality of interest that should not be overlooked, especially in newer communities where the local merchant has a struggle at the best and where he deserves the support of his fellows so far as possible. It is for this reason that the people of the Western States oftenest urge upon each other the precept of "patronize home industries," meaning thereby the upbuilding of institutions near at hand. It is by this loyalty that the communities thrive.

In many ways the mail order house does good. It opens the eyes of the recipient of the catalog or glowing advertisement to the large assortment of goods provided by industrious artisans; it forms a basis for comparison and a measure of worth. Frequently it introduces into isolated homes features and enjoyments that are of untold value as educators. When they serve in this way, adding to the richness of life and going beyond the limit of the local store in supplying new desires, their value to a community is positive. It is only when the home dealer is robbed of rightful patronage on such articles as he can and should furnish to the people around him that the catalog leads the householder astray. Just where this limit is each community must determine for itself. It does not reach so far in the West as in the East—thus accounting for the development of the mail order business in the Western States.

Occasionally arises a prophet who sees a future in which all the business of the nation pertaining to the material welfare of the people shall be transacted at the business centers; when the mails and catalogs shall drive the local merchant to the wall, making of him merely an agent for the issuers of catalogs. This is preposterous. The business of the mail order houses will grow as does that of the nation, but the hold of the local merchant will not be broken. The frugality of the householder will never lead him to desert entirely the grocer on the corner or the favorite salesman in the dry goods "emporium" on Main Street. He, or she, needs them too often.

When Santo Domingo Was Willing

On the 6th of December, 1869, the American flag was raised at Samana Bay on the island of Santo Domingo, with the full expectation that it would never be lowered. With this in view it was expressly stipulated that the money paid for the first year's rental of the bay,

$150,000, should be deducted from the price paid for the whole island, in case of the ratification of the treaty of annexation. This price was to be $1,500,000, which was no more than the estimated value of the property, docks, navy yards, custom houses and other public buildings owned by the Dominican Government. Out of this sum all the debts of Santo Domingo were to be paid, so the United States would have a clear and unincumbered title to the eastern portion of the island. As a bargain in islands this was as cheap as dirt, and could not be matched to-day, notwithstanding the present low prices of West Indian real estate.

We are told at the present time that the Dominican people are opposed to any closer connection with the United States. This also was the argument a generation ago, and even when a definite agreement for annexation from President Baez was presented it was held that he had no authority to "sign away the liberties of his people," as he was not legally elected. Since there are usually two or more presidents in Santo Domingo and it is often difficult to distinguish between two such prominent citizens as Señor De Jure and Señor De Facto, the argument had some force until it became known that the opposition to annexation so vehemently expressed by Cabral, the revolutionary leader, who was waging a guerrilla warfare from the Haitian frontier, was due more to his position than to his principles, and that when he had been in power in 1866 he had done just what he condemned Baez for doing, and had offered a perpetual lease of the Bay of Samana to the United States. Cabral, indeed, proved to be a boomerang in the hands of anti-annexationists in the United States. The eloquence of Sumner depicted him to the Senate as a second Lincoln seeking to unite the seceded provinces of Santo Domingo with the republic of Haiti, but this interpretation of his policy was indignantly repudiated by Cabral himself in a public letter.

There was then nothing left for the opponents of the measure but to claim that the people of Santo Domingo did not want it. But, unfortunately for this argument, the treaty provided for a free vote of the people on the question before it had any validity, and the vote taken in February, 1870, was almost unanimously in favor of it. There were 15,169 votes for annexation and less than 400—that is, about 2 per cent. of the total vote—against it.

In the United States Congress the policy of annexation had a clear majority in both houses, but the treaty failed of the necessary two-thirds vote in the Senate through the energetic opposition of one man, Charles Sumner, of Massachusetts, who was chairman of the Committee of Foreign Relations. Sumner's attitude in the matter has never been satisfactorily explained. President Grant went to his residence to consult him on the subject, and submitted to him the first draft of the Dominican treaty. The President, General Babcock and Colonel Forney all considered him to have pledged his support to it. But then, as now, the question of patronage interfered with Senatorial interest in treaties, and by the time the treaty came to be voted upon he was much incensed at Grant for refusing to follow his recommendations as to appointments and removals.

The opposition to the treaty took the form of a bitter attack on the character and methods of General Babcock, the confidential agent of the President, who negotiated the treaty. But Grant was not a man to shirk responsibility for acts done by his authority, and he notified the Senate that General Babcock had only followed his instructions and that he entirely approved of his conduct. The Select Committee of the Senate appointed to consider the charges of Sumner and others that the treaty had been obtained by corruption, misrepresentation and threats reported

"that in its negotiation and preparation the treaty is free from any fraud and unfairness, and that the agents employed by the respective Governments have all acted with becoming frankness and sincerity."

The Democrats and their Republican allies not only refused to believe the evidence presented to prove that the Dominicans favored annexation, but opposed the proposal of Grant that a commission should be sent to the island to make a thorough examination of conditions there. A resolution authorizing such a commission was, however, passed

by both houses, and Benjamin F. Wade, Andrew D. White and S. G. Howe were appointed to serve on it. Frederick Douglas, General Sigel and a number of scientists also accompanied the expedition to report on special topics. The commission divided into small parties and passed through all parts of the island, conversing with high and low, natives and foreigners, officials and insurgents, and came to the unanimous conclusion that almost all of the Dominicans favored annexation, as a territory of the United States, and that such a measure would be of great benefit to both countries. This report was transmitted to Congress with a strong message by the President, but no action was taken.

If we cannot trust either official representatives, a popular vote, or an informal canvass, it is hard to see how the sentiment of the people can be ascertained. President Baez may have been a tyrant and a usurper, but has any other President in Santo Domingo, before or since, a less disputed claim to his seat? The vote on annexation undoubtedly was not as fair an expression of enlightened public opinion as a popular vote with us, but neither are the other elections on the island. Certainly the people of the United States never had even as much of an opportunity of saying whether on the question of annexation they stood with Grant or with Sumner.

Russia and Germany

We could hardly believe it when first reported, but the statement is repeated and believed, that a secret treaty has been made between Russia and Germany by which Germany agrees to guarantee to Russia, by war if necesssary, that no initiative of England or the United States shall bring about an international congress to settle the Far Eastern question. That is, it was agreed that Russia should be allowed a free hand in the expected event of her victory over Japan, and that no concert of the Powers should prevent her from gaining all the fruits of it she wants when war ends with a treaty dictated in Tokyo, Germany also being allowed her share in the spoils. The object is to prevent Russia being treated as Japan was after her war with China. But the continued success of Japan seems to put a little different complexion on things. If Japan is successful, as now seems likely, it is not easy to see how Germany could give much help to Russia, either in diplomacy or war. Russia would have to retire from Manchuria, which would necessarily revert to China, and Korea would remain under Japanese administration and rehabilitation, and Germany would not enlarge her holdings in Shantung.

Senator Quay knew and cared very little about statesmanship, but very much about politics. He believed in the boss system, and was himself the ablest and most successful practitioner of its arts. While we wish the race and its methods extinct, we are glad to be able to find something good to say of Senator Quay. He was personally a likable man, and he was a brave soldier. While the army of the Potomac was lying before Fredericksburg the army surgeon pronounced him unfit for duty, and he sent in his resignation. But when the battle was coming on he volunteered, took active part in the assault on Lee's lines, and received a medal for bravery. The surgeon who examined him said he was a fool to go into the battle, but he replied, "I had rather die a fool than live a coward."

When an American missionary woman was captured by Macedonian bandits her friends had to pay the ransom. The ransom, no matter how large, demanded by the Moroccan bandit Raisuli for the return of Messrs. Perdicaris and Varley, one American and the other English, would doubtless be paid by Morocco; but when Raisuli demands that Great Britain and the United States guarantee that he and his band receive amnesty for all their offenses, and that the Moroccan troops be withdrawn and all taxes released, leaving them independent, of course neither Great Britain nor the United States can make any such agreement. The two men may be killed, but if so there will be a bitter reckoning, and after it, under the new treaty, France will have a pretty free hand in Morocco, which is much to be desired.

Financial

Canada's Railway Project

At the close of an all-night sitting, in the Canadian House of Commons, on the morning of the 27th ult., the Government's bill for the new National Transcontinental (or Grand Trunk Pacific) Railway was passed by a vote of 105 to 59. The construction of the road is now assured. It is interesting to observe that the test vote was cast upon an Opposition amendment providing for Government ownership of the whole line. This proposition was based, however, upon an assertion that the obligations assumed by the Government in the bill would provide for almost the entire cost of construction. Therefore, the leader of the Opposition argued, public interests would be more satisfactorily served if the road should be constructed by the Dominion and owned by the people. If Government ownership of the unprofitable Eastern division (which extends from the Atlantic Coast to Winnipeg, and is to be Government property) was to be desired, he said, it would be wise to provide for Government ownership of the profitable Western division. There is scarcely any difference of opinion as to the successful and profitable operation of that part of the projected road which will extend from Winnipeg to the Pacific, through the new wheat district; but it seems probable that very little local traffic will be developed along a large part of the remainder of the line, between Winnipeg and the Atlantic.

Trade With the Islands

In an elaborate report, issued by the Government last week, concerning trade with our insular possessions for the nine months ending with March, two points especially deserve attention —the decrease of trade each way, in the case of Porto Rico, and the fact that imports into the Philippines from other countries are seven times the imports from the States. The decrease of trade with Porto Rico is disappointing. There was a loss of 8½ per cent. in imports from the States, and of 6 per cent. in exports to the States. On the other hand, trade in each direction with Hawaii and the Philippines showed a considerable increase. Porto Rico needs capital and immigrants from the States. In the corresponding nine months of 1903 the Philippines received from the States only $2,903,692 worth of goods and $21,168,801 worth from other countries. The islands sold to us $9,235,372 worth, while their sales to other countries were $13,497,039. In the present year there has been a slight change for the better, because our trade both ways shows an increase of 11 per cent.; but the figures for the foreign trade, if they were available, would exhibit an excess almost as large as last year's. This excess is due partly to the restraint unwisely imposed by the exaction of 75 per cent. of the Dingley tariff duties on all imports from the islands.

The plan for reorganizing the United States Realty & Construction Company, proposed by a committee composed of James Stillman, P. A. Valentine, Otto T. Bannard, Stephen S. Palmer and James H. Post, provides for a new corporation, with an authorized capital of $30,000,000, which shall issue $13,506,000 in bonds. The new stock and bonds are to be offered in exchange for the old preferred and common shares, upon terms which are stated in our advertising pages.

....An association of the trust companies of the State of New York has been formed by the action of the officers of fifty companies, representing about $750,000,000 in assets. The president is George W. Young, president of the United States Mortgage & Trust Company. The vice-presidents are Otto T. Bannard, president of the New York Security & Trust Company: Theodore F. Miller, president of the Brooklyn Trust Company, and Grange Sard, president of the Union Trust Company of Albany. Among the members of the executive committee are Levi P. Morton, president of the Morton Trust Company; F. P. Olcott, president of the Central Trust Com-

Insurance

New England Summer Hotels and Fire Insurance

A TABULATED list of New England summer hotel fire losses has just been compiled by H. L. Hiscock, special agent of the Ætna. It contains much valuable information and shows the amount of property loss, the sums paid by the various interested companies because of insurance and the causes of summer hotel fires in New England during the past six years.

During the period covered by the report there were seventy-eight hotels burned and thirty-one partial losses. The total property loss is estimated at $1,116,849, while the loss to insurance companies was $747,495. Figures on three hotels that were not obtainable because of litigation will doubtless ultimately somewhat increase the aggregate insurance loss.

The defective chimney figures as an extra hazardous risk in the table. The following is a list of the causes of the New England summer hotel fires, together with the amounts paid and percentages:

			Per cent.
Carelessness of workmen...	1	$36,500	5
Defective chimney.....	22	173,165	23
Electricity (defects in equipment)	3	82,160	11
Explosion of lantern.....	1	11,200	2
Exposure	8	39,333	5
Fireworks	1	4,000	½ of 1
Forest and wood fires.....	2	2,000	½ of 1
Furnaces and stoves.....	4	18,970	3
Incendiary	20	93,620	12
Plumbers and tinners.....	2	137,000	18
Unknown	14	120,234	16
Partial losses of various causes	31	29,313	4
	109	$747,495	100

The losses by States for the six years is shown in the following table:

	Number.	Loss.	Insurance paid.
Maine	28	$300,460	$191,699
New Hampshire....	15	214,920	163,827
Vermont	1	13,660	8,660
Massachusetts	28	267,347	176,913
Rhode Island.....	5	278,198	171,083
Connecticut	1	12,000	6,000
	78	$1,086,585	$718,182
Partial losses.....	31	30,264	29,314
	109	$1,116,849	$747,496

The Late Charles Henry Booth, the World's Oldest Policyholder

CHARLES HENRY BOOTH, who died at Englewood, N. J., on Sunday last, in his one hundred and first year, was the world's oldest policyholder. Mr. Booth was born in Stratford, Conn., on September 13th, 1803. Last year, when he attained the age of 100, the Mutual Life Insurance Company, of which Richard A. McCurdy is President, prepared a handsome testimonial in honor of the event. Mr. Booth has until very recently been very active, and much of his time was spent out of doors working about his house. Prior to his last illness he had never had any serious sickness since early manhood. He did not use tobacco or stimulants, to which fact he attributed his extraordinary vigor, which permitted him to shave himself daily, even after he attained the age of 100.

pany; John E. Borne, president of the Colonial Trust Company; Henry C. Deming, president of the Mercantile Trust Company; George H. Southard, president of the Franklin Trust Company, and Julian D. Fairchild, president of the Kings County Trust Company. The first regular meeting will be held in September.

The Independent

Vol. LVI NEW YORK, THURSDAY, JUNE 9, 1904 No. 2897

Survey of the World

Candidates for the Democratic Nomination

For three days last week Senator Gorman, ex-Senator Smith, of New Jersey, and Colonel Guffey, leader of the Pennsylvania delegation, were in conference at New York, consulting with the Tammany leader and also with prominent supporters of Judge Parker. The assertions and comments of newspapers that favor Parker's candidacy indicate that this conference was not in his interest, but was really hostile to him. Friends of Mayor McClellan were much encouraged by what was said and done. It was asserted by some of them that Pennsylvania's large uninstructed delegation might be brought to his support. Colonel Guffey said to the press that neither he nor the Pennsylvania delegation had made a combination in favor of any candidate. It was noticeable that no one of the prominent visitors would commit himself to the support of Judge Parker. Their intention is said to be to prevent instructions in conventions not yet held, in order that the main question may be left open. Judge Parker's friends won a substantial victory in Georgia, where instructions for him were given, at first by a narrow majority, and then by unanimous vote. Mr. Hearst's name was not mentioned, and every Hearst candidate for the delegation was defeated, even Congressman Griggs, formerly chairman of the Congressional Committee. The old national platforms were not reaffirmed. At the end of the week Judge Parker had a little more than 200 instructed delegates, and a newspaper canvass showed 50 more for him among the uninstructed. It was clear that the national convention would be controlled by the conservative element. A majority of the delegates stand upon platforms that ignore the currency utterances of the national platforms of 1896 and 1900. It is estimated that the Bryan-Hearst element will not control more than 200 votes, and surely cannot control one-third of the convention. Mr. Hearst has sharply reduced the current expenses of his canvass, the cost of which up to date is said to have exceeded $1,000,000. His agent in Chicago, writing to a political employee in Missouri last week, said: "Mr. Hearst now feels that the delegates should be permitted to vote for the man whom they regard as the best candidate." It is announced that Mr. Hearst's mother has withdrawn from the University of California her annual subscriptions for several undertakings that have relied upon her benefactions, including the Domestic Industries, a College Settlement and the Young Women's Christian Association. Her friends say, so it is reported by the press, that she feels hurt on account of the treatment of her son in the State convention, and that she had been led to believe that the convention would support his candidacy by unanimous vote. She has also withdrawn irrevocably her annual subscription of $16,000 for the support of the Phoebe A. Hearst College for Kindergartners, in Washington, D. C. —Charles A. Walsh, secretary of the Democratic National Committee, remarks that Mr. Cleveland's recent statement "makes absolutely impos-

sible the nomination of Judge Parker." Mr. Bryan says that Judge Parker's silence is designed to deceive the public. His views must be known, Mr. Bryan adds, to those who are supporting him, whose purpose is to "place the party once more under the control of the Wall Street element."—Prominent Republicans in Missouri will ask the Republican convention in that State to indorse the Democratic nomination of Mr. Folk for Governor. It is expected that those nominated with him for subordinate offices will be representatives of the "ring," and therefore it is thought by some that a good Republican ticket with Mr. Folk at the head of it might be successful. Friends of Judge Parker have been talking with Mr. Folk about the Vice-Presidential nomination, which he declines to consider.—It is understood that objection to the choice of Secretary Cortelyou for chairman of the Republican National Committee has been made by certain Congressional leaders, who argue that he lacks experience and might not be able to raise the money required. On the other hand, it is said that the President, espcially desiring that the campaign shall be a clean one, thinks that a large sum of money will not be needed.—Leaders of the Prohibition party say that General Miles would be nominated at their convention if he were known to be identified with the organization; as he has not associated himself with it by any public statement, they must look elsewhere.

The State Conventions

In Illinois a long contest over the Republican nomination for Governor was ended last week on the seventy-ninth ballot by the nomination of Charles S. Deneen, of Chicago, who had 957 votes, against 522 for Frank O. Lowden. Governor Yates withdrew, his friends having made a combination with those of Mr. Deneen and the minor candidates. It is said that the agreement looks to his election to the Senate as the successor of Mr. Cullom. Mr. Lowden was the choice of the leader and the organization in Chicago, but Mr. Deneen had the support of the prominent Republican papers in the city. It was asserted by them that the influence of all Federal officers and of the two Senators was exerted for Lowden. The successful candidate is a lawyer, the son of a Professor in McKendree College, and has been prosecuting attorney in Chicago since 1896. We have already spoken of the Democratic convention in Georgia. The Michigan Democrats chose 24 delegates, 8 of whom were for Hearst, but he loses them under the unit rule. A majority are said to be against Parker. Wyoming gave Hearst her six delegates. In Oklahoma the convention was thoroughly in sympathy with Mr. Bryan, and the delegates were instructed to act with those who supported the tickets and platforms of 1896 and 1900. Alaska's six delegates were instructed for Parker. Nebraska's Democratic convention was completely under the control of Mr. Bryan. Only 17 of the 1,064 delegates opposed him. He will lead the delegates-at-large. A long platform, written by him, reaffirms the national platform of 1900, and is in accord with his recent speeches with respect to plutocracy, militarism, imperialism, monopolies and the tariff. It calls for an income tax, direct election of Senators, an eight-hour law and relief from government by injunction. Concerning the currency, it opposes the recoinage of the silver dollars into smaller coins, the use of assets as security for national bank notes, and "the loaning of Government money to favored banks." It is stated that all the sixteen delegates oppose the candidacy of Hearst.

Justice Brewer on Corporations

Addressing the graduating class of the Albany Law School, last week, on "The Ethical Obligations of the Lawyer as a Lawmaker," Justice Brewer, of the Supreme Court, in the course of his remarks spoke as follows of the sources of the temptation to which such a legislator is subjected:

"I call your attention to the sources of a lawmaking lawyer's temptation, the greatest of which comes from the marvelous development of corporate interests. These interests are colossal in size, alluring by the magnitude of their achievements, tempting not merely by the money they possess and with which they can reward, but more by the influence they can exert in favor of the individual lawmaker in the furtherance of his personal advance-

ment. No one can be blind to the fact that these mighty corporations are holding out most tempting inducements to lawmakers to regard in their lawmaking those interests rather than the welfare of the nation.

"Senators and Representatives have owed their places to corporate influence, and that influence has been exerted under an expectation, if not an understanding, that as lawmakers the corporate interests shall be subserved. I am not here to deny the value of corporations. I realize the magnitude of the work that is possible through such combinations, and I do not deny their right to be heard before any legislative body in defense of their rights or in furtherance of their interests.

"But the danger lies in the fact that they are so powerful and that the pressure of so much power upon the individual lawmaker tempts him to forget the nation and remember the corporation. And the danger is greater because it is insidious. There may be no written agreement. There may be, in fact, no agreement at all, and yet when the lawmaker understands that that power exists which may make for his advancement or otherwise, that it will be exerted according to the pliancy with which he yields to its solicitations, it lifts the corporation into a position of constant danger and menace to republican institutions."

The conditions of life in this country, he continued, had wonderfully changed. Formerly there had been two parties, the individual and the Government; now there were three, the individual, the corporation, and the Government. The corporation, in some aspects standing half way between the individual and the Government, at times antagonized both the interests of the one and the powers of the other. But it was here, and here to stay, a powerful factor in promoting both the material and the intellectual advancement of the Republic.

On the Isthmus

The question whether the duties of our tariff law are to be imposed upon all the machinery brought into the canal zone, and all the food supplies imported into it for the laborers employed, has been thoroughly considered by the Commission and the Treasury Department, whose opinions have been submitted to the President. It is reported that the Commission, desiring to make the cost of construction as low as possible, asks that the machinery and supplies shall be subject to no tariff tax whatever, and that Secretary Shaw holds to the opinion that all the Dingley duties should be imposed, arguing that foreign manufacturers of machinery, in the absence of a tariff, might be able to undersell our own manufacturers. The decision of the question rests with the President, unless Congress decides it by new legislation.—Nicaragua, having lost the canal, turns to railroads, and will construct a line from Monkey Point, on the east coast, not far north of Greytown, to Lake Nicaragua. Carriage by water across the lake to Granada will connect this railway with the one now in use from Granada, by way of Managua, to Corinto, on the west coast. The Government has appropriated $3,000,000, and expects to have the route across the isthmus in operation within a year and a half. Surveys have been made for another railway, across the northern part of the republic.

No Jury Trials in the Philippines

Three interesting cases involving the rights of the inhabitants of the Philippines were decided by the Supreme Court last week, the division being 5 to 4, as in the earlier cases concerning the relation of the Constitution to the islands. Dorr and O'Brien, editors of a newspaper in Manila, were prosecuted for criminal libel, and convicted. Their demand for a trial by jury having been overruled, on this question they appealed to the Supreme Court. The court (opinion by Justice Day), pointing out that the right to trial by jury had not been granted by law of Congress, held that this right was not given to the islands by the Constitution without Congressional enactment:

"The power to govern territory implied in the right to acquire it and given to Congress in the Constitution, does not require that body to enact for ceded territory not made a part of the United States by Congressional action a system of laws which shall include the right to trial by jury. The Constitution does not, without legislation and of its own force, carry such right to territory so situated."

Chief Justice Fuller and Justices Brewer, Peckham and Holmes concurred. Justice Harlan vigorously dissented. He said:

"As for the commission of the crime of murder, a Filipino, subject to the sovereign power of the United States, may be hanged by the authority of the United States. The suggestion that he may not, of right, appeal for his protection to the jury provisions of the Constitution is utterly revolting to my mind and can never receive my sanction. The Constitution declares expressly that 'the trial of all crimes, except in cases of impeachment, shall be by jury.' It is now adjudged that that provision is not fundamental in respect of ten millions of human beings over whom the United States may exercise full jurisdiction. Indeed, it is adjudged, in effect, that the above clause, in its application to this case, is to be construed as if it read: 'The trial of all crimes, except in cases of impeachment, *and except where Filipinos are concerned*, shall be by jury.' Such a mode of Constitution interpretation plays havoc with the old fashioned ideas of the fathers."

The judgment of the court he regarded as "an amendment to the Constitution by judicial action." Two other cases involved the validity of the Philippine law permitting an appeal by the Government from an acquittal of a prisoner by a court of first instance. In one of these a lawyer named Kepner, charged with embezzlement, was acquitted by the court of first instance. The Government appealed, and in the higher court he was convicted and sentenced to be imprisoned. He claimed that in violation of the Constitution he had been twice placed in jeopardy. The majority opinion (by Justice Day) upholds this claim on the ground that the part of the Constitution in question was extended over the islands by Congressional legislation, altho the right to trial by jury was not. The release of Kepner was ordered. Justices Holmes, Brown, White and McKenna dissented.—According to the census of the Philippines, just completed, the population of the islands is 7,635,426 persons, of whom 647,740 are classified as wild and uncivilized. A majority of the latter are in Mindanao and Jolo, but 223,506 are in Luzon, the most populous (3,798,507) of all the islands. Panay (743,646) is second in population. Only 14,933 of its people are classified as wild, and all of Cebu's 592,247 inhabitants are civilized.—Ricarte, the insurgent leader who instigated the revolt of a part of the constabulary garrison at Vigan, has been captured in Luzon and exiled again to Guam.

Workmen and Employers

The strike of the freight-handlers on the New York piers of the New England steamship lines appears to be a failure. These lines are owned by the company operating the railroad lines between New York and Boston, which is moving the usual number of freight cars, altho freight business at its stations, as well as on the piers, has been affected by the controversy. The President of the union (Lawrence Curran, of Chicago), admits that a blunder was made in ordering this strike. Last week some help was expected from a projected strike of the firemen of all the Southern coastwise steamship lines having terminals at New York. The firemen's union will demand an increase of wages and the abolition of the crimping system.—No wage reductions are reported, but the railroad companies and some industries are reducing the number of their employees. In Fall River, the cotton manufacturers have decided to postpone indefinitely a suggested reduction of wages. The Pennsylvania Railroad has laid off 1,100 men on its Panhandle division, for lack of freight. Output at the iron furnaces is again to be restricted, and it is said that the bar iron mills will be closed for some weeks, beginning on July 1st. Workers in the tin plate mills submitted some time ago to a temporary reduction of 18 per cent. The union (Amalgamated Association) has provided for a reduction of only 10 per cent. in the scale which the manufacturers will soon be asked to adopt for the coming year. They do not intend, it is said, to pay more than the present rates. In Wisconsin the paper mills are idle, and will probably remain so during the summer. The 7,000 workmen involved protested against the resumption of a long-hour schedule that had been superseded. On the other hand, the manufacturers say that they have learned, from two years' dealings with the unions, that the latter do not keep their agreements.—It is feared that the general strike at the works of the Dominion Iron and Steel Company in Sydney, C. B., will spread to the Dominion Coal Company. Wages

were reduced by 15 per cent. in December. The men recently asked that the old rate be restored, asserting that the company had promised to restore it in the spring. The company offered arbitration, which was rejected.—In Boston, several workmen have recently recovered damages, amounting to about $1,000 for each of them, from brewers by whom they were employed at the time of the strike in 1902. Being members of the union, they were induced by their employers to remain at work under an agreement that they should have permanent employment and be defended against the union's hostile action. At the end of the strike, however, they were promptly dismissed at the union's demand.—Governor Herrick has sent four companies of militia to Hanging Rock, O., owing to much disorder at the furnaces in that place, where workmen on strike have attacked negroes imported from Virginia to take their places. One man was killed last week, and a furnace superintendent was wounded. At Eveleth, Minn., a mob of striking miners attacked non-union men. Two of the strikers were mortally wounded by officers, who repelled them. —C. W. Post, a well-known manufacturer of breakfast food and of a substitute for coffee, at Battle Creek, Mich., has sued for damages, through the agency of the Anti-Boycott Association, a paper in Kentucky that published an appeal from the local typographical union for a boycott of his goods, on the ground that he was the financial supporter of a paper in Los Angeles which is said to be the foe of organized labor, and also because he was a member of the Manufacturers' Association. Mr. Post gives notice that he will sue any other publisher who attempts to boycott his company. "I do not purpose," he says, "to permit labor unions to manage my business. They have tried it and failed."—The Supreme Court of Missouri has decided that the law empowering courts to punish witnesses for refusal to testify before the State Board of Arbitration is unconstitutional.—Twelve non-union miners in Colorado were murdered by means of dynamite, a little after midnight on the morning of the 6th, at the Independence railway station, near Cripple Creek. Having finished work, fifty men were standing on the station platform waiting for an approaching train. Under the platform a quantity of dynamite was exploded by a revolver connected by wire with a point 300 feet away. The bodies of twelve miners were blown to pieces; eight of their associates were fatally injured.

San Domingo The Dominican revolution and the counter revolution against the revolution and the revolution against the counter revolution, etc., all seem to have come to an end last week when Commander Dillingham, of the United States cruiser "Detroit," through his good offices brought together the warring factions, and got them to cease fighting one another and to lay down their arms. The terms for the settlement of the dispute have been agreed upon. The Government guarantees to every revolutionist life and liberty, and will pay their debts. The insurgents in return will lay down their arms and recognize the Morales Government. The Governor of Puerto Plata and the American Vice-Consul acted as the peace commission in bringing this situation about. They sailed on the American gunboat "Newport" to Monte Christi, and invited General Rodriguez, chief of the revolutionists, to hold a conference with them on the "Detroit," who accepted their invitation. Whether this is a permanent peace or not remains to be seen; but all reports unite in saying that for the present, at least, "chronic deviltry" will be quiescent in turbulent San Domingo.

Compulsory Service in England The inefficiency of the British military service exposed by the Boer War caused many rumors of conscription, but the measure was not regarded as serious politics until now, when the Royal Commission on the reorganization of the militia and volunteer forces have made a positive recommendation in favor of it. The Commission proposed that a force for home defense be raised by conscription, numbering about 350,000 men, who shall serve for one year in the ranks and a few weeks annually at the maneuvers for two or three years afterward. It is claimed that

this will cost less than the present system of militia and volunteers, who are very poorly trained and not adapted for serious work under modern conditions. A system of conscription, altho it would demand only a small proportion of the able bodied men of the country, chosen by lot, would require the enrollment of all the young men and interfere with their emigration and personal freedom to a great extent. It is said, however, that both the Unionist and Liberal leaders regard such a measure as inevitable in the near future, since all other nations except the United States have been forced to adopt it. No new legislation is needed, since the King, on the advice of the Privy Council, has now the right to call upon each county of the United Kingdom and Ireland for a certain quota of men between the ages of eighteen and thirty for military service at home and at Malta and Gibraltar, tho nowhere else. This law is formally suspended by an act of Parliament passed in the closing days of each session, but, if this suspension act were omitted, conscription could be at once adopted.

Austro-Hungarian Affairs

The suppression of the strike on the state railroads of Hungary through the energetic action of Count Tisza was followed by a number of sympathetic strikes and minor riots, but these were unconcerted and futile. The strike committee at Budapest were arrested, and will be tried on the ground that they are state officials and have disregarded their duties. The penalty for a public officer who violates his oath of service is three years' imprisonment. The opposition deputies had prepared to attack the action of the Premier in the Chamber, but he checkmated this movement by reading a royal decree closing the session. The Austrian Chamber was also adjourned at the same time; Dr. von Körber having failed to enforce parliamentary order and transact any business of importance. During the preceding fortnight thirteen sittings were held, at which over 400 interpellations were read, mostly verbatim. Fifty-three votes were taken by roll call and three urgency motions discussed, one of which had been for 18 months on the table of the House. One hundred and forty-nine urgency motions are still on the calendar. The failure of parliamentary methods seems to be complete.—A great sensation was caused by the announcement before the delegations of the Austrian and Hungarian Parliaments, convened at Budapest to consider the estimates for 1905, that an extraordinary appropriation of $18,330,000 for the army and $15,562,500 for the navy were asked for. Altogether, it is planned to spend during the next few years the enormous sum of $73,750,000 for military purposes. There has been much speculation as to the reason for this great increase in expenditure in preparations for war, but no explanation is offered by the Government. The estimates are partially itemized, but there are many millions for unspecified purposes.

The British in Tibet

According to statements made by the Government in the House of Lords, the "peaceful mission" has become transformed into a military expedition, and the British Empire is at war with Tibet. The fiction of Chinese suzerainty over Tibet has been dropped since the Amban, the Chinese representative at Lhasa, is not allowed by the Dalai Lama to go to Gyantse to meet the Mission, altho, according to English opinion, he is authorized or ordered to do so by the Pekin Government. The expedition is not now in a very promising position. It cannot retire without great loss of prestige. As long as it remains at Gyantse it is at a heavy and useless expenditure and in constant danger of being cut off from its source of supplies in India and of being overwhelmed by hordes of fanatics. If it proceeds to Lhasa, which is the least objectionable of the three alternatives, there is no reason to think that the Dalai Lama or any other authoritative person will be found there to negotiate with, and a British delegation could not be left there unless supported by a strong force sufficient to protect it and keep open communications with India. The Tibetans have refused to forward to Lhasa the letter written by Colonel Younghusband, notifying the Government of his intention to advance on the

capital unless the Amban and Tibetan delegates meet him at Gyantse by a certain date. A half-battalion of native infantry drawn from the Fortieth Pathans have been selected for service in Tibet, and other reinforcements will follow them. The Tibetans at Gyantse have almost daily bombarded the British post there, but practically without effect, and they have not succeeded in interrupting communications with India for more than a few days at a time, altho this would not be difficult considering the smallness of the force and length and difficulties of the route. Three small cannon were brought from Lhasa by the Tibetans and mounted on the wall of their fortifications with much shouting, blowing of trumpets, and beating of drums, and, as soon as the first shot was fired, numbers of the enemy jumped upon the walls, uttering wild cries of defiance in order to frighten the enemy. A Maxim was turned on them and they quickly disappeared. The cannon threw balls weighing 3½ pounds, but the fire was ineffective, and a sortie by the British captured the guns. The military inefficiency and cowardice of the Tibetans is well illustrated by the capture of Karo Pass, which is 16,000 feet above the sea level and flanked by high precipices. Here 1,600 of the natives had erected strong walls and prepared rocks to be hurled down from both sides of the gorge. Colonel Brander, with 300 men, about two-thirds of the Gyantse garrison, was ordered to clear the pass. He reached the place, 43 miles distant, on the third day, made a direct attack with the Pioneers, while a company of Gurkhas climbed a precipice 1,200 feet high and outflanked them. As soon as that movement was accomplished the Tibetans fled. Their loss was over a hundred, while there were five killed on the British side.

The Russo-Japanese War

Another week of conflicting rumors and stringently censored dispatches from which no general movements can be clearly discerned. The Japanese have been landing more troops on the Liao-Tung Peninsula and at Takushan and approaching Port Arthur, and there is no proof that General Kuropatkin intends to come to the aid of the beleaguered city from the north. There have been almost daily engagements between the Japanese outposts north and west of Feng-Wang-Cheng and the troops of Cassocks sent out from Liao-Yang and Mukden. One of these occurred on June 1st at a pass about twenty miles north of Samaja, and therefore about 115 miles north of Feng-Wang-Cheng, where the Japanese had entrenched on a hill and were attacked by five companies of General Rennenkamp's Transbaikalian Cossacks, who lost six killed and 22 wounded. Both sides claim the victory, but, on the whole, the Russians are continually falling back, as a few days before they were reported as having engaged the Japanese near Kwan-Tien, about 60 miles northeast of Feng-Wang-Cheng, and Samaja is now held by a strong Japanese garrison. On the Liao-Tung Peninsula there has been some fighting on the railroad about nine miles north of Polan-Tien, between the Japanese under General Akkiama and the Eighth Siberian cavalry, under General Samsonoff. The Russians claim to have annihilated a Japanese squadron of 200 men by a furious charge of the Cossacks with lances. From Tokyo, on the contrary, comes a report of a Japanese victory at the same place and time, in which the Russian troops were driven northward and the Japanese loss was only 26. Dalny is now being used by the Japanese as a landing place for troops and they are estimated by the Russians to have now about 80,000 men on the Liao-Tung Peninsula. Port Arthur is supposed to contain 20,000 to 30,000 soldiers, and there are already rumors of dearth of provisions and supplies. The Japanese have fortified the hights of Kwan-Tung a few miles from Port Arthur, and are placing siege guns in position.

Morocco

One of the first results of the dominant position in Morocco now acquired by the French will be thorough exploration of this comparatively unknown country, where there are large areas never visited by a European explorer. This work will at once be taken up energetically under the superintendence of M. Etienne, president of the Morocco Committee and representative of the province of Oran, Algeria, in the French Chamber of Deputies, of which

he is one of the vice-presidents. M. de Segonzac will complete the exploration of the Atlas range, which has hitherto been crossed at only two or three points. The first number of the organ of the association, *Archives marocaines*, will soon be published. Along the Algerian frontier the predatory Moroccan tribes have been kept in order very successfully by means of mounted troops of native warriors under French officers stationed at a few well-chosen outposts. The railroad from the coast near Oran will reach Ben-Zireg by the end of the year, and later will be extended to Bechar and Kenadso. It was originally planned to run the railroad south into the desert to the oasis of Touat in the direction of Timbuktu and Lake Tchad, but this project is now temporarily abandoned in favor of the more tempting territory of Morocco now opened, so an effort will be made to push westward toward the Atlantic through Southern Morocco, where there are said to be good prospects for zinc, copper and lead mines and perhaps oil and coal fields. This southern route is expected to reach ultimately Marakesh and Magador. Northern Morocco will be penetrated by the extension of the Algerian railroad, now terminating at Tlemcen to Fez, Mekinez and Rabat and Mazagan, thus connecting the Mediterranean and Atlantic. The map on page 1320 will assist the reader in understanding these projects. On this we have marked off that portion of Morocco which England stipulates shall never be fortified by France, lest it should endanger the British control of the Strait of Gibraltar. The author of the article, the correspondent of the London *Times* in Morocco, was captured last summer by the same bandits who now have Perdicaris, and was released in exchange for 16 native prisoners held by the authorities. Mr. Harris has written to Raisuli offering to take the place of Mr. Perdicaris, but the offer was refused on the ground that negotiations had already begun. Mr. Perdicaris wrote him on May 25th that he and Mr. Varley were confined to one room and only allowed to go out in the evening: He says:

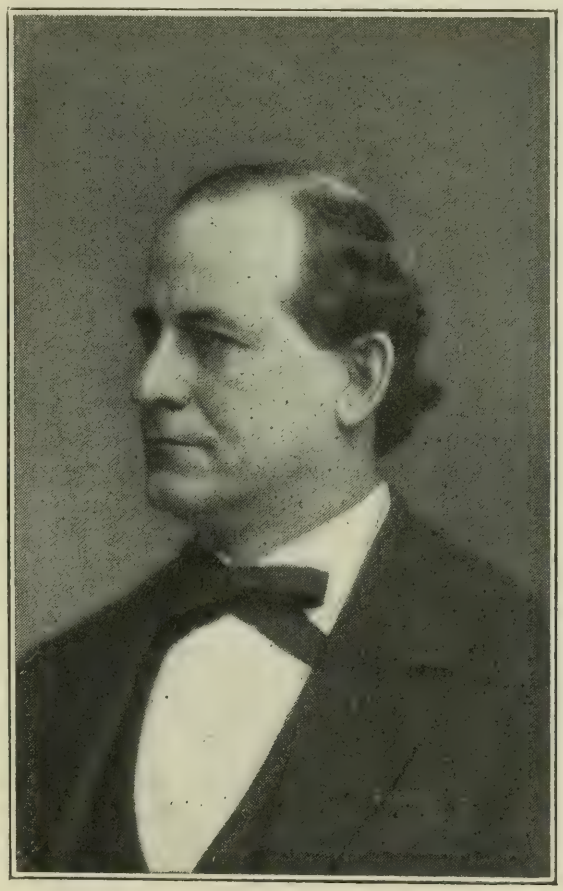
"We are both in good health. Raisuli does his best for us. It is very encouraging to know that you and others of our friends are acting on our behalf. We do not know what demands Raisuli is making, but he asks nothing personally from us, and my impression is that he wishes to make it a purely political business and that he means no harm to come to us."

The prisoners are in the mountains within a day's journey of Tangier.—It is reported that Spain will agree to the new *régime* on the following terms, which will shortly be embodied in a treaty between these two Powers:

"The signatory Governments do not purpose to change the political status in Morocco, but to define their respective spheres of influence in accordance with the terms of the Anglo-French treaty. Spain adheres to the Anglo-French treaty, especially in regard to the thirty-year period of free trade and the prohibition against the erection of fortifications. France recognizes Spain's right to maintain order in Northern Morocco from the left bank of the Moulouia River to the right bank of the Sebu River, extending inland to the lesser Atlas range and to the right bank of the Kouss River. Details of the boundary shall be settled later. Tangier, Arzila and El Araich shall remain free ports."

Muley Ahmed, or Raisuli, as he is called, was a student in the schools of the Beni-Arus until some twelve years ago, when he organized a band and began to levy tribute on caravans. Now he aspires to become an important chief among the Moroccan tribes and hopes to secure by this daring act of brigandage a territorial concession. He is a descendant of Lallaer-Raisul, a daughter of Muley Abd-es-Saham ben Meshish, the venerated ancestor of most of the sherifs of Northern Morocco. His chief strongholds are at Tazerout and at Zinat, between Tangier and Tetuan.

The Herero Rebellion



The main body of the German forces, numbering about 1,800 men, are now ready to take the field against the Hereros in German Southwest Africa, and the Governor, Colonel Leutwein, will proceed to Osire, about 60 miles north of Okahandja. From this point he will attack the natives at Waterberg, while another force, under Major von Estorff, will advance upon them from Okamatangara. Lieutenant von Zülow is marching from Outyo with 200 men to a point north of Waterberg with the intention of attacking them in the rear, or at least cutting off their retreat toward the north.

The Democrats and the Presidency

IV.—TWO PERILOUS POSSIBILITIES—BRYAN AND HEARST

[This concludes the series of "The Democrats and the Presidency," by our anonymous Publicist. Our readers will find this article as interesting and illuminating as any of its predecessors.—EDITOR.]

SEVERAL years ago a young man migrated from Illinois to Nebraska, carrying letters of introduction with him. One of these was addressed to the late Mr. Morton, who afterward became Secretary of Agriculture in President Cleveland's second Cabinet. The letter said that the bearer had begun the practice of law, but finding it slow work to get a foothold in or near his own home, thought he would like to settle in a newer community and grow up with it. Mr. Morton took an interest in giving the youth a starting chance, and watched over his progress in a fatherly way.

WILLIAM JENNINGS BRYAN

But practice came as slowly in the new community as in the old, and by and by the young man was after Mr. Morton with a further suggestion. He did not enjoy the drudgery of the law, he said: the speech-making was all he cared for, and he felt that he had a gift for this; but he could not get enough jury cases to keep his talents employed or his exchequer full, so it had occurred to him that he might supplement his regular work at the bar with a little lecturing, and wanted to ask a bit of friendly advice on the subject.

"Probably it would do no harm to try," said Mr. Morton. "What subject did you think you would lecture about?"

"That's just what puzzles me," was the answer. "I did not know but that you might have some suggestion to offer."

Mr. Morton had none at the moment, but a few days later he hailed the would-be lecturer. "Professor Sumner, of Yale, has just sent me a copy of his new book, 'What Social Classes Owe to Each Other,'" said he. "That might help your search for a topic."

The young man borrowed the book, and soon returned, jubilant. "The very thing!" he exclaimed. "I have now my field and my inspiration. You must come and hear me." The invitation was accepted out of curiosity. The lecture was mostly an enlargement of Sumner's work, and clever enough in its way; but Mr. Morton was taken somewhat aback when he discovered that the orator had touched only one side of the subject—what the rich man owes to the poor, the employer to the employed—and had no intention of ever presenting the reciprocal phase.

Thus unwittingly did Julius Sterling Morton, champion of sound finance and conservative government, set William Jennings Bryan up in business as a radical and reformer. Was the hand of fate ever more manifest?

There is no doubt that, next to a good voice and a keen histrionic instinct, what

has done most for Bryan's success in the worldly sense has been his faith in himself. He does not question in the least—he never has questioned—that he had a mission; and tho he may have had to grope a while at first to discover what it was, he has made it profitable enough ever since to pay him for this period of anxious uncertainty. It is no derogation of his sincerity that he has cultivated the art of turning his destiny into dollars. He inherits his assurance from his father, a worthy citizen and an honest judge of the inferior bench of Illinois, who used always to open his court with a prayer for divine guidance in his rulings through the coming day. These rulings, tho rendered in full faith that they were inspired, were nevertheless reversed again and again in decisions of the Supreme Court on appeal. When his attention was called to that circumstance, he waved the base inference aside with the declaration: "Well, I know that the Supreme Court is wrong and God is right!" And nothing could move him to any other view.

This will explain why, in spite of his many published denials of his desire to run again for the Presidency, there are still a multitude of Democrats who look to see William J. Bryan suddenly picked up and nominated. Without analyzing their reasons, they are simply conscious that he has been a favored instrument in the hand of fate; and what more natural that, when the rival candidates are tired out with their contest among themselves, he should treat the country to another surprise?

Tactically speaking, the Democrats would hardly do a more perilous thing than to put Bryan to the front at this juncture. The fight of the coming fall is not going to be over principles and policies, but over men. The two great parties, instead of dividing more widely in opinions, have been obliterating a good many distinctions that used to exist. Within the Republican ranks there is a strong and growing sentiment for tariff revision, while with the upspringing of a new industrial life in the South and West the Democrats have come to take much more charitable views of protection. The abundant flow of gold into the treasury and its rediffusion through the channels of trade has killed the silver issue. Both parties are clamoring alike to be known as the "friends of labor." Both have learned to restrain any impetuous yearnings they may once have had for more civil service reform. Neither is prepared to force the question of immediate freedom or permanent retention of the Philippines, and the faint menace of a storm over Panama disappeared with the first breeze that brought promise of an early canal. Narrowed down, therefore, the contest this year must be between candidates rather than parties—between the augury of a conservative administration and the assurance of a progressive one.

How would Bryan's personality fit such a situation? In age he is so little removed from President Roosevelt that nothing but the harder conditions of his life during the last eight years gives him any advantage of maturity, even in appearance. Roosevelt meanwhile, with all his native boyishness, has been steadily sobering in view and habit under the weight of responsibility; Bryan—who, thanks to the results of two elections, has remained his own master—gives no sign of having modified his radicalism of opinion, and preserves all his old personal prejudices intact, even to the verge of threatening revolt in case his factional foes press him too hard. The worst of Roosevelt's emergency actions have presumptively been witnessed already, and their effects distributed; and the sins of omission and commission which have been charged to his anxiety to succeed himself would not be repeated during a second term. Hence, in the judgment of many cautious citizens, a shift to Bryan now would be a flight from familiar ills to others that we know not of. For that reason he does not seem like a formidable candidate for the Presidential nomination in these days of Democratic caution.

Mr. Bryan looks like the late Samuel J. Randall. He has the same square face, the same large, horizontal, unindented mouth, the same broad forehead with the hair well trained back from the temples. He obviously "makes up" for Randall, his dress being patterned after the noted Pennsylvanian. The only thing Bryan cannot forgive in Randall is his living and dying a protectionist, because that breaks the spell of an illusion which otherwise might have been complete. But

Randall, being a man of action as well as speech, had in him a heavier quality of Presidential timber than Bryan. The latter is essentially a speaker and that alone; in Congress, altho a marked man after

The Outcast.

From the *Globe* (New York)

for fear of his doing something so injudicious as to ruin his chances. When, as an ex-standard bearer, he was looked to for advice in party management at large, his plans had usually to be overhis first ambitious effort in debate, no suggestion was made of his practical fitness for leadership, as in the case of Bailey, of Texas, for instance, another young man with a good voice and a gift for putting things. When Bryan plunged into his own campaign in 1896 it is an open secret that the management had to keep him constantly under the lifted rod ruled; when the Spanish war gave him his opportunity, he made so ineffective use of it that his military title is to-day a subject of jest among his friends; and in the one instance after the war when the Democrats heeded his counsel, and permitted the treaty of Paris to go through the Senate with the idea of settling the Philippine question later, they fastened a

From the Brooklyn *Eagle*

colonial system upon the republic, and stripped their party of its only available issue. In the character of a doer of deeds, therefore, it can hardly be said that Mr. Bryan has proved so large a success as in that of an utterer of thoughts. What he would have done in the Presidency if confronted with the crisis caused by the destruction of the "Maine," or later with the anthracite coal strike, it is impossible to guess from any evidence he has furnished us in the rest of his career.

Mr. Bryan has some appreciation of fun, but little sense of humor. The distinction will be understood better when I explain that he can tell an amusing story in illustration of a point he is making in a speech, whereas his instinct for seeing what is ridiculous in himself, or in others, or in a situation, is dull. He takes himself with deadly seriousness, being unable to distinguish between what is deep-seated in his own nature and what is purely spectacular. Were this not true, he could never have made use again and again in public places where listeners would remember its sound and reporters would take it down for presentation in print the simile of the crown of thorns and cross of gold. I myself met with it

in at least two of his productions before the convention season of 1896; I heard it at Chicago; I knew what was coming when he began the first clause of that fateful passage. And if I, why not a multitude of others? It is a large risk an orator runs when he tries the same electric effect on so many audiences in succession.

But Mr. Bryan's self-confidence is supreme as well as sincere. It covers every field he enters, and every undertaking to which he lays his hand in that field. A friend who called upon him at his house in Lincoln during the first campaign describes the simultaneous visit of a committee from a small manufacturing town in Iowa, to invite the candidate to speak there one evening. Mr. Bryan was full of gratified surprise that so rock-ribbed a Republican stronghold should show signs of conversion in the midst of his campaign, altho it had turned its back upon every former Democratic nominee. The committee smiled politely while they negotiated for a convenient date, but privately admitted to my friend afterward that their town had not changed its partisan complexion by so much as a shadow; all it wanted was a "show," to which the country people would pour in for miles around. It had sent for Bryan, the most notable figure of the summer, as it might have sent for a trick elephant

WILLIE HEARST:—"Oh, I'm out of it am I?"

From the *News-Tribune*, Duluth, Minn.

or a horse with two heads. His flattering interpretation of the call was a pure gratuity.

If William J. Bryan is a perilous possibility because he would not present the contrast with Theodore Roosevelt that seems to be demanded by the present political exigency, William R. Hearst must be so regarded for an opposite reason: he does present a marked contrast in two important particulars—his lack of faith in himself and his lack of faith in mankind. As to the first quality we have the testimony of expert interviewers who have repeatedly tried it, that Mr. Hearst is the hardest man in the United States from whom to get a statement on any subject for publication. This is not due to his desire to reserve to his own newspapers the promulgation of his ideas, because in some cases certainly the subjects suggested have been those which he would not discuss in columns controlled by himself. His closest friends attribute his reluctance simply to shyness and say that he manifests the same spirit when invited to meet strangers socially. He cannot communicate with the world except from behind a breastwork of print, and through the muzzles of pens under his own command. This will doubtless explain why, up to the present writing, Mr. Hearst's career in Congress is adorned by no speeches. If Mr. Bryan's forte is brilliant oratory, Mr. Hearst's is scintillating silence. The adjective is chosen purposely, for the public is kept continually on an anxious edge, waiting for the larger flashes and accompanying shocks that never come.

From the Chicago *Tribune*

What Mr. Hearst lacks in the way of public speaking he might claim to make up in a gift for tactics. He has his little group of field marshals in Congress, and to them, when any matter is afoot in which he takes a special interest, he issues his orders on the floor. It is they who ask the questions, and make the motions, and do the talking on them. He is as indifferent, to all appearance, as any one of the spectators; but as a skilled chess-player can dictate moves when blindfolded and keep the board and the men and the enemy's possible game in his mind like a kaleidoscopic picture, so Hearst seems to know by instinct what is needed at each juncture, and to whom to apply to furnish it. All his work in this way is directed at forcing the hand of the Republican side of the House, and compelling it to take some stand which can either be used against it in the coming campaign or is an admission of the righteousness of the position of the Hearst Democratic faction.

Mr. Hearst's activities in Congress, as in his newspapers, are aimed at giving organized labor the largest advantage. Measures against convict competition, for reducing the length of the working day and the like, absorb his entire attention. Some of his pet schemes would produce an industrial revolution if put into practice, but that is something he does not worry about; he is there not to find difficulties, but to feed the masses with what they want, and to make William R. Hearst the idol of an army of *protégés*.

And he is succeeding in this latter endeavor, much to the surprise of men who have always believed that workingmen of the higher class could distinguish easily between natural and machine-made interest in their condition. I was talking

about this the other day with the most intelligent labor leader I know, a Roosevelt Republican at that.

"It is a fact," said he, "that William R. Hearst is the Democrat from whom our party has most to fear to-day. What the workingmen want is legislation. They do not scrutinize the ulterior motives of the man who goes in and gets it for them."

"You have no idea of his succeeding?"

"In procuring the nomination? No. But in making himself so strong in convention that he may command the pledge of a Cabinet portfolio, yes. And should he ever become Secretary of Commerce and Labor, with both the investigation of the trusts and the administration of the labor laws committed to him, you may look for some original developments."

Let no one, therefore, blunder into supposing William R. Hearst a fool because he makes so little of his opportunities to speak directly to the people. He is a man of ideas, and he manages all his newspaper ventures, widely scattered as they are in point of miles, with his own brain and hand. At the close of a day's work, wherever he may be—in Washington, New York, Chicago, San Francisco, Boston—he stands by the telegraphic key and watches it tick off the messages in which he orders one subject "featured" and another condensed to the narrowest span of space; this man praised for a great stroke and that one denounced for a failure; the personalities in a rival newspaper fired back with interest; a new fund started for some enterprise of charity or glory; interviews sought with one and another person of note, and the like. He even occasionally directs what the first line of a "scarehead" shall be, or the closing words of an editorial leader.

Neither, because one sees here and there a writer taken upon his staff, wrung of what is best in him, and tossed away like a squeezed orange when no longer useful, must it be inferred that Mr. Hearst is a heartless taskmaster. He comes of too good stock for that. His father was a man of strong character, self-made, little schooled in the refinements of life, but kindly, and living up to the best lights he had. His mother is the soul of generosity, and a woman of high ideals. The son himself has a side so generous that good men who have worked for him have found themselves almost unable to cut loose from the association. No one who has proved all that he represented himself to be has ever suffered, I am told, through Mr. Hearst's ingratitude. The wrung and discarded contingent is composed of men who voluntarily undertook a large job with meager intellectual assets, and failed at it. For these Mr. Hearst has as little sympathy as for people who go into banking with the capital suited to an apple stand. What they have is soon gone, and they have only themselves to blame when they drop out. He buys brain fiber as other merchants buy dry goods and hardware, and any man who has proved his employer's safe reliance for years may feel reasonably secure even after he has passed his best estate.

I have spoken of Mr. Hearst's lack of faith in others. This manifests itself in his assurance that money will buy the fruit of any man's effort, and that the sole consideration with most men is the amount they can command. Some time ago a young writer applied to him for employment on his New York newspaper, and was engaged to fill a position which would become vacant at the end of a week, but in the interval the fact came to the attention of a university professor who had always taken an interest in his advancement.

"I am sorry," said the good man, "that you should have chosen that particular school of journalism for your professional start." And he proceeded to descant upon the responsibility a journalist owed to society, the influence of one educated youth's example upon others of his class, the tone a writer inevitably took from the character of the journals he worked for, etc. "And your untarnished sense of self-respect, my young friend," he concluded, "will be worth more to you, when you reach my time of life, than all the salaries an unprincipled employer can pour into your purse."

So impressed was the neophyte with this lecture in morals that he called upon Mr. Hearst the next morning and announced that he had changed his mind about accepting the proffered position.

The editor scanned his face shrewdly, and then inquired the reason. After much hesitancy the young man told him the whole story, and started to leave.

"Ah!" said Mr. Hearst. "Be seated a moment, please." And turning to his secretary, he added: "Write a letter at once to Professor X. Y., present my compliments, and say that I should be pleased to receive from him a signed article of five hundred words—subject and treatment to be of his own choosing—for the editorial page of next Sunday's paper. Inclose check for $250."

"Now," he remarked, with a cynical smile, as he bade his caller good-by, "you can see for yourself what comes of that."

He did. The Sunday issue contained a signed article, which gave the paper the reflection of a good man's fame, and spread the influence of his example among other university professors, and — did what to his self-respect?—all at the net rate of fifty cents per word!

WILLIAM RANDOLPH HEARST

Is it wonderful that Mr. Hearst catalogs humanity by its price-marks?

I have spoken of Bryan and Hearst as perilous possibilities. It seems to me that the nomination of either at this juncture would be fatal to the hopes of Democratic success for the next eight years, for no party recovers from a bad blunder at once. Bryan, who has figured through two Presidential terms as a pleasing speaker lacking the power to convert his own philosophy into successful action, would labor under the disadvantage of a promise too long unfulfilled. Hearst, not trusting himself to speak at all, cannot gain his first entry into the hearts of his fellows through their ears; and, tho some poor speakers have become Presidents, no party ever forced a voiceless candidate into the White House. Moreover, entirely apart from an unmentionable class of personalities with which the campaign is menaced in the event of his nomination, the view Mr. Hearst takes of his fellow man —warranted tho it be by much of his experience—would stand seriously in the way of his success, for the question in every voter's mind would be: Is this the proper basis for an administration of the affairs of eighty million people, mostly decent?

After all else has been said for and against the pair of "possibilities" mentioned in this paper, it must be admitted that both have contributed a larger share than any other two men to a most important phase of our country's economic development. The war upon the trusts, popular revolt against a corrupt alliance between the Government and the money power, was first raised to the dignity of a national issue by Bryan. It has been powerfully advanced by Hearst in his circlet of newspapers, and is now passing through the same succession of stages that marked the war upon negro slavery a half-century ago. In those stirring times it was the agitators who kept the world thinking. One, an orator, would dig the nose of his reform plow into the sodden public conscience and turn over the heavy clods; another, an editor, drove his newspaper harrow this way and that, up and down, backward and forward, over the broken earth, every day crumbling it finer and making it more ready for the seed. Af-

ter them, but only after them, came the calmer reasoner to sow the seed and the steadier executant to cut and garner the matured crop of righteous resolution. It was a Phillips and a Garrison who prepared, through much tribulation, the way for the final triumph of a Lincoln. Had either of these radicals became President, who can say what would have happened to the country? But, on the other hand, had it been left to Lincoln and the statesmen of his type to set the abolition propaganda going or keep it alive, might not the fugitive slave law have still remained an active statute?

Every man to his part, and to each be the credit for whatever he does well. In the history of the war upon industrial slavery, tho others may figure as the heroes of the crowning achievement, Bryan and Hearst, in spite of their idiosyncrasies, must rank for all time as leaders of the first endeavor.

Women's Suffrage in Australia

BY LADY HOLDER

[Lady Holder is the wife of Sir Frederick W. Holder, K. C. M. G., Speaker of the Commonwealth House of Representatives, and has for many years taken an active part in public life. She is President of the Woman's Christian Temperance Union in South Australia, and Australasian President of the Franchise Department of the W. C. T. U. —EDITOR.]

THE women of South Australia, in which State I live, were placed in a position of political equality with men several years ago. Accordingly everybody has become accustomed to the arrangement, and it seems to be perfectly natural. It has not produced any marked effect on female character or made any particular difference to domestic life. It is true that women are more interested in public affairs than they used to be and that politicians deal more earnestly with home and social questions, but no neglect of private duties on that account can be laid to the women's charge. We are well supplied with high-class newspapers, the same sources of information are open to women as to men, and the questions that arise are not by any means beyond the scope of their intelligence. At election meetings there is commonly a good sprinkling of women voters in the audiences. It is said that their presence tends to prevent disorderliness, and I have never heard of a lady at any meeting being rudely treated. Voting, with us, is one of the simplest things in the world. When an elector's mind is made up there is less difficulty in expressing it through the ballot box than in matching a ribbon, and the one act is not considered more unfeminine than the other. Our freedom has not developed a class of political women, we have no "shrieking sisterhood" as the result, no lady candidate has ever contested a seat in the State Legislature, but we know and use our power. We can do a great deal toward securing members of good character in the Parliament and influencing their votes, and are generally content with the results of our enfranchisement.

I have described the conditions in my own State thus fully because, tho it is one of the smaller States in the Australian Commonwealth, in this matter it is further advanced than most of the others. When federation came adult suffrage was the law only in South Australia and Western Australia; it has since been adopted in New South Wales and Tasmania, but it has not yet been granted, so far as the State Legislatures are concerned, in the other two. The Federal Parliament, however, had to make its own electoral laws, and to establish uniformity was obliged to adopt the broadest existing basis, because the constitution forbade the outrage and anomaly of disfranchising persons by whom some of

its members had been elected. Accordingly the women of New South Wales, Victoria, Queensland and Tasmania were somewhat suddenly placed in the same position of political equality so far as the Commonwealth is concerned as their South Australian and West Australian sisters. They were legally qualified to act in the Federal elections of last December, and as they had not then been allowed a similar privilege at elections for their State Legislatures, of course the event produced considerable sensation and wore an air of strangeness and novelty.

As there were only a few months between the passing of the franchise law and the actual contest, the political education of women to fit them for their new duties had to be rather hurried. A number of political "leagues" and "associations" were formed in various localities, and in connection with them many ladies of position, education and intelligence rendered excellent service. The meetings that were held and the literature that was distributed diffused a large amount of information of a preparatory character. The newspapers gave special attention to the new class of voters and teemed with exhortations as to the way they should go, which, tho sometimes contradictory, helped the general understanding. When the campaign was entered upon the candidates vied with each other in wooing the political affections of their female constituents, and it was amusing to observe how some of those who had fought against woman's suffrage with all their might tried to show their supreme regard and esteem for the voters whose rights they had previously refused. The effect of the whole was that by the time polling day arrived the average woman was probably as well prepared and competent to discharge her electoral duty as the average man.

Three women offered themselves as candidates, Mrs. Martell and Mrs. Moore in New South Wales, and Miss Vida Goldstein in Victoria. The candidature of the two former was not by any means cordially or unanimously approved by the Women's Association of their own State, and their defeat was a foregone conclusion; but Miss Goldstein was indorsed by the Victorian organization to which she belonged, and, tho unsuccessful, the fact that she received 51,497 votes proved that she had many sympathizers. Miss Goldstein had previously been the most politically active of the trio, she worked her campaign thoroughly, and her experience, therefore, is the most instructive. It was objected at the time that she did not ally herself with either of the great political parties, but her answer was that she stood to protest against dictation by the press, and the ticket system of voting, on behalf of the cause of women and children. Her greatest object was avowedly to show that home interests ought to be represented in Parliament and by women, as well as manufacturing, mining, farming and other interests by persons who were engaged in them. Accordingly she regarded such issues as the fiscal question and preferential trade as subordinate, which, of course, lessened her chances of success in a party struggle. Next to the votes she received at its close, the most significant thing about Miss Goldstein's electioneering work was the considerate and respectful treatment she met with throughout. Only once during a three-months' campaign was there an exception, when, at the close of an address to 1,400 people, questions being asked for, three were handed up in writing which Miss Goldstein, having read, described as insulting and refused to answer. She has since said that immediately every man in the great crowd was on his feet, and the hall resounded with cries of "Throw him out! the cur! Insult a woman! the hound! Chuck him out!" But at her appeal the incident was allowed to drop. It showed that the political woman who respects herself may trust for protection to the chivalry of the men. Miss Goldstein believes more men voted for her than women.

Australian experience has conclusively disposed of the objection that women have no aptitude for politics or interest in public affairs. They have proved that they possess both, and while they have no general ambition or desire for parliamentary honors, and display no sex antagonism, they regard their right to vote for representatives as a responsible trust. It is rendered equally clear that they can and do exercise a salutary influence on the political life of the country without sustaining in the slightest degree

any of the injuries or disabilities that have been supposed to follow. They are as good wives, mothers and sisters as ever, and better companions for their men folk because of their widened interest and the truer equality in which they stand. Many complaints were made of public apathy when the late elections were held, but there is no reason to believe that it was greater among the women than the men. Meanwhile their political education is proceeding in the States where adult suffrage is new by the organizations being kept alive that took this work in charge. The women are not going to be regarded as uninformed or ill-equipped, and future elections will show the result of their determination to intelligently use the power they possess.

KENT TOWN, SOUTH AUSTRALIA.

Growth of Commercialism in Politics

BY HON. BIRD S. COLER

FORMER COMPTROLLER OF NEW YORK CITY

THE conviction in the Federal courts of a Senator of the United States and of a former member of the House of Representatives, of crimes of which the plain English name, or description, would be the use of their official positions for purposes of corrupt personal gain; the infamous record of the last session of the New York Legislature in passing bills to enrich individuals at the expense of the people as a whole, should serve to bring home to the voters with startling and effective force a realization of the rapid and dangerous growth of the spirit of commercialism in American politics.

The Legislature of the State of New York at the session recently adjourned carried the new system of politics beyond the danger line. The passage of a bill to prevent the city of New York from going into certain territory for an additional supply of pure water was a measure in the interests of a private corporation. There was no attempt to conceal that fact. The enactment of one such bill may to the indifferent observer seem a small matter. But in principle it was commercialism in politics grown bold enough and criminal enough to endanger the physical life of the second city of the world in a deliberate attempt to force that city to enrich a few individuals.

The Governor has signed the measure and it is now law. I shall not charge the Governor with improper motives or intentions, but he has placed upon the statute books of the State the beginning of a system of legislation so dangerous in principle that it should be fought through all the courts of the land if that course shall be necessary to check it in time. The system carried to its logical conclusion would imperil every municipality to enrich individuals.

The bill to which I refer was passed in the interest of a private water company, a company that will succeed or fail as a business venture by the dishonesty or the honesty of future legislators. If the first measure in the interest of this corporation can become a law without arousing a storm of protest from honest men, other and more dangerous bills in the interest of the company will be passed from time to time, until finally the city, walled in by human greed and political commercialism, will be forced to surrender to the new system and pay tribute for its life. This is no colored word picture, no exaggeration whatever. The commercialism of legislation has grown too strong to be rebuffed. Those who train and encourage it because they thrive on it are always on the alert. They know that public opinion must receive a rude and sudden shock in order to become thoroughly aroused, so they are cautious and at times slow in their movements in order to keep the people quiet.

And the dangerous feature of the situation is that this commercial spirit that pervades politics and government has spread from cities and villages to the National Capitol. It is everywhere in evidence in some degree of development. The Legislature had just adjourned, after a session that will forever remain notorious in the political history of the State, when persistent rumors and accusations of demands for bribes made against the New York City Board of Aldermen forced that body to appoint a committee of its own members to investigate the charges, and the District Attorney began at the same time an independent investigation.

Corruption in politics and public office is undergoing changes due to evolution. Rapid and skillful development of the system means danger to the people and to the public welfare that is hard to combat. The people may arrest and convict a thief, public or private, if he works in the open or by the old methods. But personal gain by the power of public office may grow behind screens of respectability, custom and official courtesy, until the foundations of honest municipal, State and national government are undermined and endangered before the people are aroused.

Following the Civil War there was developed in this country a system of robbing municipalities, States and nation that was little better than the methods that prevailed in the ancient times known in history as the "Dark Ages." The system was plain stealing—theft in the open. The end of the carpet-bag *régime* in the Southern States, the breaking up of the Tweed Ring in New York City, the exposure of the Credit Mobilier and the Star Route frauds put an end for all time to the old methods of robbing the people through the public treasury. But the spirit of getting something for nothing was not crushed.

The survivors of the wreck of direct and flagrant corruption in public office, forced to take time to reflect and think, did not reform. They made plans for the betterment of the old methods. They planned the system of commercialism in politics which has been developed until it is to-day the gravest danger that threatens the Republic of the United States and the subdivisions thereof.

Men now grow rich in a few years in politics or public life and yet believe that they are personally honest. They do not take bribes in cash, but their votes and influence bring about legislation or official acts that benefit the business or financial interests of persons and corporations. For this work they receive stock in corporations perhaps, or advance information of financial movements that enables them to make money easily. This condition could not exist without collusion between the lawmakers and the men in charge of great business interests. The latter are probably the greater moral criminals of the two.

The exposure of the St. Louis group of "boodlers" by Circuit Attorney Folk disclosed the inside working of the modern system of corrupt politics. When there are bribe takers there must be givers of bribes, and Mr. Folk soon found that the officers of great corporations in St. Louis were buying legislation and special favors over honest competitors. The system there was widespread and almost open. In other places it is perhaps better concealed, but the principle is the same, and the system will not be destroyed by the occasional breaking up of a city or State ring. It is too well established, too safe for those who play it.

A few years ago, very few, a prominent member of Congress from one of the great cities went to his party leader at home and suggested a policy to be followed by the city delegation on a great public question.

"Will it do any good?" the leader asked.

"I think it will help the party," the Congressman replied.

"I don't mean that. What effect will it have on the stock market?"

"None."

"Then do as you please about it."

The party leader who said this was never accused of personal dishonesty, yet he made a fortune in a few years. He followed the letter and spirit of commercialism in politics. The public welfare did not concern him and he had no interest in legislation unless it benefited trade.

So long as this system, in its effect on legislation and other official acts, merely injured one corporation or individual for the benefit of another it was difficult to

arouse widespread indignation or protest. But new conditions have developed that should speedily stir public opinion to the stage of action. Legislatures now rob great cities of important rights for the benefit of corporations and individuals. In brief, the growth of commercialism has reached the danger point. It is poisoning the lifeblood of politics and government, and it is sapping the vitality of sane and safe public opinion.

Within the limits of this article it is not possible to go into details of all the recent State legislation that was based solely on private gain and the advancement of the system of commercial politics. The story of the hideous scandals in the Post-Office Department is still fresh in the public mind. Every intelligent voter in the State of New York knows that the bulk of the larger work of the last session of the Legislature was in the interest of private capital, not for the public welfare. The same conditions prevail in other States. The "boodlers" of St. Louis, exposed by Mr. Folk, were merely better organized, bolder and dealt in larger sums than their comrades or imitators in other cities. The system is everywhere the same. It permeates every State and city government to some extent, and it recent growth at the National Capitol has in a measure startled the country.

A few years ago a member of Congress in his first term, a man who had served in the Legislature of his State, said to a friend:

"I don't like the game in Washington. Do you know a Congressman gets only his salary? When I was in the Legislature there was always some business on the side."

Had the man who made this statement been able to serve two or three more terms he might have sold something to the Post-Office Department. Commercialism in politics has in recent years grown faster than the tariff promoted export trade of the country. To-day there is "business on the side" wherever there is power to legislate for private individuals or corporate interests.

The remedy for this dangerous and deplorable condition of American politics and legislation is simple, but its application is a slow and difficult process. The remedy is publicity and aroused public opinion. The people must act as well as watch, and they need to watch all the time. When public attention is attracted to the National Capitol by a scandal there the commercial spirit in a State Legislature becomes active. When the public spirited citizens of a great city are busy watching a Governor and a Legislature, their local authorities may be secretly planning vast commercial deals to be paid for by the local taxpayers. When national attention is directed to foreign wars or other great events, then comes the harvest time of those engaged in commercial politics. The system cannot be destroyed or seriously checked by changing political parties or disrupting them. Let every honest voter take an active personal interest in politics and public affairs every day in the year. That is the remedy for the system that is rapidly making legislation and government matters of barter and sale.

New York City.

Leclaire's Progress

BY N. O. NELSON

[Mr. Nelson's last article in THE INDEPENDENT, in which he described his home for consumptives in the Western desert, and invited all who wished to come and live on it, excited a great deal of interest among our readers. Mr. Nelson tells us the article "has already cost me $500 or more to make room for THE INDEPENDENT's patients, and no telling when it will stop." The following article tells of the recent progress at his home village of Leclaire, where for the past few years he has furnished to all American manufacturers an example of how an employer should treat his employees.—EDITOR.]

A FEW years ago you asked me for an account of Leclaire, and I gave it. I will now, of my own accord, report progress.

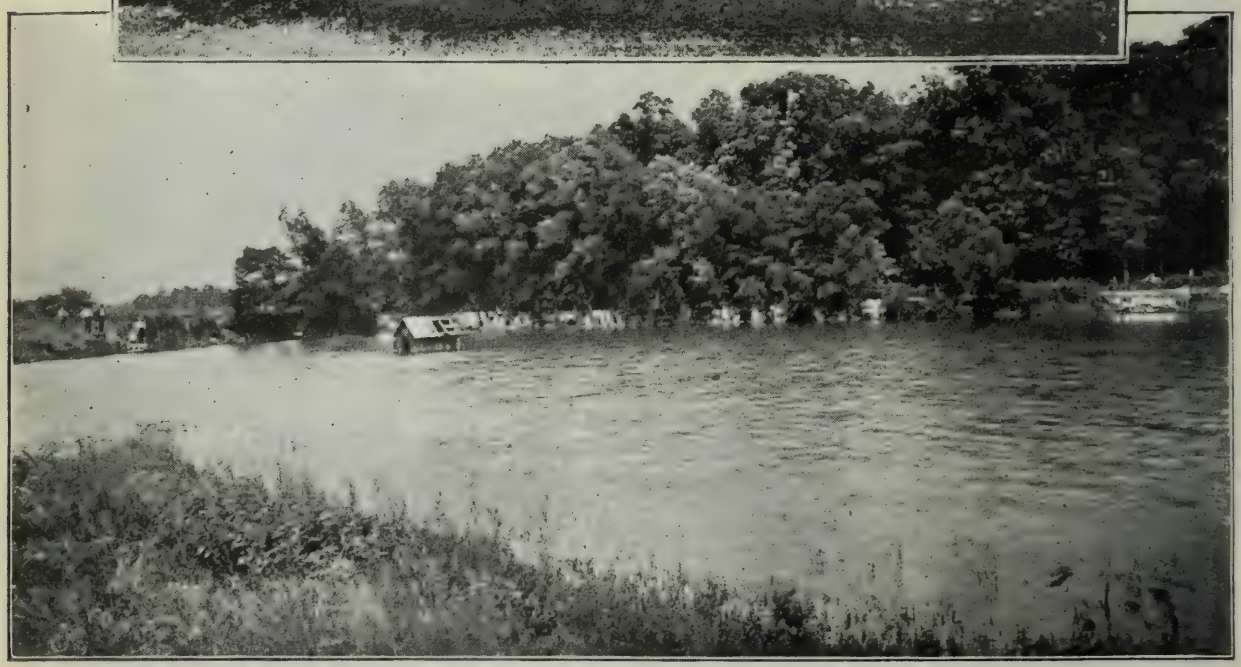
Leclaire, your old readers will remember, and the new ones must be told, is a factory village where the proprietor and workmen live neighbors and enjoy together the common pleasures, such as lectures, bowling, dancing, skating; where their children grow up on even terms, knowing no class distinction; where there is plenty of room, the homes "owned," the streets and public grounds kept out of the "profits," and where there is no saloon, no police, no rules or "don't" signs, and no boss. We are free and natural folks, not perfect, but we behave in a neighborly and orderly way.

Leclaire is a suburb of Edwardsville, Ill., which is its post-office and railroad station, eighteen miles from St. Louis. We have 125 acres of high, rich Illinois prairie land, on which we have factories employing 250 men, school-house and hall, a bowling alley and billiard room, a ball campus, a lake and homes—not mere houses—homes that are built on third acre plots, filled out with lawn, flowers, shrubbery, fruit trees and kitchen gardens. We have lectures and concerts throughout the winters.

Do not, gentle reader, take this for a description of Elysium. These material and intellectual conditions are here. Conditions have a marked influence on character and some influence on happiness, but don't ever forget that the Kingdom of God is within, that a multitude of Things never make happiness. In a common sense way Leclaire gives the opportunities—the men, women and children must use them. They have used them to good advantage; the children are a fine lot, it is a good place to live in, but, after all, we are simply folks.

Now for the progress. We have an Industrial School; perhaps, as we teach collegiate learning and do actual labor, we should call it a Working College—half-day study and half-day work, four and half hours each, pupils and teachers alike. The work pays (more or less) for the schooling and the living. Some years ago I talked this project over with a prominent educator. He assured me that parents would not send their children to school to work; they wanted their whole time devoted to education; neither would the pupils consent to do actual productive labor. The P. E. was mistaken. The parents are anxious to have work learned and also to have the self-support. The boys take hold of work, the commonest kinds, with as much interest and efficiency as they do the studies—not quite so much, we'll admit, as baseball or football or dancing. The age requirement is sixteen and over for non-residents, tho we make exceptions; for residents, thirteen to fourteen and over. We make no educational requirement, and therefore have much personal teaching and a large proportion of teachers. As we do not design to prepare for college or confer degrees, but develop character and intelligence and capacity, we allow considerable choice in studies. The languages and mathematics and stenography are favorites, but for educational more than utilitarian values. We do not allow many studies, rarely more than three or four. Because we are working students and teachers, we start as the factories start, at 7 o'clock, and quit at 12. The afternoon work starts at 1 and quits at 5. We work Saturdays, quitting at 4. It will require a leap of the imagination

from the conventional school week of 25 or 30 hours to the working week of 54 hours, but there is nothing hard about it. All healthy and industrious working people are up and around and doing something by 7, and we are of that class and intend to remain so. Our forenoon pupils, the oldest, have but 30 hours a week of school work, and the afternoons, the younger, only 23. In the other half day they get full relief in the exercise of work. It is the same with the teachers. The work is in the factories and on the farm and house building, when the weather permits. The first thing is to learn to work, work at any regular productive labor. There is a wide difference between playing at making things, or making artistic samples and curios, and doing the plain labor in creating the material for use that the world needs. An atmosphere of unreality pervades the making of things for mere practice in dexterity. The dexterity gained in productive work when joined with daily intellectual activity will, in a natural way, develop whatever artistic capacity the student possesses. It is a mere conventional caprice that classifies into mechanics and artisans and artists, that puts a premium on the artistic and a ban on the useful. A cornfield is as beautiful as a poppy-field, a well made quartered oak bookcase is as artistic as a Corot picture or a Wedgewood vase. When we read the innumerable and contradictory versions of what beauty is, we realize how conventional it is. We must form our own standards of beauty and also our own judgment upon its relative value, in comparison with utility and proportion and virtue and other life elements. The common life of the common people, so universally extolled by the great Sages and the great Publicists, has not thriven upon Art, but upon the common virtues and the utilities and nature's beauty.



Introduce the young mind and heart to an appreciation of the intrinsic beauties of form and color when going hand in hand with nature and with the common life and there will be a spontaneous ad-

The Campus

Leclaire Lake

vance toward honest ideals of art as apprehended by each individual. So far as the "cultural value" is concerned, no one element or influence in a school curriculum will go so far as knowing how to do things and doing them. I recently heard President Eliot say in approval of the course of study of certain new High Schools that shop work, drawing and music were surpassingly valuable toward making an educated man or woman. Such a one is prepared to do a full part in the pleasures as well as the work of life.

All of these we have in our school, and somewhat more. We have the innocent pleasures of bowling, tennis, skating and social parties. We have the popcorn and peanuts that we have ourselves grown and prepared. We have trips to St. Louis to the Art Museum, the World's Fair, the great newspaper plants.

The work that is done has the "cultural" quality of being real and serious, in full connection with orderly routine that produces the world's material supplies, alongside of men who know how.

The first lesson is to learn to work, to do it in a regular and methodical and efficient way. We need to redeem men in advance from the great army of incompetents. It is a great army, as every employer knows and every charity worker and prison official. The man or woman who can do something or several things well is rarely out of employment, and this holds good from the employments of the multitude to those of the advanced specialists, whether manual or mental.

The second lesson is to select a vocation and work into it. A youth learns something of his powers and also his privileges when he exercises choice of work. This choice of the immediate work is commonly shaped by his taste and learning as to his life vocation. As he proceeds this first choice will often be modified and sometimes reversed. Not only will his work and his studies develop new capacities and tastes, but the "cultural" element of the school will develop new ideals. These capacities and ideals must be met with open arms, there must be wide open opportunity ahead, always, however, joined with labor. This school is founded on useful labor and at no stage will this be abandoned. If we should adopt a motto or principle it would be "No true culture without labor."

Our pupils have come from Colorado, Arkansas, Kentucky, Missouri, Illinois, Pennsylvania and New York. They board in a house matronized by one of the teachers. Plain living and plenty of it; not much evening study, five hours is enough for the whole day. How commonly do pupils detest school because their heads are crammed with abstract nothings and their bodies are cramped when they want to be in motion. We have physical culture exercise and singing class in middle of forenoon, singing Wednesday evening, with a short dance; singing Sunday afternoon, with stories told from Tolstoy or originals; bowling Saturday nights, and an hour's dancing. At all of these functions the teachers are present and more or less of the Leclaire young folks. On Thursdays a neighboring physician lectures on the body and its functions, common sense information in plain and simple English of foremost value to the pupils and teachers and visitors. Some lectures we have on political economy—not of the strictly orthodox kind, rather of the Ruskin and Morris and applied kind.

On the farm of 85 acres we raise crops of eatables for our own use and some to sell. We build houses for the school and for Leclaire families. The teachers and I take a nearly full part in this labor. Doubtless you think it revolutionary for highly educated teachers and a capitalist of many affairs to labor, and do it in earnest—make things for use. But, really, it is quite natural and enjoyable. As exercise, it is better than golf or walking; as relaxation, it is better than whist, chess or books; as education, it is better than text-books. The pupils and teachers are there together as equals, the motive of the labor is rationalized, the monotony of it is turned into almost playful emulation.

My daughter is going into flower growing as a business, and such of the girls as prefer this outdoor labor will join her. Not all will prefer cooking, sewing, embroidery and millinery.

With our 4½ hours a day of productive labor we should make our living and expenses, which includes travel and art and literature and recreation. If a day of eight hours or less, with fair distribution and no parasites, will yield a proper

living for a family and proper public expenses, then our singles, when fairly broken in, should easily make a good living and school expenses in a 4½-hour day. To get away from dependence, away from endowments with "tainted money," away from the makeshift and menial devices for working through college, is among our chief aims. The working and educational "plant" may well be supplied by those who have gone before; the self-contained university of working students and teachers should then be easily self-supporting. Toward this the "Art" of doing without is an essential. To the high-soaring athletic undergraduates on $2,500 a year our living would be ascetic and contemptible; to the Scotch student, with his oatmeal porridge and homespun, it would seem affluent, if not sybaritic. The "Art" and the ethic of doing without—doing without the superfluous and injurious—needs teaching by example and text. The commercial school teaches "wants"—the more wants the more business, and the more profits and mansions and skyscrapers. Esthetics is inoculated with the commercial virus. Cost and rarity and exclusiveness are dominant elements in Art judgments. We prefer the ideals of the spirit, the joys of mind and heart which are indifferent to the profusion of the table or the wardrobe or the apartment. Neither ascetic nor sybaritic, we are firm believers in simplicity and in the necessity, the duty and the privilege of labor.

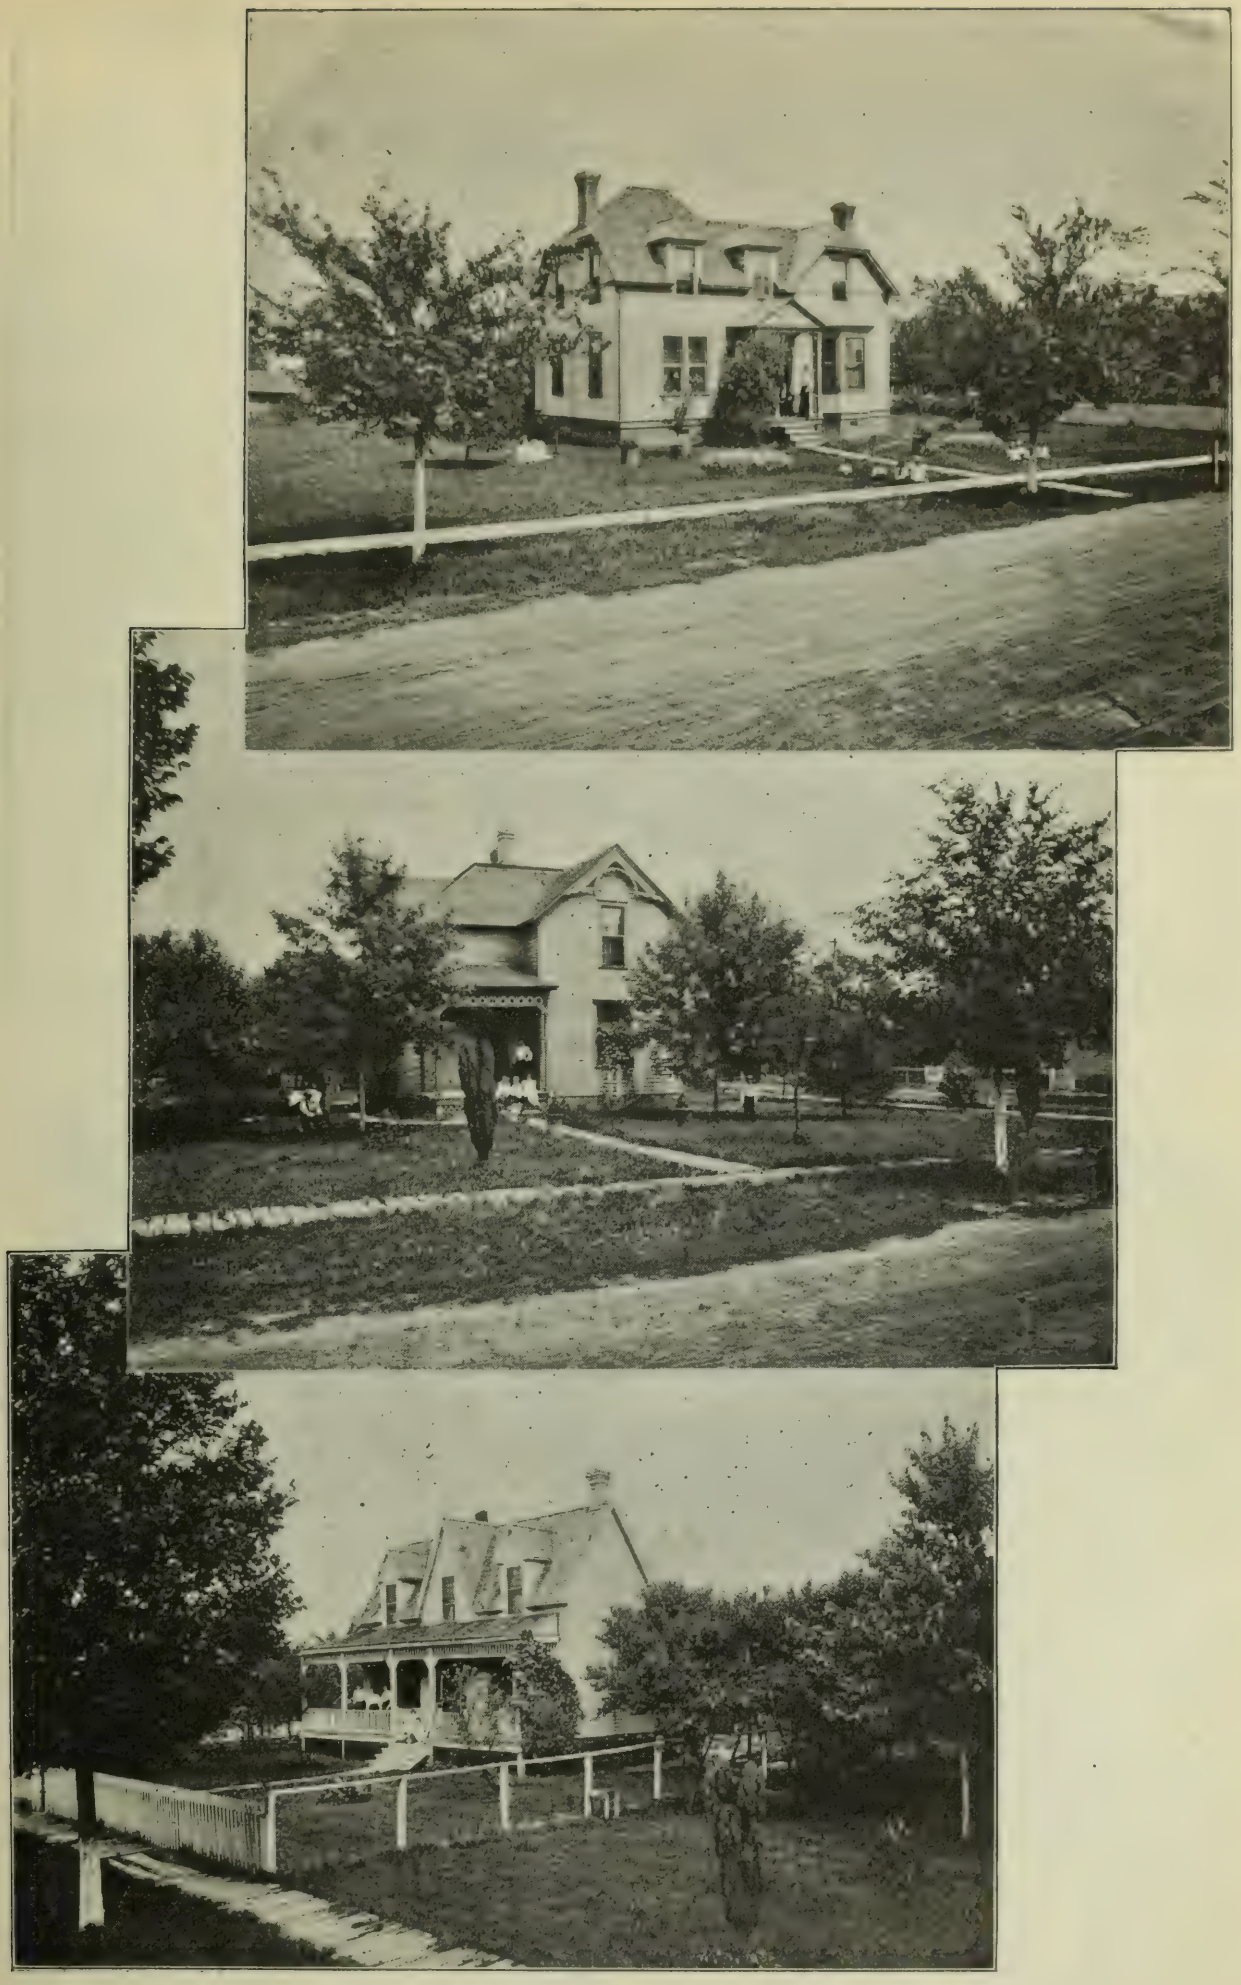
LECLAIRE, ILL.

The Last Survivor*

BY E. HANNAFORD

[A press dispatch suggests that the last surviving Union veteran will still be living in 1950.]

THE last survivor! Ah, who knows
What name shall heir that lonely fame?
Enough to know he was of those
Who, when the call of country came,
Went forth and, 'mid war-smoke and flame,
Followed the flag,
The dear old flag,
The starry emblem of the free,
And did his part,
With dauntless heart,
To bear it on o'er land and sea.



Unguessed he mingles with the throng
Of young and old, of grave and gay,
His years a vista growing long,
Till far it seems—how far away!
When grappling hosts of blue and gray
Surged round the flag,
The dear old flag,
And that proud emblem of the free,
All blood-besprent,
Still forward went
In line that stretched from sea to sea.

Ah, youth was strong and hope was high
When first he donned the Union blue:
Of comrades then how many lie
On fields which sealed devotion true,
While grandly o'er the torn ranks flew
The starry flag,
The dear old flag,
The glorious emblem of the free,
As still it waves
Above their graves,
In peace unvexed from sea to sea.

And year by year the comrades left,
They count more few and fewer still;
Yet in the shortening line, bereft
Of more and more who charged the hill
Or marched the plain, how high the thrill
That greets the flag,
The dear old flag,
The starry emblem of the free,
When o'er his head
Its folds outspread,
God's benison on land and sea.

Morocco and the Anglo-French Agreement

BY WALTER B. HARRIS, F.S.A., F.R.G.S.

[The United States is now threatening Morocco with the largest fleet which has ever assembled for such a purpose at a European port, and Rear Admiral Chadwick has recognized the dominant influence of France in Morocco by calling upon the French Government for aid in securing the release of an American citizen held for ransom by bandits. The following article explains the condition of affairs in that disturbed country and gives the terms of the recent treaty which will result in bringing this ancient Moorish kingdom under the control of a civilized power. The author of the article is the London *Times* correspondent in Morocco, and is a very well-known traveler, explorer and author.—EDITOR.]

ONE of the most important results of the agreement between England and France will be the opening up of Morocco. For centuries the Moors have managed to keep their country closed to all the world, and even to-day, with the exception of a few consular officials and a dozen or so missionaries, there are no European residents living in the interior. At Tangier, which is the diplomatic capital of the empire, the representatives of the foreign Powers reside, including a Consul-General for the United States of America. The result of this exclusiveness has been that the country has never progressed. It remains to-day in the same state of self-contented ignorance as existed a hundred years ago, and actually is far more backward than it was when, after their expulsion from Spain, the Moors returned to Morocco, bringing with them the remnants of their arts and learning. The great universities of Fez and Marakesh,

renowned even in the capitals of Europe as seats of learning, have become the merest echo of their former selves, and to-day are remarkable only as the hotbeds of intrigue and fanaticism, the centers from which the educated Moors —if such an expression can be used— disseminate their ideas and their sedition among the impressionable tribesmen.

The population of Morocco is bound together by no ties of patriotism, the whole system of the country being tribal, and it would take a great effort to call together the various tribes to wage war upon outsiders. A sudden fear that their policy of centuries—the policy of exclusiveness—was likely to be forcibly broken down by "infidel" Christians, and that their religion, a strict form of Mohammedanism, would accordingly be interfered with, might be sufficient to stir the population to a "Holy War," but even if such an improbability came about quarrels would speedily break out between the various tribes, and anarchy prove the result.

A natural and highly commendable desire to adjust the outstanding questions of England and France has not been the sole cause of the breaking up of an old empire which has successfully withstood the introduction of civilized methods for so long. There were also internal considerations, and these internal considerations threatened danger. The present Sultan of Morocco, Mulai Abdul Aziz, who came to the throne in 1894, is a young man of only some twenty-five years of age. He was always spoken of by his father as the member of his family who he desired should succeed him upon the throne, for the succession does not necessarily pass to the eldest son. In this case the Sultan has certainly one brother older than himself, if not more. Ascending the throne as a young boy, he passed immediately into the tutelage of a powerful Vizier, Si Ahmed ben Musa, who kept the youthful sovereign in the background and ruled the country in his name. Cruel, greedy of gain, and conservative as he was, it must be allowed that Si Ahmed held the country together in times of great difficulty. In 1901 he died, and the Sultan emerged from the palace—an unknown quantity—to take upon himself the reins of Government. It was soon apparent that he was a youth of considerable intelligence, but weak in his decisions. He at once showed pro-

A Typical Scene in Morocco—Moors and Their Tame Lion

clivities toward the inventions and discoveries of civilization. There were many men about him who recognized that an easy method of gaining his favor was by pondering to his tastes, altho these tastes threatened danger by incurring the adverse criticism of his fanatical subjects. Mulai Abdul Aziz filled his palace with every kind of European luxury and invention. Electric lighting and photography took his fancy, and he spent large sums of money on both. So keen was the competition among his entourage to remain in favor by supplying him with new toys that his commission agents invented a hundred methods of pleasing him, while at the same time filling their pockets. Cameras of gold, automobiles and motor cars —in a country where there are no roads —wild beasts, and every kind of extravagance were ordered from Europe and dispatched to the court. The fortune left by his father, the confiscated savings of the dead Vizier, the very revenues of the country, were spent on every kind of unsuitable and useless luxury. The fanaticism of the people was aroused, and in the autumn of 1902 rebellion broke out. An army was hurriedly called together, but the Sultan's entourage consisted of men of no capacity, whose one object was to continue making money. The rebellion increased, the horde of tribesmen which in Morocco is called an army was defeated, or, rather, fled at the sight of the rebels. The treasury was emptied and money was borrowed in England, France and Spain, and spent uselessly. The Sultan could only pay the interest on his foreign loans by raising further moneys. His checks drawn on the custom houses could not be paid, and still the rebellion continued. The state of affairs became a veritable anarchy, and the Morocco question loomed to the fore. It was at this precise time that the visit of King Edward to Paris and President Loubet's return visit to London had brought about the good relations which so happily exist nowadays between England and France. It was decided to include the question of Morocco in the list of matters to be dicussed. France possessed in Egypt certain rights which she so used as to cause constant difficulty to the Egyptian Government. It was decided to readjust these rights, without, of course, France abandoning them. In return England withdrew all opposition to the French Government taking in hand the reorganization of the finances, army and administration of Morocco, provided such rights as British subjects possessed in the country should be respected, and the form of Moorish Government,—in fact, the "status quo,"—should not be altered. By the "favored nations" clause of International Law these provisos extend to the subjects of all and every Power. The task that France has set herself is no easy one, for she has specifically agreed to restore order in Morocco. There is no doubt about her civilizing influence—she has given examples of it in other parts of the world, and she has had a vast experience in dealing with Arab Mohammedans, both in Algeria and Tunis—yet it is no easy matter to restore order in and reorganize a country which is in a state of anarchy, especially when the population, from the highest to the lowest, objects to being "reorganized," and is quite content to continue living in a state of anarchy. That the Sultan and his Government will acquiesce in the French proposals there can be little doubt, tho there is as little doubt that they look upon this intervention with no small feeling of dislike. But the fact that the court has granted its acquiescence to the scheme is only the very beginning of matters. The want of money, at present painfully felt at the capital, will be met by a loan from the Banque de Paris et Pays Bas, and this will tend to soothe the Viziers, whose salaries have not been paid for a long time. But the general population will have no share in this money, and therefore the loan will not soothe their feelings; on the contrary, the stipulation that the custom houses are given as guarantee will increase their distrust, both of their own Government and of the French.

That France will move very slowly is quite certain. There will be no immediate attempt to open up Morocco; on the contrary, the French Government will refuse to grant facilities for any enterprises which may render too apparent the hand of the "infidel" Christian. A commencement will be made with the finances. The Sultan's creditors,—many and clamoring,—will be paid. The foreign loans—a million sterling altogether

—will equally be settled, and France will remain, as her position entitles her, the sole creditor. Instructors will be sent to drill the troops, for in spite of the statistics in European almanacs and such like, the Moorish army does not exist. There are a large number of Maxim guns, and no one to fire them. Needless to say that these Maxims formed part of the goods brought to Fez by the Sultan's commission agents. One consignment of thirty-six arrived within the course of a very few months! Probably the chief instructors will be French officers, but there is no doubt that France will make use of her Algerian subjects, coreligionists of the Moors, and, therefore, less likely to excite ill feeling and jealousy. It is extremely doubtful whether any attempt will be made to reorganize the administration of the country for a long time to come. Bad as it is, it would be preferable to leave it bad for a period than to raise up another rebellion by undue haste.

Moors Visiting the Sultan

But these matters affect the French. What is more important to the subjects of other Powers is the question of trade and commerce. The writer has lived many years in Moroco, and can boast some knowledge of the country and its possibilities, and he has no hesitation in saying that he believes that French intervention in Morocco will mean a large increase of trade for all nations and all peoples. The manufacturers will send their goods with more confidence than has been the case in the past, and the absurd restriction on trade will be gradually removed. Harbor improvements and means of communication inland, both badly needed, will be brought about, and Moroco trade should go forward by leaps and bounds. The writer does not believe in the untold mineral wealth of the country, of which so much has been said and written, but at the same time Morocco cannot fail to be prosperous. Its agricultural possibilities are very large. Its climate is excellent, and its population are by no means averse to work. Given those items, the prosperity of the country can be assured.

Street Scene in Mekinez, Morocco

There is no need to speak of the betterment of the miserable condition of the people—that will come about by Morocco's contact with civilization. At present nothing could be more wretched than the manner of life passed by the inhabitants of a country where not only

is there no security for life and property, on account of the raiding propensities of the tribes, but where the people have also to fear the still more pressing evil of a corrupt and cruel officialdom. It will be France's duty to bring some little happiness into the lives of the Moors, and there is no doubt that she will accomplish her task.

There are two Powers in Europe to whom the terms of the Anglo-French agreement with regard to Morocco must be causing considerable annoyance. They are Germany and Spain. It has long been the desire of a large section of the German colonial party that when eventually the Morocco question came to the fore their Government should insist on claiming some portion of the country. They had even gone so far as to pick out the richest and best districts for themselves, and during the last few years the German press had repeatedly urged the point, while a German-Moroccan society was formed in the fatherland solely to keep the public and governmental attention fixed upon the question. But the agreement has dashed their hopes to the ground. There have been a few attempts to urge their Government to protest, but Germany's position at the present moment is not one that can allow her to risk a quarrel with both England and France.

As to Spain, her pretentions perhaps are better founded. She certainly has small territorial possessions in Northern Morocco—Ceuta, Melilla, etc.—but her incapability of governing her own country in a manner that gives satisfaction even to her own people did not tend to render the other Powers prepared to see her extend her territorial possessions in Morocco. The race hatred between Spaniard and Moor, existing throughout so many centuries, would alone render most difficult any attempt on her part to keep order in that country, nor are her methods of government such as commend themselves to the Governments or the subjects of other Powers. Spain is one of the richest countries in Europe, yet her resources remain almost untouched, largely from the supineness of her own people, who won't work them themselves and allow no one else to work them for her. Yet the Spaniards will be no losers by the French intervention. Morocco will be opened up to her laborers, and no doubt they will flock into the country as soon as public works commence, for the Spaniard is almost the only European who can perform manual labors in the climate of Morocco. In Western Algeria there is a large Spanish

The Palace at Fez

population, amounting, I believe, to 80,000, who live in a far better condition and are far more prosperous than under their own Government at home. Many Spaniards at Tangier, while regretting, for patriotic motives, that Spain has been excluded from territorial aggrandizement in Morocco, do not conceal their feelings that personally they prefer to be under the jurisdiction of the French.

France has, by the terms of the agreement, still to consult with the Spanish Government and to consider their interests, but it is extremely unlikely that any material benefit will accrue to King Alfonso's Government, or any material territory be added to his dominions.

There is but one detail more of the agreement to which reference must be made, and it is a most important one, for it guarantees the neutrality of the Straits of Gibraltar. The two signatory Powers, England and France, mutually agree not to allow any fortifications to be erected on the Morocco coast between Melilla in the Mediterranean and the mouth of the Sebu River, or the Atlantic —that is to say, a distance in either direction of over 120 miles from the Straits of Gibraltar. This solution of the difficult question of maintaing the "status quo" of the "Straits" seems highly satisfactory, and should quiet the fears of the Mediterranean Powers that France's intervention in Morocco might mean the closing of their exit to the ocean.

Briefly, the Anglo-French agreement regarding Morocco should bring peace and prosperity to that country and an increase of trade to all the nations that have dealings with it.

May, 1904, KASBA-EL-BAIDA, TANGIER, MOROCCO

My Sailor Lad

BY BETH BRADFORD GILCHRIST

O, the wind is in the lilacs and the drumming of the bees
Drones across the golden sunshine to my hammock 'neath the trees,
But my heart is with my laddie as he sails the clover seas,
  Where the wind-waves are splashing
  And the clover caps are dashing—
O, my heart is with my laddie on the seas.

From the port of the piazza rail I watched him sail away
To catch the crafty Spaniard where he lurks in Red-Top Bay,
And the locusts piped "To Quarters," as he steered to join the fray,
  With his curls tossing lightly,
  And his colors flaunting brightly—
As my laddie steered his stout ship toward the fray.

And my book? Ah, I'd forgotten. Let it lie. For what's to me
All this printed coil, this tangle now of two hearts, now of three,
When floating louder, floating fainter from the clover sea
  I hear the shouts of battle,
  Cannon's roar and musket's rattle—
Floating fainter from the clover blossom sea?

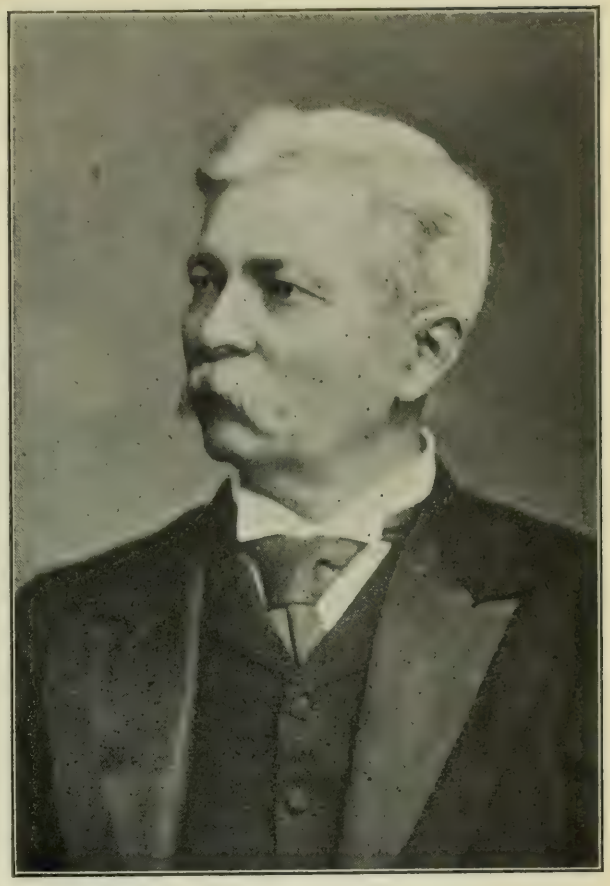
But I smile across the clover as I watch the slant sunbeams,
For I know that in my arms—and sooner even than it seems—
A tired little sailor lad will drop away to dreams;
  While the silver moon is sailing
  Among the star lamps trailing,
My drowsy laddie 'll board the Ship of Dreams.

RUTLAND, VT.

Politics and Pens in England

BY JUSTIN McCARTHY

THE growth of what is called Imperialism is receiving some startling illustrations just now. Parliament is in mid session and is preparing for its Witsuntide holidays, and the country has received what may almost be called the official announcement that the mission to Tibet is to become a conquering expedition. At least it is announced that the invading force sent out by England on what was at first described as merely a pacific delegation to prevail upon the ruling power of Tibet to listen to an offer of friendly intercourse from Great Britain is to push its way into the capital of the country and to dictate its terms there. Thus far the peaceful mission has marked its pacific way by successive slaughters of the miserably armed Tibetans, and now we are told that the British forces cannot stop there, but must press their way into that capital which has hitherto remained an unknown quarter to the missionaries of foreign civilization.



PERCY WHITE

Why European civilization, and especially that which England illustrates, should not leave the capital and the land of the Tibetans to the exclusive possession of their own people it would be difficult indeed for political sophistry to explain. If the Tibetans desire to keep their country all to themselves, that desire may, indeed, show them to be a narrow-minded and rather eccentric people, and we may pity them for their unreasonable exclusiveness, but it would seem to the ordinary mortal that we had better leave them to their own odd principles and not compel them by mere slaughter to accept at our hands what we are pleased to call civilization. However, it seems to be resolved by the Conservative Government—the word Conservative does not appear well suited to a policy which will not allow the Tibetans to conserve any of their traditional ways—that England must force her way into the Tibet capital over heaps of dead bodies and then dictate there the conditions which Tibet must accept. We all understand in England that this is not the device of Mr. Arthur Balfour and his colleagues here at home, but that he and they are drawn into it, or driven into it, by the pressure of Lord Curzon, Viceroy of India, and his councillors.

Of course, the only end of such a policy, unless some strange change of mood should come over our advocates of Imperialism, must be the compulsory surrender of Tibet to England's terms; or, in other words, to what may be practically described as the annexation of the hitherto unexplored country. Every attempt which the Tibetans may make against the British invasion will only cause the Imperialistic voice to be raised in louder and shriller cry for the complete subjugation of the land which has the audacity to resist our advance. We shall be told that the honor of England and the security of England's Eastern possessions demand the utter subjugation of the inhospitable race who refuse to welcome our incursions and who get themselves killed in masses rather than admit our right to do as we please with

what is not and never yet has been our own. The Imperialist spirit has become more and more inflammatory of late years, and it must be owned that at the present time its influence is not by any means confined merely to the political followers of the Conservative Government. Among those who sit on the side of the Opposition there are unfortunately some men of mark and of weight whose sympathies go very far with the tendencies and the movements of Imperialism. The true and genuine leaders of the Opposition are, indeed, still faithful to their own principles, but the Liberal Party is now sadly divided here and there and the spirit of conquest and subjugation has taken possession of many men who were once devoted followers of Mr. Gladstone. We have various little wars going on in Asia and in Africa, and we are called upon day after day to join in exultation over the conquest of this or that dominion or ruler concerning whose doings the English people have no more real interest than they might have in the condition of some unknown planet. When once a war of any kind breaks out it is the common human instinct to exult over the success of our own national forces, and thus it will I fear come to be with a large proportion of the English people when they hear of the further advance to the capital of Tibet. The Government, we may assume, will not be sorry to find public attention thus drawn away for the time from any inquiry into political mismanagement at home, and even Mr. Chamberlain's scheme of fiscal reform may fall into the shade while successive accounts are coming in of the resistance offered by the Tibetans and of its triumphant suppression by the guns and the bayonets of the peaceful mission from England.

The death of Sir Henry Morton Stanley has brought back into fame a name which of late seemed to be passing into forgetfulness, but which at one period had a renown scarcely inferior to that of any other. Stanley had for a long time been in weak health and had at the last General Election resigned his seat in the House of Commons, but his immediate death was not expected at the time when its announcement sent a thrill through the world. I can well remember the day when Stanley's successful expedition for

THE LATE SIR HENRY M. STANLEY

the finding and the rescue of Dr. Livingstone, the great African missionary, was the subject of rapturous admiration all over the civilized world. I had the good fortune to make the personal acquaintance of Stanley shortly after his return to London and I sat with him for a time in the House of Commons. He never seemed to me to be in any way puffed up by the success of his enterprise or by the immense popularity which it secured for him. He was a man of plain, unassuming manners, and altho he was made for a while the idol of society, he always retained his quiet ways and his somewhat rough style of converse. In the House of Commons he seldom spoke, but when he did speak he was always listened to with deep interest, because when he took part in a debate it was always on some question concerning which he had special knowledge and on which he spoke to the point and with the voice of recognized authority. But he never quite took to the House of Commons, and it might well be said of him, as it has been said of many another distinguished man, that tho actually in the House he was not quite of it. He married a gifted and beautiful young woman, Miss Dorothy

Tennant, as she then was, a lady of good family and of great artistic gifts. I had the honor of being one of the guests at the wedding festivity. I remember an anecdote told of this charming and gifted woman which I have good reason to believe is quite authentic. One day while she was still unmarried she sat at a dinner party next to a friend of her family, John Bright, the famous orator and Liberal leader. Bright, who was then an old man, and looking older even than his years, said to her in his sweet paternal way: "Do you know, Miss Tennant, that I have often wondered why you have not yet got married?" To which the girl gracefully replied: "The reason is that Mr. John Bright never did me the honor of asking me." Bright, who had been for a long time a widower, was much amused and pleased by the reply, which, considering the difference of their ages, had no hint of the "coming on" or of coquetry about it.

LORD CURZON

The publishing season is now well advanced and we have lately had some remarkable contributions to literature. I must notice to begin with a translation of that volume on "The English People" by Emile Boutmy, member of the French Institute, and author of many works which have to do with the ways and the constitutions of France, England and the United States. M. Boutmy's new volume, the translation of which has been published by Mr. T. Fisher Unwin, is enriched by an introduction from the pen of Mr. John Edward Courtenay Bodley, whose book on the Coronation of King Edward the Seventh I reviewed not long since in the pages of THE INDEPENDENT. I mean no disparagement whatever to M. Boutmy's study of the English people when I say that to most English speaking readers Mr. Bodley's introduction will at once commend itself and will absorb many a student for a time and check his eagerness to read the book itself. Mr. Bodley has devoted much of his life to a thorough acquaintanceship with France and its people, and his introduction to M. Boutmy's volume is one of the most masterly, exhaustive, and at the same time fascinating treatises ever written on the characteristic differences between the minds, the moods and the reasoning powers of Englishmen and Frenchmen. The student who goes carefully through this introduction and the work to which it leads is sure to feel in the end that without the introduction he could not thoroughly have appreciated the volume, and that having got the contents of the volume well into his mind he is drawn to go back with fuller appreciation to another perusal of the introduction.

A new and a thrilling sensation has just been provided for the novel reader by Mrs. Campbell Praed's latest story, called "Nyria." I have only just received the book and cannot make any attempt at an adequate review of it—a review which, however, I hope to give to my readers in my next contribution to THE INDEPENDENT. Just now, however, I shall confine my observations for the most part to the preface, in which Mrs. Campbell Praed tells to her readers the story of the birth and growth of this most remarkable novel. "Nyria" is a story of Rome in the days of Domitian, and Mrs. Praed's introductory pages, "To My

Readers," reveal the extraordinary fact that the authoress believes the whole story to have been told to her by one who in a state of previous existence "lived in the flesh nearly two thousand years ago." Such, Mrs. Praed tells us,

"is Nyria's extraordinary claim, borne out by historic corroboration of the events she described, by a multitude of confirmatory details which she gives, and by the evidence of her own life-like individuality as she revealed it to me during an intimate intercourse of many months."

Mrs. Praed declares that,

"startling as the statement may seem, it is no less true that the whole story of Nyria has been told me by—what shall I say? an entity? —a ghost?—a discarnate or reincarnate soul? —I know not how to call her—to whom is due a series of incidents and portraits which, when they touched history, I have carefully verified, and which I firmly believe my own imagination would have been incapable of originating."

Those who know Mrs. Campbell Praed personally, and she has a large circle of friends and acquaintances in the United States as well as in England, will know that she is no mere dreamer of dreams nor one easily apt to be taken by theories and phantasies about pre-existence and the passing of one life through various successive and different human forms. It may, therefore, be taken for granted that the manner in which the story of "Nyria" came to be impressed upon Mrs. Praed is itself a subject worthy of the deepest attention. I think I may safely venture to predict for this novel a vehement psychological as well as a warm artistic controversy.

One of the most attractive and brilliant novels published this season is "The Triumph of Mrs. St. George," by Percy White, whom American readers well know as the author of "Mr. Bailey-Martin," "The West End" and other stories of English life in various classes. "The Triumph of Mrs. St. George" is a bold and brilliant essay at a literary success in a field for which the author had not previously made much effort—a study of soul and feeling, of the influence of character on character, of the manner in which human destinies may be shaped and decided sometimes by human dreamings. The story is in itself intensely attractive and is, indeed, a very happy blending of romance and realism, of the psychical and the merely social. There is not a single character in the story which is not distinctly drawn and made to live and move, while the leading figures have certain qualities of originality which remove them quite above the level of the ordinary novel. The woman whose name gives a title to the book is a strange creature, in whose moral and mental being a continual struggle between good and evil is going on and is enabled to express itself in clear and life-like touches which make Mrs. St. George even in her strangest moods seem to us like some human being whom we have known and studied. The opening scenes of the story are laid on the sunny shores of Teneriffe and the surroundings are made as vivid and real to the reader as if he were gazing on some masterly work of the painter's art. The principal male character in the novel, Colonel Foulerton, is a sort of younger and more intellectual and cultivated Colonel Newcome, but there is never the slightest suggestion that the figure is drawn in any imitation of that created by Thackeray. The story is deeply melancholy, even altho the best man and the best woman—who is not Mrs. St. George—come to be married in the end. It is a book full of charm and must rank among the best of Mr. Percy White's novels.

London, England.

Literature

Books About Japan

If, to those of us who have loved and studied and believed in Japan for these twenty years or more, her present attitude before the world comes with a proud surprise, there is little wonder that to the public at large, who, with an easy contempt for Orientals and Asiatics, have regarded her as a negligible quantity in the world's future, there is a suddenness about her self-revelation that partakes of the nature of a miracle. To all who have tried to understand, and to all who have wondered without understanding, Mr. Watson's book* will be welcome. In this modest introduction the author writes:

"Hitherto the Japanese Unknowable seems to have given excuse chiefly for mirth. Because people have not understood they have laughed. Ignorance, indeed, commonly laughs, but knowledge of ignorance, consciousness of it, ought to regulate another mien. Is it not time for us of Western Europe to know our ignorance; to recognize the Unknowable, and wear against it a more continent face, if as yet we find it difficult to adopt about it a more serious mind? Is it not time in these pregnant opening weeks of 1904? I might urge this if nothing besides—that by taking Japan seriously we at least insure against Japan taking us by surprise."

The matter of the book shows Mr. Watson's effort to dive below the superficial charm of Japan,—a charm so great that to many foreigners there seems to be little else in the country worth knowing. Every survival of the old life of the nation, each step in its new development, is discussed in its bearing on the revolution. Religion, politics, home life, modern inventions, commerce, manufactures, the Constitution and its workings, the leaders of the present day, education, *Weltpolitik,* and the Anglo-Japanese alliance, have their place in the 320-odd pages of well-thought-out and epigrammatically expressed observations that make up the book.

For after all, they are only observations, they do not pretend to be more, but they are the work of a trained observer, sympathetic and conscientious, who recognizes his own limitations and when he cautiously advances a theory makes it quite clear to his reader that the suggestion is merely tentative. And if, to the reader anxious to arrive with speed at the pith of the discussion, the carefully balanced antitheses of the author seem wearying at times, it is well for him to remember that the contradictions of every-day life in Japan can often be best expressed by paradox. "It is Orientalism and the Middle Ages jostling the twentieth century and England; a medley, a revolution, a convulsion in being; the evolution of a man in a generation. It is inspiring; sometimes it is discouraging, disappointing, irritating. It is always interesting, or should be, for there has been no spectacle on earth like it since time began."

Of *Japan, the Place and the People** it is unnecessary to say a great deal. The introduction by Mr. Takahira, Japanese Minister to Washington, is worthy of a worthier book.

The character of his English does not always determine the trustworthiness of a guide in a foreign country, but we find in the text of Mr. Browne's book much to criticise besides his language. His history is usually hazy and frequently wrong. For instance, when he says: "The name of Yamato Damashii designated five provinces crossed by the Eastern Sea Road, sometimes known as Adzuma, and comprised what was popularly considered as the most important part of Old Japan," he is so entirely away from all the facts that it would be impossible to set him right. He seems to have confused *Yamato Dake,* who was a man and not a province, and conquered from the savages the provinces now sometimes known as Azuma, with "*Yamato Hamashii,*" the poetical term for the un-

* Japan, Aspects and Destinies. *By W. Petrie Watson.* New York: E. P. Dutton. $3.50 net.

* Japan, The Place and the People. *By G. Waldo Browne.* Boston: Dana Estes & Co. $2.50.

conquerable spirit of ancient and modern Japan.

The same uncertainty in regard to facts may be noticed in the titles of the very interesting pictures with which the book is profusely adorned. A messenger from a *soba-ya,* or vermicelli restaurant, is designated as a "lantern seller," and an extremely good, colored, full-page picture of a tattooed countryman carrying a letter in a forked stick is labeled "Japanese Postman," a distinct libel on the blue uniformed, responsible little men who attend to the distribution of the Imperial mail. The book, as a whole, is pretty and will be found to contain much interesting information, but must not be trusted as an authority, for there is hardly one of its 438 pages on which some error might not be pointed out.

*Japan, Described by Great Writers** is exactly what its name implies, an eclectic work in which, by extracts from different writers on various phases of Japanese life, a composite picture is presented. It is divided into six parts: The Country and the Race, History and Religion, Places and Monuments, Manners and Customs, Arts and Crafts, and Modern Japan. Among the writers quoted are Basil Hall Chamberlain, W. G. Aston, Isabella Bird Bishop, Pierre Loti, Sir Edwin Arnold and Lafcadio Hearn.

* JAPAN, DESCRIBED BY GREAT WRITERS. *Edited by Esther Singleton.* New York: Dodd, Mead & Co. $1.50 net.

SHINTO PRIEST.

From "Japan" (Dana Estes & Co.)

The illustrations, some from photographs, some from Japanese drawings, and one by Mortimer Mempes, are interesting. The value of the work might have been increased, had it occurred to the compiler to add the date of writing to each selection.

*Japan Today** has simply the value that the opinion of an honest, educated gentleman may have upon Japan as he sees it. The book makes no pretense to being exhaustive, and is, as its author says, "a kaleidoscope." It is evidently thrown somewhat hastily together to reap whatever harvest may come to its author and publishers from the present demand for books on Japan, and contributes nothing to the sum of our knowledge of things Japanese. It is, however, reliable in its facts, and may be read with confidence that no misinformation will be the result of the reading.

Doubtless every man who goes there has a right to publish his *Impressions of Japan,*† and most of them do, but such impressions are of no value to the stay-at-home unless he has some reason to think that the "impressions" are more than personal feelings and prejudices. Mr. Rittner gives a rosy picture of everything Japanese, and eulogizes even customs and institutions of which the Japanese themselves are much ashamed. What good can be said of a book which contains such statements as these:

"Girls of the best families in Japan go to [the Yoshiwara], and nothing is thought of it." "There is probably no country in the world where the morals of the people were higher than in Japan before the missionaries and European lay people went there, and now, after perhaps only twenty years of real civilization, the country has become spoilt." "The missionaries are men, as a rule, who, on account of their ignorance, are deemed unqualified to minister to the religious training of their own countrymen, and so are sent out to try what they can do with the heathens."

To those who know how the best men from the theological seminaries are picked and trained for foreign mission work, this is amusing.

The author, however, is kind enough to suggest that if the missionaries "leave out the word religion from their teaching" and do not meddle with the morals of the people "they might be more popular" and "they would find their work much easier." This is undoubtedly true.

The Expositor's Greek Testament,* Vol. III

THE growing light of modern times in the interpretation of New Testament writings is principally in the field of their historical setting. Philology and grammar have received important contributions, but the exhaustive study given to the minuter problems of text and translation during the nineteenth century left comparatively little in this department to be done. Hence attention is supremely directed, even in the case of a commentary such as "the new Alford," to the historical point of view of the commentator. What situation does he presuppose, as a result of his consideration of the historical problems connected with the origin of the writing, as the background of its drama? This question will rightly be the first to be asked by readers of the present volume.

Dean Bernard takes what may be called the traditional view of the circumstances of writer and readers of 2 Corinthians. The chronology of Turner and sequence of events of Lightfoot are adopted; 2 Cor. xiii, 1 refers to an unrecorded visit actually made; the "painful letter" of 2 Cor. ii, 4, vii, 8, 12, is our 1 Corinthians; the offender of 2 Cor. ii, 6-11 is the incestuous man of 1 Cor. v, 1-5. The entire integrity of the epistle is maintained against the critical identifications of 2 Cor. vi, 14—vii, 1 and x, 1—xiii, 10, with fragments of the "lost letter" of 1 Cor. v, 9, and the "painful letter" respectively.

Rendall adopts the South Galatian Theory, for which the determined and able advocacy of Ramsay has recently secured an authority in England almost as undisputed as that formerly enjoyed through the authority of Lightfoot by

* THE EXPOSITOR'S GREEK TESTAMENT. *Edited by Rev. W. Robertson Nicoll, M.A., LL.D. Vol. III, including 2 Corinthians, by J H Bernard, D.D.; Galatians, by Fred. Rendall, M.A.; Ephesians, by S. D. F. Salmond, D.D.; Philippians, by H. A. A. Kennedy, D.Sc.; Colossians, by A. S. Peake, M.A.* New York: Dodd, Mead & Co. 1903.

the North Galatian. In Germany opinion had long been divided when Ramsay's new arguments were presented, and still continues so, in spite of Zahn. Rendall presents the case from a broad and very effective standpoint. The same study of Acts which qualifies our commentator for his sound judgment on these rival theories guards him from the violent assumptions of Ramsay in the attempt to harmonize Galatians with Acts, altho harmonization is here also carried to an extreme. Acts xv and Gal. ii, 1-10 are admitted to refer to the same occasion; but the exclusion of the visit of Acts xi, 30, and of the decrees of Acts xv, 20, 29, in Gal. i,, 18—ii, 1, and ii, 6-10, respectively, is explained away, with great injustice to Paul. The epistle is dated, with Zahn, from Corinth before the arrival of Timothy from Macedonia, Acts xviii, 5; Paul's conversion in 37, his arrival in Rome in 60-61, the Apostolic Council in 50-51.

Salmond pronounces in favor of Rome, A. D. 62 or 63, as the date of Ephesians, and repeats with some enlargement the arguments very fully stated by T. K. Abbott (*Internat. Crit. Com.*) against the reading ἐν Ἐφέσῳ As the almost universal opinion of scholars who admit the genuineness of the epistle is thus adopted, and no reason remains for specially connecting it with Ephesus (it is shown, in fact, that the implied relations are "of a different kind from those which we know to have existed between Paul and the Ephesians") it does not seem quite relevant that the Introduction should open with two long sections on "(1) Ephesus" and "(2) The Church in Ephesus." The comment is of the same minute and careful philological type as that of Abbott.

Kennedy rightly questions the value of Lightfoot's argument from resemblances of style, on which Salmond relies for dating Eph.-Col. after Philippians, and regards Zahn's arguments as "quite conclusive for placing *Phil.* after *Eph., Col.* and *Philem.*" He adopts Turner's chronology, dating Paul's arrival in Rome "early in 59." Doubts on the unity of the epistle seem to him to have no adequate foundation. The crucial passage ii, 6-11 is interpreted with a sensible avoidance of metaphysics; but the reference of the ἁρπασμός (= *res rapienda*) to that "equality with God" which Jesus was prompted in the Temptation (?) to seek by wonder-working, seems to us far less probable than the older view, to which reference is made only in brackets (by the editor?), that the reference is to the first Adam who sought to be "like God" (Gen. iii, 5) by "robbery."

The admirable Section II in Peake's introduction to his exposition of Colossians, surveying contemporary Jewish "Angelology" as a preliminary to the study of the false teaching opposed in the epistle, shows more of the breadth of modern method than anything else in the volume, and affords relief from the sense of cramped confinement to minutiæ, that a preponderantly grammatico-philological treatment inevitably produces. Professor Peake's definition of "Gnosticism" would probably exclude the type represented by Cerinthus, or he would scarcely deny (p. 485) its existence "even in a rudimentary form" in both Colossæ and Corinth. It were desirable to have some understanding on terminology between the school he represents and that of Friedländer. Professor Peake's is also the most satisfactory handling of critical questions.

In general the volume may be said to more than maintain the standard of its predecessors in exegetical scholarship.

American Literature

THE fact is that American literature is not an organic whole. Its products do not spring one from another in a continuous growth or development, whose connection, as in other literatures, are easily traceable. On the contrary, they form a sort of broken chain or series, no two terms of which are necessarily consecutive. Their explanation, therefore, is to be sought elsewhere than in their predecessors; with a few exceptions their real ancestry is English. For this reason those histories of American literature which undertake to include every book printed in America under the impression that they are in this way preserving the continuity of American letters are following a false scent. If they wish to trace the origin of such and such a tendency they should, as a rule, turn to the corresponding period of English litera-

ture. In this way and in this way alone is it possible to discover a rational order and evolution in American letters.

The first book that we know of to enunciate this truth plainly and unreservedly is Messrs. Higginson and Boynton's *History of American Literature.** But the volume, tho it begins with so just a perception of the principle in accordance with which this sort of work ought to be written, does but little to follow it out beyond recognizing "the close relationship which has always existed between American writing and English writing." And yet this is something, and it would probably be unjust to ask more of a book of this particular character. It consists of a course of lectures delivered before the Lowell Institute by Mr. Higginson and revised for publication by Mr. Boynton, who has also added "apparatus necessary for its use as a text-book." For what it pretends to be, therefore, a popular or "reader's history," it answers its purpose better no doubt than if it had undertaken seriously the derivation of American literature in accordance with its own theory.

It is a clear, consecutive account of the most important literary work produced in America, with some reference to determining conditions of thought and circumstance. It is not particularly original, it must be confessed, nor always critically sound. Indeed, its chief blemish is a kind of narrow literary parochialism due to a lack of sane and catholic criticism.

"The not altogether admirable distinction, therefore, belongs to Sandys of having laid the foundation for the form of heroic couplet which became a blight upon English poetry in the eighteenth century."

Why should so much of our work in America be disfigured by blots like this? It would be impossible for a Frenchman to write in such fashion of one of the great periods of his literature, one of the prominent forms of his poetry. Even if he did not know better of himself, the fear of an enlightened public literary opinion would restrain him.

But with these exceptions the book, on the whole, is fair. It contains a number of illustrative quotations, particularly from the earlier writers, which display a rather unusual first hand knowledge of the documents, and it is grateful to note as an offset to our previous stricture that it renders something more than the usual scant justice to Brockden Brown, and appreciates at its proper value the superiority of Parkman as a historian over Fiske.

* A READER'S HISTORY OF AMERICAN LITERATURE. *By T. W. Higginson and H. W. Boynton.* Boston: Houghton, Mifflin & Co.

The Descent of Man. By Edith Wharton. New York: Charles Scribner's Sons. $1.50.

There is, of course, such a thing as a purely artificial existence. And the illusion is so perfect that many people are born into it and die out of it without discovering that they have never really lived at all. This class may be illustrated by two singular extremes, the unfortunate rich and fashionable, whose sensibilities are more refined than their virtues or vices, and whose cares and woes are too splendid to deserve the sympathy of those who have real sorrows; the other is certain student types, whose thinking has lead them away from realities into a region where right and wrong are so thinly shaded that one could never feel very good or very bad whatever his conduct might be. For all such types and conditions Edith Wharton is the best interpreter among American writers of fiction. The initial story in this new volume of short stories proves her genius along this line. The hero is a scientist. He despises the knavery of attempting to popularize knowledge by presenting it in sentimental forms, and to show his contempt he writes a pseudo scientific work, which he expected to be taken as a burlesque upon the popular manner. But it is received more seriously and graciously by the public than anything he has ever done in earnest. He is amazed, mortified, but the money he gets from the fake is a bait which his hair spun integrity cannot resist. He writes more books of the same kind because it pays. His "descent" consists in this small caper. But as he does not recognize any God, and his original morality consisted merely in a scholarly devotion to a standard of professional ethics, his descent is vulgar rather than tragic. The *Quicksand* is another geometrically accurate demonstration of the same idea from a different point of view. And the

reader receives the impression that Mrs. Wharton has made a literary art of casuistry. Her characters have conscientious scruples that rarely deal with the real issues of life. And none of them have the will power to live up to their lights. Moral defeat is the sum total of every situation portrayed in this book. And no one except perhaps Mr. Henry James can present a revolting scene with more social delicacy. In the story *The Other Two* the heroine has three husbands, all so closely connected in business or otherwise that upon a certain occasion she serves tea to them around her own parlor fire. The very ease with which the incident passes is offensive; and the woman's tact suggests that she is like an old shoe, worn by so many that she has become disgustingly adjustable to all. But from first to last the elegance and delicacy of the language employed conceal the leprous truth as effectively as some decorative conversations will the license meant by the speakers. And nowhere, either in her ideas of virtue or vice, does she come into contact with normal life.

The Wood Carver of 'Lympus. By Mary E. Waller. New York: Little, Brown & Co. $1.50.

A few books are published every year that really minister to the tired hearts of this hurried age. They are like little pilgrimages away from the world across the Delectable Mountains of Good. They rest us and fill us with the ancient peace that yet belongs to these altitudes. Last year it was Irving Bachellor's, "The Blessed Isles," this year it is *The Wood Carver of 'Lympus.* This young man has been crippled for life by a falling tree in the forest and lives in a small cottage with his kinsman on one of the tallest peaks among the Green Mountains of Vermont. Circumstances may make a martyr of any man, but the man alone makes a hero of himself. And after the inevitable season of rage and rebellion the superb power of resurrection this man shows in taking up the burden of life under such difficulties is an inspiration. His thoughts are so kin to all we know of courage and fortitude we cannot think of him as a fictitious character. The story of his life shows him so close to the earth, so near heaven, and it is so woven in with all the sights and sounds of world about him, that we feel the pain and breath of life in it. With the patience of one who has nothing but time before him, he carves into the hard wood beauty, life and love, every hope he has not is fulfilled there, and the joy of his work carries him triumphant over the destiny that laid him low. And it is all told with a primitive sweetness that is refreshing in these days when every writer cultivates the clever style.

Letters from England. By Elizabeth Davis Bancroft (Mrs. George Bancroft). New York: Charles Scribner's Sons. $1.50.

London, where so many noted men and women have foregathered, first and last, was never more interesting socially than in the period—from 1846 to 1849—when Mr. Bancroft held the position of American Minister to England. Macauley, Carlyle, Mrs. Somerville, the poet Rogers, Sir Robert Peel, Lord Wellington—these are a few of the names which sprinkle the pages of these letters. Of course, Mr. Bancroft's fame as a writer secured for him and for his wife entrance into literary and artistic circles where his official rank, high as it was, would scarcely have carried them, and evidently they made full use of their opportunities. "We are the greatest diners-out in England," Mrs. Bancroft remarks, with what most of her readers will believe to be absolute truth. Her letters—gleaned for the most part from her correspondence with her sons—are not brilliant, but they are very readable. The instincts of the American housewife often appear. "I cannot get used to the London dinge," she writes; and her experiences with the awe-inspiring English servants are amusing. "I am obliged to confess that I have a very nice household, but that I am the only refractory member in it. I am always asking the wrong person for coals, etc., etc.," she complains. Women of the diplomatic circles of to-day, with their numerous toilettes, would be entertained by the air with which she announces the addition of "two new dresses" to her wardrobe. "I do not like dining with bare arms and neck," she adds, "but I must." But there was another side to Mrs. Bancroft's character.

Sympathetic and broad-minded, she was capable of appreciating to the full the society into which she was thrown. A varied society it was. A breakfast with Tom Moore, "a wreck, but a most interesting one"; a day with Lady Byron; dinner with the Queen; the opening of Parliament; a trip to the Lake Country with Miss Martineau as guide—these are a few of the events which made the everyday life of Mr. and Mrs. Bancroft in England. Some of her comments upon English character are worth noting. Perhaps nothing is more typical of the English conservatism than an anecdote she relates of a certain Lady Suffield, who was

"so opposed to innovations of all sorts that, tho her letters, which used to arrive at two, before the opening of the new railroad, now arrive at seven in the morning, they are never allowed to be brought in till the old hour."

The Daughter of a Magnate. By Frank H. Spearman. New York: Charles Scribner's Sons. $1.50.

As the author of "Doctor Byson," one of the cleverest novels that appeared last year, Mr. Spearman is already known to many readers, and this new story will confirm his reputation in the literary world. The love affair in it is more conventional, possibly less interesting, than Doctor Byson's, but as a work of art the book far surpasses that realistic interpretation of life in Chicago flats. It is founded upon the adventures, the hardship and genius of a young civil engineer on the mountain division of a great Western railway, and not even Hamlin Garland surpasses Mr. Spearman's descriptions of the natural scenery. Indeed, there is dramatic power in the significance he gives to the "spider water," to the floods and snows that threaten the world from above in those regions. As a rule, there is an element of vulgarity in the realism of a railroad story, but here we have poetic reality that is not defaced by the slim steel tangents that are cut across it out of the mountain's grizzled cheek, or spun in an iron web above the treacherous "spider water." And now, when so much fiction is based upon the cheap fallacies of the author's ignorant imagination, another quality of Mr. Spearman's work should not be overlooked. The care he took to make the character of Doctor Byson, the oculist, real in the scientific sense will be remembered, and in the development of this story he shows a practical knowledge of the difficulties of mountain engineering that adds the charm of veracity to the situation.

The Darrow Enigma. By Melvin L. Severy. New York: Dodd, Mead & Co. $1.50.

If any one is curious to know how a man sitting in a chair, surrounded by his friends, eight feet away from a window opened six and three-quarter inches, can be murdered by a slight wound in the back of the neck, without any one perceiving the murderer, he can have his curiosity satisfied by this book, altho he will have to follow out as many promising but false trails as there are amateur detectives, and get a convinced prejudice against every innocent person in the book in turn before he arrives at the solution of the mystery.

The Panchronicon. By Harold Steele Mackaye. New York: Charles Scribner's Sons. $1.50.

The origin of the Bacon-Shakespeare theory is here explained by the transportation to the age of Elizabeth of some New England people by means of a flying machine from the future. All the factors of this novel have been better done before: the conduct of conventional women in strange circumstances by Stockton, the Yankee at an early English court by Mark Twain, the time-machine by H. G. Wells; but that does not prevent this new combination from affording amusement.

The Gates of Canceh. By van Tassel Sutphen. New York: Harper & Bros. $1.50.

Arabian Nights tales in modern New York, wherein the reader will find it literally true that it is the unexpected which always happens. Each adventure is chained to the next with no chance to stop in between. One does not finish "The Story of the House in the Middle of the Block" before he is involved in the mysteries of "The Private Letter-Box," and thence is insensibly led to peruse "The Story of the Ninety-and-Nine Kisses."

Literary Notes

MANZI, JOYANT & Co. (New York) publish a History of Louisiana, by Alcée Fortier, in three sumptuous limited editions at $60, $200 and $300 for the set of four volumes.

...."Steps Christward," by Howard Allen Bridgman, the Pilgrim Press, Boston, is the result of ten years of suggestion to Christian Endeavor societies through *The Congregationalist.*

....Mrs. Stevenson has compiled a book of "Prayers," written at Vailima, by Robert Louis Stevenson, and used by him in conducting family worship. It is published by Charles Scribner's Sons at 50 cents.

....Not long ago everybody was reading "Acres of Diamonds," by Russell H. Conwell. His latest book is entitled "The New Day," and is addressed to young men. It is published by the Griffeth & Rowland Press, Philadelphia.

....A volume of "Silhouettes," by Father Occidentalis, is brought out by the Argus Press, in attractive limp leather binding and clear type. It is a series of sketches, illustrating, in the words of the author, "The Failure of Jesus and His Triumph."

....A new volume, by the author of "Twelve Letters to My Son," printed by the Nunc Licet Press, Philadelphia, 75 cents, contains an "interpretation of prayer, a collection of the great prayers of Scripture and remarks on the nature of prayer by eminent men."

....Mrs. Jane Dearborn Mills has recently published a book on child training, under the sublimated title, *The Mother Artist.* Its hints are practical, and will be helpful to the inexperienced mother who consults it for guidance (The Palmer Company, $1.00).

....The first volumes in the American Crisis Biographies, of which there will be about twenty-five, giving a full and impartial history of the Civil War and the causes leading up to it, will appear in the autumn. The editor, Dr. Ellis P. Oberholtzer, has secured the co-operation of a number of competent writers for this important historical work. Brooks Adams will write the life of John Quincy Adams, his grandfather. Gaillard Hunt is writing the John C. Calhoun; Prof. C. H. Van Tyne, who lately edited a volume of Webster letters, the Daniel Webster; Joseph M. Rogers, the Thomas H. Benton; Booker T. Washington, the Frederick Douglass, and W. E. Burghardt Dubois, the John Brown. Jefferson Davis is being studied from a Southern point of view by Prof. W. E. Dodd, of Randolph-Macon College, and Robert E. Lee will receive the same treatment at the hands of Prof. Guy Carleton Lee, of Johns Hopkins University.

Pebbles

A YOUNG preacher was recently called upon to officiate at a funeral in the absence of the pastor of the church. He knew it was customary for the minister to announce after the sermon that those who wished should step up to view the remains, but he thought this was too hackneyed a phrase and said instead: "The congregation will now please pass around the bier."—*The Monist.*

....A professor of the University of Illinois, after a certain football victory, entertained one night a group of students at his residence. A magnificent sword hung over the fireplace of the library, and during a space of silence the professor took down this sword impressively. "Never will I forget," he exclaimed, "the day I drew this blade for the first time." "Where did you draw it, sir?" a freshman asked respectfully. "At a raffle," said the professor.—*New York Tribune.*

....There is nothing like a husband's love; it endures forever. W. A. Fiske, of Kalamazoo, Mich., returned home after an absence of nine years. He hadn't seen his wife for nine years, or written to her, but loved her just the same. Looking through the window he saw her in the arms of a man. He rushed in and beat the man almost to death before he recognized that the man was his son, who had grown up since he went away. This, girls, is love. Neglect for nine years, and a fierce jealousy when some one else usurps the lover's place.—*Atchison Globe.*

....Lacking the time to read a story through, we have fallen into the habit of reading the closing thrills, and making the rest up. Here are a few endings of books that the women are raving about: "And he took her into his arms, smothering her with kisses." . . . "A kiss stopped further protests." . . . "She gave a quick glance upward, her eyes fell, but the glimpse he caught of her eyes satisfied him, and he grasped her to his heart." . . . "He had turned away, and was walking down the path with his head bent, when a light step behind him caused him to turn quickly. In another minute she was in his arms, and his heart was glad." . . . "They gave one farewell look at the familiar scenes, and when they turned to leave, her hand was in his, and it was this way that they left the home of their fathers forever." . . . "Oh, Margaret, Margaret," he mumued, "it could not have been otherwise, could it?" After reading the endings, we have decided that it would have been a great waste of time to read the book. Since our great desire is for the ultimate happiness of all, why wade through trials and blood to find how they attained it?—*Atchison Globe.*

Editorials

International Peace

With the noisiest drum-roll and cannon-roar of Eastern war mingle the soft flutings of peace from the hills that environ Lake Mohonk. Once more the annual concourse of philanthropists has met there and heard the more renowned victories of peace acclaimed and the horrors and waste of war denounced, and once more have they urged on statesmen and people the gospel of good-will to men.

This is a lesson of which we must not grow weary. It must be preached with unflagging reiteration until men shall learn that there are other ways than fighting by which international differences can be settled. The Mohonk Conference has most to say of arbitration, because that is the likeliest alternative for war. The platform adopted urges that treaties be made with those countries which have intimated their willingness to submit any differences with our Government to The Hague Tribunal, and that steps be taken to have such treaties negotiated with all countries.

What is wanted is no partial treaties which shall except any matter of dispute whatever. "National honor" is a very elastic term, and there are and can be no questions of national honor which we cannot safely submit to an impartial court. We have lately proved this by a happy decision of our dispute with Great Britain over the Alaskan Boundary. In this case we left the decision to the arbitration of six men, three from the United States and three from Great Britain, and they were able to come to an amicable and honest conclusion. If they had been unable to agree the dispute might have with equal propriety gone to The Hague for decision.

Especially is it important that the arbitration treaties signed by representatives of all the nations of the Western Hemisphere at the international American Conference held in Mexico in 1901 and 1902 should be speedily ratified. This is the duty of the United States Senate, a body which has been none too favorable to arbitration treaties, any more than it has to reciprocity treaties. It is a shame that it should be left to Chile and Argentina and France to set examples to the United States in social and Christian duty.

There will be held this coming autumn in St. Louis, in connection with the Exposition, a Congress of International Arbitration, with representatives officially appointed by various countries. The American group in that Congress will have no reason to be ashamed of what their countrymen have done to create The Hague Tribunal. But for the American representatives there would have been no such tribunal created, and the Conference would have been little more than a fiasco. But our American group at the St. Louis Congress will have little reason to boast of the part taken by our Government in its rejection of an arbitration treaty with England, and in its neglect of action on the treaties with the American states. While a majority of the Senate will not favor such treaties, the necessary two-thirds vote is not easy to secure.

But President Roosevelt is right on this subject, as usual, and will do what he can for the cause. If the Congress at St. Louis shall take action urging another Hague Conference with a view to further formulating the rules of war, and especially for negotiating treaties of arbitration, we may be sure he will be happy, if desired, to initiate the project by calling the Conference.

We would have our readers understand how all this would tend toward the inevitable final result, the union of all nations in one grand international congress of the world. It is already prophesied in many ways. The Hague Conference was the first session, and the new Conference to be called will be a second session. In time it may meet at regular intervals, and then its scope of duty will enlarge until it shall assure the peace of the world, and the horrid torch of war shall flame no more, and Bellona herself shall sink into eternal sleep, with sullen Moloch and all the grisly kings and burn-

ing idols of belated paganism that have too long survived the advent of the Prince of Peace.

An "Artistic Swindle" Forgotten

This is a busy world. In that part of it which is called New York, public prosecutors and other officers whose duty it is to enforce the laws find much to engage their attention and consume their time. Some offenders can be punished with little delay; for others, the machinery of justice, once put in motion, grinds slowly; there are others still for whom the starting of that machinery is so long deferred that they seem to have been forgotten.

There was once a "get-rich-quick syndicate" conducted by one Miller and a shrewd associate named Ammon. It had been duly incorporated in New Jersey. That was not very long ago. Justice pursued these men, and they were placed in Sing Sing prison. Only a few weeks have passed since the curious methods of the Globe Security Company were brought to public notice, but even now David Rothschild has begun his term of nine years in the same prison. All persons accused by public officers of violating the laws by disobeying the statutes relating to financial corporations and by misleading investors are entitled to trial by jury. The charges may then be disproved. These men were tried, as many others have been. The State Superintendent of Banks declared in his official report that the officers of a Trust Company in New York had "flagrantly transgressed the laws" in connection with the promotion of the United States Shipbuilding Company, commonly known as the Shipyard Trust, but no one of these officers has been brought into court to defend himself against this accusation.

This reminds us that the interesting record of this Shipyard Trust appears to have been forgotten in certain places where, we should say, it would have been easy to remember it, altho the pursuit of gamblers and other small-fry of the get-rich-quick brotherhood is a very engrossing occupation.

Five months ago there was much talk in New York and elsewhere about the Bank Superintendent's assertions and those other and numerous charges made in an official report to the court in New Jersey by Receiver Smith, formerly a Senator of the United States, who characterized the whole Shipyard Trust project as an "artistic swindle." We recall that he also spoke of misleading and false statements, resembling those for which Whitaker Wright was prosecuted in London, of false prospectuses, of false official reports concerning earnings and assets and working capital, of dummy Directors, of the incorporation of the company by the very clerks who had performed a similar service for get-rich-quick Miller and Ammon, and of other objectionable acts in the brief career of this corporation, that was capitalized at $68,000,000. We remember also that the Governor of the State was to ask for a legislative inquiry, and that there was talk of a special grand jury.

As we have remarked, this is a busy world. New interests arise to displace old ones; new duties dim a public officer's recollection of old ones that were neglected. Even an alert District Attorney cannot avoid overlooking or forgetting something. Month after month has passed, and the men accused by the Bank Superintendent and Receiver Smith have not been required to seek vindication in court. But we have not heard that they complain.

Certainty of God

"Blank and blatant Materialism is dead"—so declared Dr. William D. Mackenzie, the new President of Hartford Theological Seminary, in his brilliant inaugural address the other day. We wish we might believe the assertion, but we fail to see the evidence of its truth.

What is Materialism? It is a philosophy which declares that, so far as we can see, all life, with all its manifestations and powers, has grown out of what, so far as we can know, is original inorganic matter. It teaches that somehow, by a process of evolution, the cell has been produced, through inherent forces, out of atomic movements and attractions, and that the cell has grown through successive steps, each self-evolved, to the thinking, reasoning man. Materialism does

not positively assert there is no Great Unknown beyond Nature, but it knows none and needs none. Such Materialism is as "blank" as the blankest, whether it be "blantant" or not. In a phase of it it may be called Agnosticism, but it is blank Materialism all the same; for it finds in the forces of matter all the force needed for explaining all mental and moral activities.

If one doubts whether this "blank" Materialism still is in evidence, let him read Mr. Mallock's "The Veil of the Temple," lately published. In that book the principal speaker leads the discussion of the prime question of religion, and step by step finds that science has uprooted all our mistaken proofs of God as creator or ruler of the world. Even dead matter has life as truly as the plant or the animal, he tells us; for is there not a constant and rapid movement within the very atoms themselves, and do we not see them breaking up into new forms, under internal forces, before our eyes? And this he represents is the prevailing belief among intelligent, thinking men.

But President Mackenzie will have none of this. He escapes it by the energy of positive, emphatic assertion. What he claims to give us is "immutable conviction about absolute truth;" and he gets it by none of the old and familiar arguments, which he does not even stop to brush aside, but by the assertion that consciousness, whether of the race or of the individual, directly gives us this "immutable conviction of absolute truth," this "absolute truth" being God. He begins his argument by asserting that "the first and deepest fact on which we can plant ourselves is the reality of man's spiritual nature," which seems to suggest that he is about to overthrow Materialism by substituting the antagonistic monism of Idealism. But Idealism, which knows only its own mental states, is separated by quite as wide a gulf from an external God as is Materialism. But Dr. Mackenzie escapes this by more consciousness:

"The self-consciousness of the human being is the root of all his life. That awakens at his birth. It persists through all his years."

Is it so sure that it is "the root of all his life"? Did not his life begin before his birth, and before self-consciousness? President Mackenzie continues:

"It [self-consciousness] has the strange power of connecting itself directly and consciously with the absolute, in knowledge and in purpose, in those godlike judgments which we call conscience, in that affirmation of immortality which we call love."

If we get any meaning out of this language it is that conscience is a consciousness of God, the Absolute, and that love is both a consciousness of God and also an affirmation of immortality. Statements which the ordinary mind does not recognize as true. But he proceeds to tell us that man "has ever lived in the consciousness of relation to God"; that religion has ever "lived upon this consciousness of a mutual action between that self-consciousness which is above man and that which is himself," and that here he "comes into the possession of an ultimate conviction regarding an absolute truth"—that is, God.

As to this basis of ultimate conviction of absolute truth we would ask a few questions. First, Is there not danger that the word "consciousness" has too much put upon it in this modern transcendental apologetics? Do they not call that consciousness which we have been in the habit of calling belief? Do they really have a consciousness of God, or only a belief in him? Do they know the difference between belief and consciousness? Have they really felt something not themselves touch them which they knew must be the finger of God?

If so, happy are they. But can they offer their evidence to ordinary people who never have had and never can have this mystic experience, and can they expect common folks, born prosaic, rationalizing occidentals, trained scientifically, to accept their testimony as conclusive? Do they not see that to tell us that there must be a God (why must they misname him "the Absolute"?), because humanity has ever had a consciousness of God, and because conscience and love are a consciousness of God, is, to the ordinary mind, utterly senseless, and seems like a confession of logical impotency? What would Huxley or Spencer say to that? Nothing, because they could not understand it; they have themselves had no such conscious-

ness of "the Absolute," and they would continue the study of the evolution of the moral sentiments. They would say that, reduced to plain words, the argument is, We believe, because we believe.

The trouble with Professor Mackenzie's argument, so far as it is not based on a confusion between consciousness and belief, is that altho it may be interesting to those happy people who experience this consciousness of the Absolute, it adds nothing to them, while it carries no bit of conviction to those who need conviction, and who do not possess the faculty of God-consciousness. We much fear for the argument that it will damage the cause of Theism, and will create more skepticism than faith.

A New Record of King Jeroboam

The first inscribed material found in Palestine excavations was a clay tablet discovered by Dr. Bliss at Tel-el-Hesy, the ancient Lachish, part of a correspondence between the Egyptian over-lord and the subordinate princes and governors of Palestinian cities toward the close of Egyptian supremacy, about 1400 B. C. This tablet belonged to the pre-Israelitic period, and was written in Babylonian cuneiform. For a long time no other similar material was discovered. In 1902 an Austrian expedition undertook the exploration of the site of ancient Taanach, now Tel Ta'anuk, on the southern edge of the plain of Esdraelon. Here, in the following year, were discovered three clay tablets and one stone tablet in cuneiform script of approximately the same period.

Some four miles to the westward of the mound of Taanach lies a small mound, called Tel Mutesellim, evidently the ruin of an ancient site. This has been generally identified with the ancient Megiddo, an important Canaanite city in the pre-Israelite period. Megiddo is known from Egyptian inscriptions, from 1600 B. C. onward. According to the biblical narrative, it was fortified and, presumably, provided with a Hebrew governor in the time of Solomon, but plays no part in Hebrew history, seemingly passing out of existence with the Exilic period. In the apocalyptic literature the name reappears as Armageddon.

The German Palestine Society commenced explorations at Mutesellim April 1st, 1903. A trial trench showed that there were some sixty-six feet of *débris*, representing at least six well worked strata of occupation, the topmost of which was itself ancient, so that the explorers reported Canaanite and pre-Israelite remains at a depth of less than six feet. *Mazzeboth*, the "pillars" of the English Bible, which were used by heathen and Hebrew alike in connection with places of worship, some of them with marks strikingly resembling early Phenician characters, human burial places, with bronze implements, early Egyptian scarabs and one Babylonian scarab, were among the results first reported.

In March of this year the explorers discovered a jasper seal of so remarkable a character that we reproduce the

Seal of King Jeroboam's Officer

photograph herewith. About the lion in the center is the inscription *lsm'*, and beneath it *'bdyr'b'm*. Every letter is clearly cut, and the sense unmistakable: "Belonging to Shema', servant of Jeroboam." Epigraphically considered, the letters of the inscription find their nearest analogies in the Moabite inscription of King Mesha, the Siloam inscription from Jerusalem and the Hebrew inscriptions on the handles of jars found by Dr. Bliss at various places in Judaea. As between the characters of the Moabite and Siloam inscriptions, the resemblances are a little closer to the Siloam than to the Moabite. The letters differ materially from those found in the Sidonian inscriptions of the fifth and fourth

centuries B. C. The inscription, therefore, belongs to an early period, but with our present knowledge it is impossible, from the letters only, to determine to which Jeroboam reference is made. The historical conditions, as we at present know them, would admit of the reference either to Jeroboam I, in the tenth century B. C., or to Jeroboam II, in the eighth century B. C. If the former be intended, this would be the oldest dated inscription in Phenician characters yet discovered. From the title used it is clear that Shema' was an official in some way representing Jeroboam, presumably at Megiddo. The term "servant" is constantly used in Hebrew to indicate such a relationship, and so we find Jeroboam I himself designated in the Book of Kings as the "servant of Solomon." The name Shema' occurs in Hebrew, altho more commonly we have the name with the divine suffix added, Shemaiah. It was a prophet of this latter name who, according to the Greek translation of Kings, incited Jeroboam to rebellion against Solomon. The name Shema' would be an equally good Canaanite name, and might represent the Canaanite prince who, under the suzerainty of Jeroboam, governed the town of Megiddo. The lion symbol we ordinarily think of in connection with Judah, but the prophets symbolize Israel as a whole by the lion, so that the symbol would seem to befit the signet of an officer of the King of Israel.

In itself considered, it may be said that the inscription is of no very great importance. Its importance lies in the fact that it is the *first inscription found* in excavations in Palestine which actually gives us the name of a person known in the Bible record and enables us by that fact to fix with certainty as Israelite the stratum in which it was found. Further, it confirms the biblical narrative which asserts the subjugation of Megiddo to Israelite power in the time of Solomon, who organized his father's conquests. But its chief importance lies in this: it shows that Palestinian excavations will give us written material by which we may control and more fully explain the Bible narrative. Many moot points of criticism to-day wait upon the discovery of written material in Palestinian soil.

Even as we write comes the information that the English explorers at Gezer, on the Philistine border, as one goes from Jerusalem to Jaffa, discovered on May 20th a tablet, "written in cuneiform character on both faces—thirteen lines on one face and five lines on the other, separated by impressions of seals." Here we are once more in the pre-Israelitic period, when the cuneiform writing of Babylonia was still used in the land; but the discovery is so far welcome as showing us the existence of the literary habit in Palestine. The seal from Megiddo which we have described is much more important than this tablet, because it comes from the Israelitic period after the Phenician alphabet had been substituted for the cuneiform characters.

It must be remembered that up to this time excavations have not been conducted at those sites which might be expected to yield the largest amount of true Israelitic remains. In Jerusalem excavations have been conducted only along the line of the walls. Outside of Jerusalem excavations have been conducted in outlying towns, like the towns on the Phenician border or the Canaanite towns on the plain of Esdraelon. To secure the best results in the recovery of Israelite remains, excavations must be conducted in true Israelitic sites, like old Samaria, which furnishes possibly the most promising field, and as yet a virgin field, in all Palestine. It is worthy of note that the excavators who have done the principal work of excavation in Palestine thus far have been Americans—Dr. Bliss, excavating for the Palestine Exploration Fund, and Dr. Schumacher, excavating for the German Palestine Association. It was American scholarship and American zeal also which, in the person of Dr. Robinson, first began the scientific exploration of Palestine. Why is it that, while American money is so liberally given to conduct explorations in Babylonia, in Egypt and in Greece, the comparatively moderate sum necessary to excavate Samaria cannot be furnished by Americans? Is there not sufficient interest in biblical exploration in this country to furnish the means to excavate a site like Samaria—and there are other sites

only a little less important? Our American excavators enjoy such a reputation in Palestine that they have been selected by foreign societies to conduct their excavations, but we do not employ them. English, Germans and Austrians are excavating in the Holy Land. Only we Bible-loving Americans cannot afford to conduct excavations there.

How to Educate Farm Boys

One of the Western agricultural colleges sends out this question: "To what studies would you advise a young man from the country to give special attention in his college course, if he desires to go back to the farm?" Agriculture has come to the front with remarkable strides, and is assuming its place once more at the head of the industries. Such a question as the above is pertinent to the age. It is no longer possible to farm it in a general way, without specific knowledge of that branch which is to be pursued. No industry is more specialized or will be hereafter more specialized than that of farming. There will be dairymen, pomologists, truck gardeners, and others engaged with apiaries, and others with small fruit growing. While these departments will overlap each other, yet each one will require very special training for success, under the laws of competition.

This does not mean that intensive farming has not come in to displace extensive farming, while the future farm will grow a large number of crops rather than be devoted to one or two. Besides its special hobby the new farm is certain to divide its efforts between half a dozen crops or more. In other words, the farmer will not have all his eggs in one basket. There will be less of one sort raised, so that the loss of a single crop by drought, or a failure to realize because of a glutted market, will still leave the farmer in good shape for the year. In fact, a specific knowledge of one department of culture, as, for instance, of small fruit growing, will require and involve a specific knowledge of bees. There will be fewer bankrupts on wheat, or on corn, or on potatoes, or on strawberries.

The young man who proposes to go back to the farm from his college training will have to consider, therefore, not only his specific work, but in a general way he must understand correlated sciences. A thorough knowledge of entomology must enter into his curriculum, whether he devote himself to cereals, to fruit, or to truck gardening. Every farmer must know his friends from his enemies among bugs or beetles, or he will surely be whipped from the field. It will be an unspeakable blunder if he be allowed to go through a college course and come out with a very general and loose knowledge about his chief rivals. It is a recognized fact that these minute creatures are the real competitors with human beings for the possession of the land and the crops. It has been said that not a plant exists without an insect enemy. This is not quite true, for they are no more the enemies of the plants they infest than we are. Many of them are beneficent associates of vegetable growth, and contribute to the health and the wealth of the trees they inhabit. It is man's business to find out which of these insects he can compel to co-operate with him in fruit or grain production, and which of them are inhospitable to his purposes. The farm boy who leaves college without entomology will be left behind in the race.

It is equally important that the student who is preparing himself for farm work shall enter into a very intimate acquaintance with bird life. We are just beginning to grasp the fact that the farmer has no ally to compare with these friends on the wing. Assent to this fact as strongly as you may, it will be a long while before it is so fully felt that our rural population will have entered into a systematic scheme for making the birds joyously at home on the farm. One of our ablest ornithologists argues that without the birds human beings could not possibly sustain life. However this may be, we are certainly dependent in orchard, field and garden upon the robin and his companions, more than upon all other appliances, in our battle with the insects. We have yet to learn how to count them into our families, and make our homesteads their safe and delightful resort.

Yet while we believe in special courses and industrialism for the farm boy—that is, for specific studies directly fitting him for his specific work—we are very far

from believing that he will be well equipped for his life work unless his curriculum is broadened out to take in more or less of what are called humanitarian studies. He should certainly be a good student of American history and of social economics. The time is now at hand when the farmer must and will emancipate himself from the leadership of professional politicians. Independent voters increase in number and influence. We are moving back to the day when our Presidents and Governors may be selected from rural life, as were Washington and Jefferson.

Bear in mind, however, that there is less danger of isolated thinking and intellectual side-tracking in agriculture than in any other of the pursuits. No other industry so reaches out toward collateral sciences and arts, and so readily co-labors with them. To study agriculture is, in fact, to study nearly every modern science—geology, geography, entomology, ornithology, chemistry. The farmer must also comprehend the laws of supply and demand. In fact, the educated young man, the wisely educated young man, we mean, will go back to the farm from his college training a statesman. If our diagnosis of the situation is anywhere near correct, the young man from the country will carry back to the farm, from his college course, a very distinctive, but fully as broad an education as that which is taken by the lawyer or by the minister into professional life.

We look to see the time, and not so far away, when no single class of men will be so generously, yet specifically, educated as farmers. A great deal may be eliminated from the present college curriculum. Agricultural colleges cannot be loaded down with complex courses in philology, pedagogics, psychology and ancient languages. Physics, however, will find place with biology. Perhaps we have not answered the question of our interlocutor as fully as we might, yet it is certain that the farm boy is going to be made after a different model than that which has heretofore ruled in collegiate life; nor have we the slightest doubt that education simply to make gentlemen will gradually be eliminated in favor of an education that will glorify work and express the fullest co-operation of the hands with the brain.

Radium and Conservative Medicine

THE usual curiously interesting but unfortunate series of events that practically always takes place when a new therapeutic possibility is introduced to the medical profession and to popular attention at the same time, has occurred with regard to radium. At first there was a period of surprise and more or less incredulity, then great exaggeration of the efficiency of the new substance in the treatment and cure of serious ailments that had hitherto baffled medical and surgical skill, finally a reaction from which it would appear that there is nothing at all in radium as a therapeutic agent, with a few attempts of quasi-scientific investigators to show that there never could be anything in radium, since its qualities are such as will not lend themselves to therapeutic uses. Beneath all this disturbed movement as reflected in the newspapers there is, however, a steadily progressive undercurrent of conservative investigation from which there come some encouraging reports of genuine observation with regard to the application of radium in medicine.

At the last meeting for May of the New York Academy of Medicine Drs. Piffard and Abbey both made encouraging reports with regard to the employment of radium and discussed the true scientific aspects and their relation to medicine of this new wonderful substance. There is no doubt at all that radium produces some wonderful effects upon biological processes. Seeds, for instance, that are exposed to the action of radium undergo some subtle change by which their development is very much retarded. If a definite number of seeds, for instance, be exposed to the action of radium for four days and a corresponding number for two days, a third set of the same number being kept in their natural state as controls, and if all three of these sets of seeds be planted, those that have been exposed to the action of radium grow distinctly more slowly than the unexposed seeds. The seeds which have been exposed longest to the action of the new metal show the greatest retardation. The most careful microscopic and chemical investigations of the seeds that have been exposed to radium, how-

ever, fails to show any distinct changes in them. It would seem as tho some true biological effect had been produced in the germinal material causing a retardation of the natural tendency to grow when the seeds are placed in favorable circumstances.

With regard to certain of the lower forms of animal life the effect produced by exposure to radium is perhaps even more striking than in the case of seeds. If the larvæ of certain insects, for instance, be exposed to radium for some hours some of them will be killed by the action of the radiations, but others will only be so affected in their vitality that they refuse to go through the ordinary cycle of changes which characterizes normal insect life. If, for example, meal worms be exposed to radium, some of them will die as a result, but many of them will survive, and instead of entering into the pupa stage, eventually becoming beetles, as healthy meal worms should, and then producing ova from which further larvæ that will pass through the pupa stage into the adult form originate, they continue a prolonged existence in the larval stage as meal worms. When control meal worms that have not been exposed to the radium have passed through three generations of existence, as pupæ, fully developed beetles, ova and larvæ, the exposed meal worms are still continuing their worm existence, Methusalahs who have long outlived their own generation.

With these wonderful biological effects in mind it is no wonder that physicians and surgeons have been encouraged to continue their experiments and observations, especially as regards the effect of radium on new growths in the human body. Some of them have met with very satisfying success. Certain benignant growths, as warts, can be made to disappear very rapidly and completely by one or more exposures to radium. The wart is a typical new growth, with many of the characteristics of certain forms of cancer, but without the characteristic tendency of a malignant growth to infiltrate the surrounding tissues. It is only a step, then, to the application of radium to external cancer of various forms, and in this some good results have also been obtained. Recurrent nodules of cancer, such as are found so often a year or two after the removal of malignant growths along the scar of the incision through which the removal was effected, can be made to disappear by exposures to radium when the specimen of the metal is of reasonable radio-active strength and the exposures are repeated often enough. Certain skin cancers, the removal of which by the knife is likely to produce serious scarring, can be kept in check by means of radium, and while observations have not yet been conducted for a sufficiently long time to make this sure, can perhaps even be radically cured by means of this substance. Lupus, the well-known form of skin tuberculosis which occurs so often on the face, especially on the nose, can be cured in certain cases by exposures to radium.

It would seem, then, of very great importance that further investigations with this precious substance should be continued by careful, conservative medical men, who will not rush into print with "half baked" results. The Finsen light has proved useful in just this class of cases, as have also the x-rays. Dr. Piffard considers that "the radium rays occupy an intermediate position between the x-rays and the Finsen light." As he very expressively puts it, radium is a "transcendentalized pocket edition of the x-rays," which can be employed without the cumbersome apparatus necessary for the production of the x-rays, and whose use apparently can be controlled better than that agent. He pointed out that the use of glass containers for radium does not allow of the exertion of all its radio-active energy and that small tubes made of aluminum are better for the purpose. Even through this, however, the emanations of radium, which are quite different from the radiations, find a way of escape, apparently through the pores of the metal, so that the aluminum tube has to be carried inside a silver tube to keep the radium at its highest point of efficiency. In a word, in spite of the reaction against radium in medical circles, its fate is by no means determined as yet, and there remains an extremely interesting field for investigation.

The Unit Rule

It is in the conventions of the Democratic, rather than of the Republican, Party that the unit rule has prevailed. Now the Demo-

cratic Party has claimed to be the special champion of individual rights and liberty, whether of citizens or of States. But the object of the unit rule is to suppress individual judgment and put all the delegates of a State under the control of the boss. Their constituents elect them to vote one way, but their vote is taken from them and cast in another way. At the convention in St. Louis nearly every State will be under this rule. This is unusual, but its object is to suppress Mr. Hearst, and to stifle any delegate who wishes to reaffirm the Bryanism of the Kansas City platform. There are Hearst delegates in almost every State, and Mr. Hearst will be robbed by this rule of the fruit of his expenditure of money and effort. Under this gag rule the minority is helpless. The result will be that a few leaders have things in their own hands. They can make combinations and nominate whom they will, for the delegates have no choice but to obey. The unit rule plays into the hands of the bosses, and they like it, but it is utterly undemocratic.

Comity in Marriage

This is the resolution on the remarriage of divorced persons adopted by a two-thirds majority of the Presbyterian General Assembly:

"Recognizing the comity which should exist between the denominations of the Interchurch Conference, and believing that it would be desirable and tend to the increase of a spirit of Christian unity, we earnestly advise all the ministers under the care and authority of this General Assembly to refuse to unite in marriage any person, or persons, whose marriage such ministers have good reason to believe is forbidden by the laws of the Church in which such person, or persons, seeking to be married may hold membership."

This is advice, not law, and not good advice in all cases. For example, we may suppose the Episcopal Church to enact a rule forbidding all remarriage of persons divorced for whatever cause. In that case the advice would, if generally followed, prevent the divorced persons from being married anywhere by a religious service, and would compel a civil marriage. It would put a social ban on people who have the moral right and duty to marry. The rule may tend to immoral license. This is hardly a matter for comity to control. A denomination has no more right to control the action in such cases of other denominations than it has of the civil authorities.

A Canal Zone Tariff

Secretary Shaw, opposing the Panama Commission's plea for free trade in machinery and other supplies for the canal zone, says that foreign manufacturers might, undersell our own on the Isthmus, if our own were not protected there by the rates of the Dingley tariff. If that tariff is to be applied to the zone's imports, our manufacturers should at least be required in some way to make their prices, to the Government or the contractors, as low as those by which some of them are now underselling foreigners in neutral markets and even at the doors of the foreign factories. The zone tariff, if there must be one, should be one to encourage competition and not one to protect the extortionate price agreements of rings.

Toy Pistols and Lockjaw

In Cleveland, the City Council has recently passed an ordinance making it a misdemeanor for any one to use, give away, or sell there on the Fourth of July a toy pistol or blank cartridge. Other cities in which no similar ordinance exists should do likewise. In Chicago, where an interesting experiment is to be made by a citizens' association that intends to supervise the use of comparatively harmless explosives, such as small fire-crackers, by school children in the parks and other playgrounds, the police will confiscate toy pistols, dynamite crackers or revolvers found in the possession of any one in the streets or other public places. The number of persons—nearly all of them boys between the ages of five and fifteen—who died in the United States last year of lockjaw caused by the use of toy pistols on the Fourth was 407.

The Oleomargarine Decision

The United States Supreme Court has just renedered a decision upholding the constitutionality of the law imposing a tax of ten cents a pound on yellow oleomargarine. We do

not question the legality of the decision, but we do the justice of the law. Under the fictitious guise of an act for raising revenue it has, as was stated by its supporters in Congress, for its real aim the prohibition of the manufacture of a cheap and wholesome article of food simply for the purpose of insuring to the dairymen a monopoly of oleaginous bread-spreads. As it is now, whatever comes from a barnyard, no matter how foul and infected with tuberculosis germs, may be colored with annatto and sold without interference, but if it is the product of a packinghouse, even tho composed of clean animal and vegetable fats and oils and completely sterilized by heat, it is taxed a quarter a cent a pound, or, if colored with annatto, ten cents. The eccentric nature of the law is still further illustrated by the particular case which was appealed to the Supreme Court, where a dealer was convicted for mixing together artificially colored butter and uncolored oleomargarine and selling the whole as oleomargarine. That is, the two ingredients are regarded as proper articles of food separately, but the mixture must be suppressed by excessive taxation. The difficulty is that the people have become used to a compound of a particular color, a color only occasionally found in butter and that not always the best, so neither butter nor oleomargarine is marketable unless it is tinted to this peculiar shade. If the consumer of butter has a right to demand that it be artificially colored to suit his taste, the consumer of oleomargarine has the same right. It is now held that the manufacturer of oleomargine is prohibited from using vegetable oils which are of a natural yellow color. The sale of oleomargarine as a substitute for butter should be prevented by law as far as possible, but not by the indirect and unfair method of placing a prohibitive tax on a legitimate food product.

Dr. Cranfill's Retirement

Dr. Cranfill, founder and editor of *The Baptist Standard*, of Dallas, Texas, pays the penalty of his fault by withdrawing as instantly from it as he did from the Southern Baptist Convention. It will be remembered that on the way to the Convention he met his rival and foe, the editor of the paper which represents the schism in the body, and drew and fired a pistol, without hurting any one. On reaching Nashville his brethren told him he had disgraced his Church and must not be seen; so on the next train he left town. Now he announces in his paper that he has sold out his interest in it, and leaves it, for the good of the cause, acknowledging that this "unspeakably grievous affair," which he will not now explain, "tends to bring reproach upon the Christian ministry in particular, and the cause of religion in general." So he feels it his duty to withdraw, awaiting judicial investigation. His two associates, men high in honor in the Baptist denomination, follow his statement, each with one of his own, taking up the task he has dropped, but neither uttering a word of sympathy or any mention of him beyond the acknowledgment by one of them that his "relations with Brother Cranfill, the retiring editor, have been very pleasant indeed." What they omit we will supply. Dr. Cranfill has done admirable work in the past for temperance and religion. We don't know what provocation led to his sudden and deplorable act of attempted violence. We trust he will not, to use a classic expression, "step down and out," but that he will confess his sin to his church and have the courage to recover his good name and good service, remembering what Henry Clay said to the man who was displeased with his vote on some subject and was about to desert his banner: "When your rifle misses fire do you throw it away? Do you not pick the flint and try it again?"

The Birth-Rate in Australia

Malthus based his theory of the pressure of population on the means of subsistence upon the high birth-rate under natural conditions, as in the British colonies in America and Australia, where there is plenty of land and sparse population. These conditions still exist to a great extent in Australia, but evidently natural processes are there not allowed to act, for recent statistics show that Australia has about a million less population than there should be according to the ordinary increase. The birth-

rate is falling continually and in New South Wales the marriage age of women is nearly a year and a half later than it was in 1885. With a large part of the continent still practically empty, and threatened with an actual decrease in population, the Australian Government is each year putting up the bars against immigration, so that now it is almost impossible for a skilled laborer to enter unless those of his own craft consider that his labor is needed; a conclusion which naturally they are not ready to reach. What is still more alarming, it appears that all that saves the country from a real decline in population is sexual immorality. In New South Wales, out of every 1,000 first-born children, only 510 result from the marriage relation. Of the rest, 233 are legitimized by an urgent marriage and 257 are illegitimate.

The Chinese in South Africa

While the British Government has given consent to the importation of Chinese laborers in the South African mines, and a few have already been taken there under rules of the strictest seclusion and practical imprisonment, it is by no means clear that this permission will not be reversed under the Liberal Government that is likely to come into power at the next election. The fact is that the great mining companies control the newspapers in South Africa and the main sources of public information. They complain that the natives will not work; and why should they at twenty-five cents a day in mines from one to four thousand feet under ground, when they can get better wages or profit in other work? Because the natives are unwilling to work at these figures, the scare editors talk of the danger of Ethiopianism, and tell us in the London *Times* that the native question will assume a dangerous form if a competent leader should arise, and they tell of American agents coming as leaders. We know all about these leaders. They are the missionaries of the African M. E. Church, and all they are doing is to establish churches and marry couples living irregularly. They want no uprising or rebellion, only liberty to do Christian work. If the Chinese are willing to come as coolies and work for twenty-five cents a day, they make no objection.

Mrs. Hearst has discontinued her large annual contributions for the support of several semi-philanthropic institutions connected with the University of California. We are not ready to believe the published report that this action was taken because of the extreme difficulty with which her son obtained the support of a bare majority in the California Democratic convention. If this explanation be the true one, we shall expect to see fresh essays upon the familiar topic of "academic freedom," considered from a new point of view.

Civilization requires the census, and we have now taken the census of the Philippines and have counted a population of 7,635,426, of whom 647,740 are classified as wild and uncivilized. With our methods of Government and the work of missionaries, the best civilizers, it ought not to take many years to civilize even the head-hunters and the dwarf negritos, who have resisted Spanish influence these centuries. About a third of them persist in the hill country of Luzon, not very far from the city of Manila.

Those who wish to be presented to the Pope must kneel—such are the fresh instructions. That is all right, but those of us who do not care to kneel to any man are under no obligation to be presented. There must be rules of etiquet in all courts, to which visitors shall be required to submit, and the courts have the right to make their own rules. Only we cannot quite understand why any mere man should want his fellow men to kneel to him.

There are in the world two nations in which the liberty of the press is so restricted that even foreign newspapers are scrutinized and objectionable matter blacked so as to be illegible. The two are Turkey and Russia. They stand at the very foot of the countries that wish to be called civilized.

Insurance

The Ethical Aspects of the Plant Suicide

THERE has been a tendency in certain quarters to laud the conduct of R. H. Plant, of Macon, Ga., who committed suicide last month in order to realize on his life insurance for the benefit of his family and his creditors. Some writers in the daily press have even found something decidedly heroic in his act of self-destruction, which was deliberately planned and executed. Mr. Plant was admittedly sane. He was a man of large affairs, but, finding himself bankrupt, he killed himself in order to pay his debts and provide through the insurance companies a quarter of a million dollars for the use of his wife. The man had been for a long time the agent of one of the more prominent life insurance companies. He understood the principles which are the basis of life insurance, and knew full well the effect of maturing a policy in advance of its normal period. It is fair to assume that he was also well aware that at his age his expectation of life, according to the mortality table, was twenty years, but he chose, by means of suicide, to deliberately deprive the insuring companies of premium payments covering the period of life expectancy cut off by self-destruction. Whether his act was heroic or decidedly dishonest from an ethical point of view depends in large measure upon the contracts he had with the companies that had accepted him as an insurance risk. If his policies contained a suicide clause which set forth that they were not to be vitiated by anything except the non-payment of premiums, his act of terminating his life under such circumstances was perhaps heroic; but if, on the other hand, the question of suicide was not contemplated by the insurance companies interested, his method of anticipating the maturity of his policies, if not robbery, was but a short remove therefrom. In such a case he joined hands with a class already alarmingly large who consider it legitimate to defraud the Government, to beat transportation companies and to "do" corporations generally.

The insurance involved in the Plant case was not far from $1,000,000. There is at least a doubt that Mr. Plant was heroic, and there is also a possibility that he robbed Peter to pay Paul, if with the money of the insurance companies his estate pays the depositors of the wrecked Plant banks.

JAMES W. ALEXANDER, President of the Equitable Life Assurance Society of the United States, lectured before the students of the Yale University Course of Insurance on June 6th. His theme was "The Hazard of Inexperience." In the course of his remarks he stated that in Connecticut alone the life companies reporting to the insurance department of that State had accumulated funds that totaled over $2,175,000,000, and the insurance in force in these same companies was over $8,700,000,000. Almost the whole of these enormous sums plus over $3,000,000,000 which has been paid out by these companies in the shape of matured policies, dividends of profits and surrender values has been rolled up during the last fifty years. The address was a very able one and carefully prepared in every way.

....Dispatches from York, Pa., set forth that Mr. Charles Newman, a farmer living near Vineland, N. J., was seriously injured during the latter part of May by the explosion of a hen's egg in process of incubation; he was examining it to see if it contained a chick. The drum of Newman's ear was broken by the exploding egg and he suffered much pain. The incident points to a new accident hazard that ought to have serious attention from accident underwriters.

....A recent estimate of the amount of insurance carried by companies at the World's Fair at St. Louis, places the total at $10,000,000 in round numbers, including concessions to the Pike. The various buildings carry an insurance of $2,000,000, which the World's Fair officials have not yet canceled, altho it was expected that they would do so as soon as the fair opened.

Financial

National Income and Outgo

Owing to extraordinary payments for the Panama Canal ($50,000,000) and the St. Louis Exposition ($4,600,000) the Government's accounts show a deficit of $54,730,413 for the month of May. For the fiscal year to June 1st (eleven months) an excess of expenditures amounting to $52,271,841 is disclosed. Secretary Shaw's estimate was that the year's surplus would be $14,000,000 (against $38,948,000 last year, and $73,908,000 in 1902); but it will be seen that at the end of June the surplus (the two large payments mentioned above excluded) probably will not exceed $2,000,000 or $3,000,000, and that, if these large payments are included, there will be a deficit of about $50,000,000. But the Treasury has a cash balance of $163,000,000, exclusive of the gold reserve. During the eleven months there was an increase of about $5,500,000 in the receipts from internal revenue and miscellaneous sources, but a decrease of $22,700,000 in the customs revenue. Military expenditures were less by $2,500,000, but navy expenses rose from $74,861,000 to $93,809,000, and pension payments were larger by $3,000,000. On the other hand, the Indian service expenses were decreased by $2,000,000, and there was a saving of $4,000,000 in interest. It will be difficult to avoid a deficit in the coming year.

Exports of Manufactures

In the current fiscal year our exports of manufactures will exceed those of any previous year, surpassing even those of 1900. For the ten months ending with April the total was $371,712,301, against $339,108,000 in the corresponding months of last year, and $352,671,000 in 1900, the year which has held the record. The increase is found chiefly in the exports of copper, mineral oil, and iron and steel. Our shipments of cotton cloth have fallen off from $22,000,000 to $12,000,000, owing mainly to the condition of trade with China. For the ten months, sales to China have dropped from $12,500,000 to $3,250,000. In April they were only $62,000, against $1,608,000 in April, 1903. Compared with those of last year, the imports of iron and steel and of manufactures of the same have fallen off from $43,000,000 to $23,000,000, but exports have grown from $79,800,000 to $89,000,000. This increase of exports is due largely to reduced demand at home and to the low prices fixed for the export trade. For example, last week's trade papers reported sales by the Steel Corporation of steel plates for export at prices netting only $20 per ton at Pittsburg, where the price to American buyers is $32. In this instance the discount to the foreign buyer is 37½ per cent.

Notwithstanding the prevailing dullness in the iron and steel trade, the bar iron pool, following the example of other pools in the industry, has decided to maintain the old prices.

....At its recent annual convention the Savings Bank Association of the State of New York declared "that it would be unwise for any savings bank in this State to purchase bonds of the proposed issue of the Chicago, Rock Island & Pacific Railway Company."

....In 1903, Argentina's exports ($220,984,000) showed an increase of 23 per cent., and her imports ($131,206,000) were enlarged by 27 per cent. The increase of her entire foreign trade in ten years has been nearly 90 per cent. Imports from this country in 1903 showed an increase of 20 per cent.; exports to the United States a loss of 19 per cent.

....Dividends announced:

International Paper Co., Preferred, 1½ per cent., payable July 1st.

U. S. Leather Co., Preferred, $1.50 per share, payable July 1st.

Manhattan R'way Co., quarterly, 1½ per cent., payable July 1st.

St. Louis and San Francisco R'way, quarterly, No. 11, $1.00 per share, payable July 1st.

Minn. & St. Louis R.R., Coupons, payable June 1st.

Iowa Cent. R.R., Coupons, payable June 1st.

Southern Pac. Co., various Coupons, payable June 1st.

The Independent

Vol. LVI NEW YORK, THURSDAY, JUNE 16, 1904 No. 2898

Survey of the World

Attorney-General Knox Becomes a Senator

The vacancy in the Senate caused by the death of Mr. Quay was filled on the 10th inst. by the appointment of Attorney-General Philander C. Knox. Governor Pennypacker explained at length why he had not called a special session of the Legislature. The movement in favor of Mr. Knox was a surprise to the politicians and did not come to the knowledge of the public until the 8th. It had been conceded that the appointment should be given to a resident of the western end of the State. Several persons there, among them Henry C. Frick, a prominent Director of the Steel Corporation, were regarded as candidates. It appears that on the 7th Mr. Frick was in New York in consultation there with ex-Senator Cameron and other persons concerning the vacancy; that Mr. Cameron then went to Philadelphia for a conference with President Cassatt, of the Pennsylvania Railroad Company (a Democrat); Senator Penrose, and Insurance Commissioner Durham in the interest of the appointment of Mr. Knox; that Mr. Frick arrived in Philadelphia on the 8th and at once permitted the press to know that he was working in behalf of Mr. Knox, and that Mr. Frick and Mr. Cameron passed the night with President Cassatt. It was on the 8th that the place was offered to Mr. Knox, and he at once communicated with President Roosevelt by telephone, obtaining his consent that the appointment might be accepted. The Philadelphia newspapers agree in saying that several meetings were held in Mr. Cassatt's office and that the final and decisive conference took place there on the 9th. Later on the same day the Republican leaders of Pittsburg accepted the action thus taken, and in the evening the projected appointment was made known, and formally accepted by Mr. Knox, at a dinner in Mr. Cassatt's country-house, among those present being Governor Pennypacker, Mr. Knox, President Baer, of the Reading Railroad; Mr. Frick, ex-Senator Cameron and Clement A. Griscom. "It is no secret," says the Philadelphia *Press*, ex-Postmaster-General Smith's paper, "that Mr. Knox is not the first choice of the party leaders in Allegheny County. He was presented by the business interests, which in that county are apt to be listened to when their wishes are expressed." The appointment is warmly commended by the *Press* and generally by the Republican newspapers. On the other hand, the Democratic newspapers assert that Mr. Knox has been taken out of the Department of Justice by the Trust and railroad interests, to which he was hostile there. They remark that Mr. Frick, a prominent officer of the Steel Corporation, is regarded as representing there in part the interests of Mr. Rockefeller; that Mr. Cassatt's company is interested in the Steel Rail Association and the combination alleged to exist in the coal trade. Published statements from many Democratic legislators and politicians show that they substantially agree in expressing the opinion that Mr. Roosevelt was "willing to placate the Trusts," or had "surrendered" to them. It is said by some that Mr. Knox in the Senate will represent the President's policy concerning corporations and will suggest legislation there in accord with it. Mr. Knox says that the President told him he thought it was his duty to take

the place, because his appointment would promote harmony in the party and open the way for a long term of public service. His retirement, he adds, cannot interfere with the enforcement of the laws affecting Trusts, because the President's Trust policy was his own, and there is no scarcity of men competent to carry it out. The term for which he is appointed will expire in March next, but it is assumed that he will be elected for the ensuing full term. It is reported that the President would like to place Ambassador Choate at the head of the Department; also that he may promote William A. Day, who for some time has assisted Mr. Knox in prosecuting the Trust suits.

The Field of National Politics

An increase of voting strength for the Republican party in Oregon is shown by the results of the election last week in that State, when members of Congress, a Judge of the Supreme Court and subordinate State officers were chosen. The Republican plurality was about 20,000, which may be compared with 13,000 for McKinley in 1900 and 10,000 in the same year at an election similar to this one. There were increased pluralities in the two Congressional Districts, the sum of them being nearly 20,000, against 15,000 two years ago.—Speaker Cannon still says that he does not want the Vice-Presidential nomination and will not take it. He is to be permanent chairman of the convention. "If I should be nominated," he remarks, "I would decline, and then direct the clerks to call the roll for other nominations." At present, Senator Fairbanks is the leading candidate for the place. Ex-Senator Wolcott has been invited and has consented to make the nominating speech. As Colorado is near the head of the alphabetical list, Mr. Fairbanks's friends think that other State delegations thereafter may accept him. It is said that he is unwilling to make a contest with any one for the nomination. The orators selected to nominate Mr. Roosevelt are ex-Governor Black, of New York; Senator Beveridge; George A. Knight, of California; Joseph B. Cotton, of Minnesota; Harry Stillwell Edwards, of Georgia, and Henry S. Cummings (a negro), of Baltimore. Mr. Cummings is a lawyer of recognized ability, who made a good record in the Council of his city.—Recent State conventions have increased the number of Democratic delegates who will vote for Judge Parker, but only about 200 have been positively instructed in his favor. A prominent Democratic paper that has canvassed the delegates gives him 321, and it is generally expected that he will have not less than 450 on the first ballot. Mr. Hearst's friends have published a table claiming for him 180, against 175 for Judge Parker. They rely upon contests, and even assert that 18 of Indiana's 30 delegates (all instructed for Parker) will vote for their candidate. At the beginning of the present week they claimed a clear majority of the delegates elected for the convention in Illinois. The delegations of Hawaii and Idaho have been instructed for Mr. Hearst. In Colorado, a Hearst resolution was defeated by a vote of 4 to 1. Instructions were given for no one, but Mr. Bryan was warmly commended. In the Delaware convention instructions were given for Judge Gray, but, he says, against his expressed wishes. He supports the candidacy of Judge Parker. Virginia's convention, following the advice of Senators Daniel and Martin, gave no instructions and declined by a vote of 818 to 728 even to indorse Judge Parker; but it is understood that both Senators and nearly all of the delegates intend to vote for him. At the Kentucky convention, Mr. Hearst gained little or nothing in return for the hard work of his friends in that State. There was a factional contest between Governor Beckham and his followers on one side, and the two Senators on the other. The Governor's friends were victorous by a vote of 2 to 1. By a larger majority the convention declined to consider a Parker resolution. But it is expected that the State's vote will be cast for Parker, under the unit rule.—Mr. Bryan publishes in his paper the long protests sent by Governor Altgeld to President Cleveland when the latter ordered Federal troops to Chicago at the time of the riots.—A long interview with Mr. Hearst has appeared in a few papars. His own candidacy, he says, is of no moment, except as it bears upon the question whether the progressive element of the party shall prevail. In his opin-

ion, the one preponderating issue this year is that which is created by the Trusts—an issue growing out of the exactions of Trusts that seek to create monopolies in the necessities of life, and out of the depredations of Trusts that are purely speculative. "I shall be entirely satisfied," he adds, "if my candidacy so crystallizes this issue that it will neither be overlooked or neglected."

Isthmian Canal Questions

Dominick J. Murphy, who was Commissioner of Pensions in Mr. Cleveland's second term, has been elected Secretary of the Panama Canal Commission. Mr. Murphy is a lawyer in Washington, where he has recently been the editor and owner of a Catholic weekly, *The New Century,* in which the attitude of our Government toward the friars in the Philippines has been ably defended against the hostile criticism of some other Catholic journals.—Final action concerning the currency of Panama has not yet been taken by the Legislature of the Republic. Because the question is one of great importance to the United States it has become the subject of earnest discussion at Washington, where it is being considered by a mixed commission consisting of three representatives of Panama, Admiral Walker, Secretary Taft and several other officers of the War Department. At one of the meetings last week Secretary Taft emphasized the importance of having a stable currency on the Isthmus. The basis, he said, must be satisfactory to the United States. If provision were made for the use of much silver, there must be an ample gold reserve. For such a reserve Panama has made no provision. It is expected that the gold standard will be adopted, with regulations like those imposed in the Philippines for maintaining the parity of the silver coins that will be in common use.

Colorado's Labor War

Following the murder of fifteen non-union miners by an explosion of dynamite at the Independence railway station, in Colorado, at 2 a. m. on the 6th, there were riots in Victor, where two men were shot at a mass meeting called to protest against the crime, and the miners' union hall was attacked by the militia. Drastic measures were at once taken to preserve order and deprive the union men of all power. The sheriff, formerly a union miner, was forced by the Mine Owners' Association to resign. His successor appointed 1,000 deputies, who began to scour the hills for union miners. The City Marshal, who had begun to swear in and to arm union men as deputies, was deposed. A vigilance committee took charge of local governments throughout the county. Many peace officers in other towns were deposed; some of them were arrested and placed in the barracks, or "bull-pen," where 200 union miners were already in custody. On the 8th military rule, required by "a state of insurrection and rebellion," was proclaimed for the county by the Governor, and Adjutant-General Bell took command. A commission was appointed to examine the prisoners and to report concerning those who should be expelled or deported. At Dunnville, a small mining settlement, about 50 miners in camp were raided by the militia. The miners began the shooting, but they were soon put to flight. One was killed; a dozen were captured. On the 9th General Bell closed the famous Portland mine, alleging that it was "harboring dangerous and lawless men," who gave aid to others who were breaking the laws. It appears that half or two-thirds of the 600 employees were union men; the other mines (employing non-union men) had been closed since the dynamite murders at Independence station. It was ordered that men employed in the mine must have cards issued by the Mine Owners' Association (of which the company is not a member), and that this must be the rule in all mines of the district. Unknown men wrecked the office and machinery of the Victor *Record,* an organ of the union, which had urged that the strike be called off. It has not been ascertained by which side the attack was made, but the strikers had ceased to be active. A movement for the extermination of all unions was started, and an agreement for a boycott against them was signed by all to whom it was presented. Search for the murderers

of the fifteen miners was made. The man who exploded the dynamite had fled. General Bell expected, he said, to capture him. He declared that he had evidence enough to convict 40 of his prisoners; 60 of them were transferred from the "bull-pen" to a prison, where they are held on a charge of murder. Women belonging to auxiliary branches of the miners' union were warned against making incendiary remarks. Joseph Hamilton, chairman of the Democratic County Committee, was summoned before the Commission. Because he admitted that he had expressed opinions in favor of labor unions he was ordered to leave the county within four days. Parties of union prisoners have been deported by rail every day. At first they were sent to Denver, but later they were escorted into Western Kansas, where, on the 10th, 91 were left on the prairie. Ordered out of the State by a Kansas sheriff, they began to make their way westward. All the deported have been warned that if they return it will be at the peril of their lives. The union (Western Federation of Miners) has formally denounced the crime committed at Independence station, and has offered a reward of $5,000 for the detection of the murderers. It has also asked President Roosevelt to investigate "the terrible crimes being perpetrated in Colorado in the name of law and order." The Supreme Court of the State, in a decision relating to the application for a writ of habeas corpus in the case of the president of the union, for some months past a military prisoner, sustains the Governor in the action taken under military rule.

The Visiting Filipino Commission

The Honorary Board of Filipino Commissioners, consisting of 48 prominent natives of the islands, arrived in Washington on the 9th, and became the guests of the Government. Responding to an address of welcome from District Commissioner McFarland, Dr. Pardo de Tavera (of the Philippine Government Commission) explained that the Filipinos had fought against the Americans because it was feared that the civil and religious tyranny of Spain would be continued under American rule:

"We did not know at the time of the beneficent purposes which animated you. But so soon as we learned what these purposes were we were glad to accept the conditions. None of you can appreciate the emotions which welled up within us when our eyes rested upon the White House, within whose walls your beloved President McKinley evolved the intention of stretching out his beneficent hand to us to raise us up to the plane upon which you now stand, and place within us the same beliefs that you now have in this great country."

At a reception in the office of the Secretary of War the guests listened to a brief address from Secretary Taft, who promised, if Mr. Roosevelt should be elected in November, to revisit the islands on a tour of inspection. He was sure that all of them would feel that in his office, as at Manila, there was an intense desire "to preserve the Philippines for the Filipinos." He reminded them that the law providing for the election of a popular Assembly in the islands empowered the President to decide when the condition of the islands warranted such an election. It would be necessary for him (the Secretary) to ascertain by personal inspection whether the time for the Assembly had arrived:

"We shall not be satisfied, as long as the majority continues in the House and Senate as it is, until we obtain the legislation which you and I know is necessary for the full development of the Philippine Islands. I have every confidence that the bill which has passed the House and is pending in the Senate will pass that body in a more or less amended form, and when it does pass, American capital will go into those islands for the construction of railroads and such other works as are necessary to make the islands produce what they ought to."

Replying to the Secretary, Dr. Pardo de Tavera said that the sentiment of a mass meeting held in Manila at the time of the Commission's departure was one of gratitude. The people expected that the visit of the Commission would make a new bond of union between the islands and the States:

"And they charged us very expressly and explicitly to convey to the Government of the United States their perfect faith that the people of the United States and the Government would only work for the benefit of the Filipino people. They charged me further to state to

the Government that the phrase which you have used to express concisely and concretely the policy to be followed by the Government of the United States with respect to the islands, that the Philippines are for the Filipinos, they do not consider as a phrase of only your own, but as illustrating the intentions and purposes of the American Government and the people of the United States toward the islands. And they also charged me to say to you and the Government that they were confident that as the time when the Philippine Assembly could be organized is left to you, they were fully convinced that when you make your promised visit you will realize that the time will be ripe for its establishment."

Ricarte, the captured insurgent leader, has not been sent back to Guam, but has been sentenced to be imprisoned seven years for conspiracy and for carrying concealed weapons.—In Cuba there is talk of another loan of $12,000,000 or $15,000,000, to be used in paying the soldiers and in making roads.—Judge Wickersham, of Alaska, has decided that the native Eskimos and Russian half-breeds of that Territory who have settled habitations are citizens. This does not make them voters, but it gives them new rights with respect to mining claims, land titles, pilot licenses and the like.

French Politics

It is reported that the Pope is deferring any action toward a reconciliation with the French Government in the expectation that Premier Combes will not long retain his office and in the hope that his successor will be less antagonistic to the Church. Whether the fall of the present Ministry is imminent or not is, however, highly uncertain. M. Combes is well supported in his anti-clerical action, but he is now being atttacked by the Socialists on the ground that he is using the religious agitation merely to keep himself in office, and as a cloak to cover his inactivity in the direction of the social reforms to which he is pledged and which they consider of much more importance than his war against the friars. M. Millerand, the Socialist ex-Minister, in a debate in the Chamber of Deputies on Friday last charged Premier Combes with betraying the cause of social reform, when the Premier retaliated sharply, by taking advantage of an interruption. One of the members on the Right shouted: "What about the Carthusian millions?" to which he responded: "That is one of the most painful recollections of my life. I sacrificed certain proof of an infamy committed against me to high political considerations." In reply to an interpellation concerning the scandal he said he was glad to reveal the secret which had weighed upon him, and stated that in December, 1902, his son, Edgar Combes, who was Secretary of the Ministry of the Interior, was approached by M. Lagrave, now Commissioner of France at the Louisiana Purchase Exposition, offering $400,000 if M. Combes would bring in a bill authorizing the Carthusian monks to remain at Grande Chartreuse. The production of *liqueurs* at Grande Chartreuse is immensely profitable to the monastery and they could undoubtedly afford to pay much larger sums for the privilege of remaining undisturbed. M. Lagrave refused to give the name of the person for whom he was acting, but stated that it was known to M. Millerand. M. Combes claims that M. Millerand came to him and begged him not to divulge the names for important political considerations. Amid great excitement a parliamentary commission of 33 deputies was ordered to make a full investigation of the matter.—The French Naval Budget presented to the Chamber of Deputies provides for a total appropriation of $62,000,000, which is $1,050,000 more than was called for in the budget of the present year. The increase provides for a reorganization of the coast defense and a reserve division of armored cruisers for the northern squadron, and a division of torpedo boat destroyers for the Asiatic squadron. The Minister of Marine, M. Pelletan, expressed regret that the amount asked for does not permit him to increase the number of torpedo boats and submarines to a greater extent, stating that the immense utility of these vessels has been proved by the Russo-Japanese war.—The Foreign Minister, M. Delcassé, in reply to the request of a Socialist member, M. De Pressensé, that France should make a naval demonstration against Turkey in order to stop Armenian persecutions, gave the results of the official investigation of the French Consul in the Sasun (Sassoon) district. It showed there had been a number of bloody combats, and villages had been captured by the troops and destroyed, but

it was impossible to estimate even approximately the number of villages destroyed or the number of people killed. Some accounts said that twenty-five villarges and others that fifteen villages had been destroyed. There was no doubt the uprising resulted in the killing of many rebels and also in the death of many peaceful peasants.

The British in Tibet

The Tibetans continue to show a strange mixture of personal recklessness and military incapacity. Their long isolation and devotion to a religion of non-resistance have left them incapable of either comprehending or resisting the invaders. They endeavor to frighten the English by yells and gesticulations from the walls, and by howling like wild animals around the camp at night. The easy task of attacking the supply trains and cutting communications with India, which would have been the first thing done by the most ignorant savage tribe, does not seem to have occurred to them, and the British receive their food supplies and morning papers with almost unfailing regularity. Yet they keep up a continuous and obviously futile bombardment of the British post at Gyangtse, and sacrifice themselves in hopeless but repeated charges. The British post at Khangma on the road to Lhasa was attacked by 1,100 Tibetans with great ferocity. The British losses were one Ghurka killed and five wounded, while the Tibetans left 174 dead around the post, and many others were killed in the pursuit. The lamas are going through the country preaching a holy war and endeavoring to arouse the people to destroy the invaders. According to Russian advices the excitement is extending to people of Mongolia and among the Russian Kalmucks and Buriats. If the Mongolian tribes are induced to go to the assistance of the Tibetans the situation of the British would be precarious, since they are great fighters and form as fine a force of irregular cavalry as the Russian Cossacks. The British occupy the village of Chung-lo, about 1,500 yards from the town of Gyangtse. No attempt will be made to take the Yong, or fort of Gyangtse, by storm, as it is a strong tho ancient castle standing on a steep hill some 600 feet above the valley. This is being undermined by a tunnel from the British camp for the purpose of blowing it up.

Ordination Controversy in Sweden

In the Swedish Church a controversy has arisen not unlike the Apostolicum discussion in Germany several years ago, when Professor Harnack advised the theological students with advanced views to petition the Government to cut the Apostles' Creed out of the ordination vow. In Sweden the candidate is by law compelled to take upon himself the work of the ministry "in accordance with the sacred books of the Old and the New Testament and in accordance with the Unaltered Augsburg Confession, as this was directed by the Congress of Upsala in 1593." Modern theology has found its way into the Swedish Universities, too, and the students joined in a petition asking that this ordination vow be changed in such a way that a man with more modern views could also with a good conscience enter the Swedish ministry. The General Church Congress, held in 1903, adopted a changed formula, in which the candidate promises to preach in accordance with Scriptures and the Confessions, "according to his best knowledge and conscience." The Government asked a formal opinion of the Consistories on this innovation, and has now received two reports. The majority declares that the Government must sanction the changed formula, but favors the new wording; the ministry are opposed to any change, chiefly on account of the danger involved for the confessional status of the Church as such. Protests of a determined character are coming in from various sections of the Church, but as the Cultus Minister is a liberal, it is generally expected that the students will have their wishes gratified.

The Russo-Japanese War

There is no reliable news this week from the Kwan-Tung peninsula. From Che-Foo there have been daily reports of the bombardment of Port Arthur and of important battles in the vicinity, but Che-Foo has been the source of so many wild rumors during the war

that it is impossible to tell what progress the Japanese are really making toward the investment of the stronghold. They apparently have plenty of time at their disposal to arrange for siege or assault. General Oku's forces have no difficulty in keeping above Polan-Tien the small Russian army which occupies the upper part of the Liao-Tung peninsula, and General Kuropatkin shows no disposition to move southward from Liao-Yang in force, probably for fear that such an expedition would be taken in the flank or rear by the Japanese at Siu-Yen, only forty miles east of the railroad. During the week important forward movements have been made by General Kuroki on his left and right wing in the capture respectively of Siu-Yen and Samaja. The attack on Siu-Yen was made by the first and third army corps in co-operation; a force moving southwest from Feng-Wang-Cheng at the same time that the troops which had been landed at Taku-Shan approached the town from the southeast. On the morning of June 8th a Japanese infantry brigade, two mountain batteries and five squadrons of cavalry attacked on the south and east, but were held in check by the Russian artillery. After a two hours' fight the Cossacks holding the pass on the east of the town were driven back, but the Japanese could not approach, on account of the heavy Russian fire. In the afternoon the Japanese made a flanking movement to the northeast, threatening to cut off the line of retreat, and in consequence the town was evacuated. The Japanese loss is reported at 100 and the Russians only one killed. Samaja, north of Feng-Wang-Cheng and on the road to Mukden, was taken by the Japanese on June 7th, with a brigade of infantry, two batteries of artillery and three squadrons of cavalry. The Russian loss was about 100 and the Japanese 300. General Kuropatkin has his headquarters at Liao-Yang, where he eats, sleeps and works in a railroad car divided into three rooms. From Russian sources it is reported that two battalions of Japanese marching westward from Feng-Wang-Cheng toward Hai-Cheng on the railroad and about 30 miles from this point, were ambushed in a ravine, and were practically annihilated by rifle and artillery fire from above at close range.—The Japanese have purchased the "Protector," a submarine boat invented by Simon Lake, and built at Bridgeport, Conn., in 1902. The boat was offered to the United States Government for $250,000, and on account of her novel construction was the subject of much popular interest and of several debates in Congress. At the banquet following the launching of the vessel, Baron Ferson, of the Russian Embassy, who was a speaker, said:

"The 'Protector' is a wonderful fighting machine. But I don't believe the United States will ever let her get away from her own shores."

The Russian Government tried to buy her, but Mr. Lake considered it his duty to give his Government the first chance. The boat was smuggled out of the country most ingeniously. The storage batteries, weighing 80,000 pounds, which run her when submerged, were shipped to Japan over a month ago, and the "Protector" was run to New York by her gasoline engines. There she was taken on board the "Fortuna," a Norwegian steamship, and shipped as cargo. The Russian papers accuse the United States of violating its neutrality by permitting the boat to leave.

The Kongo Atrocities

The correspondence between the British Government and that of the Kongo Free State has been published. The Kongo Government complained that the report of the British Consular agent, Mr. Casement, does not give the names of persons and places in the accounts of instances of brutal treatment of the natives by officials and traders. If these details were furnished the Kongo Government would investigate the charges. The Foreign Secretary, Lord Lansdowne, in reply, said that the names and dates were withheld because such particulars, if published, would be accessible to the officials in the Kongo to whom abuses were attributed. They would thus have an opportunity of exercising pressure on the witnesses or of concealing the evidence of their own malpractices. He mentioned an instance in which such witnesses had disappeared.

The Kongo Government replied that the witnesses had probably disappeared after giving false evidence to Casement. Lord Lansdowne stated his readiness to furnish all the information at his disposal to a special commission, composed of persons not connected with the Kongo State, which should be appointed with power to collect evidence and protect witnesses. Sir Charles Dilke in the discussion of the Casement report in the House of Commons advocated an appeal to the United States to act with Great Britain in making a searching inquiry. He thought the time had come

"to sweep away all the difficulties and force the Government to act by stronger measures than mere words and dispatches with reference to this horrible scandal."

The Under Secretary for Foreign Affairs, Earl Percy, said that the Casement report had been submitted to all the Powers and that the United States, Italy and Turkey has assured the British Government that they would give it their earnest consideration. The other Powers said they believed their material interests were not sufficient to warrant active participation in the matter. He charged the officials with permitting "insensate, inhuman cruelties to be practiced that they might profit by the collection of rubber." It was not a question of the existence of the sovereignty of the Kongo State, but of the fair fame of Western civilization, the reputation of that creed upon whose principles that civilization was based.

Morocco In international politics it has been found that the easiest way to gain control over a country is to loan it money. In accordance with this policy the French control of Morocco will begin with such a loan of money, which, of course, the Sultan greatly needs. The Government offers to loan $10,000,000 from the Bank of Paris, but since a French trading company, the Compagnie Marocaine, offers the same amount at a lower rate of interest the Sultan naturally wishes to accept the latter. This, however, does not suit the purposes of the French Government, so the official loan will probably be forced upon him. There has been much indignation expressed in Germany and in Spain because of the way the interests of these two countries in Morocco were ignored in the recent convention between England and France. The Pan-Germanic Congress meeting at Lubeck on May 30th declared it is "imperatively necessary for the political and business interests of the Empire to acquire a foothold on the Atlantic Coast region of Morocco." Count von Pfeil said it was a national misfortune that 32,000 German emigrants yearly sought the shores of the United States, when there was a large territory at Germany's doors, whose acquisition would not cost any difficulties worth mentioning.—The release of Ion Perdicaris is expected this week, as the Sultan is willing to pay the ransom, $70,000, and grant the conditions imposed by Raisuli, who will then become legal Governor of the district he now controls. An interesting letter from Mr. Perdicaris to his friend, A. J. Dawson, the novelist and traveler, gives an interesting account of the kidnapping:

"Nothing more startling and unexpected than the circumstances of our capture could be imagined. A quiet domestic dinner without guests, the windows open, the table a mass of flowers, then suddenly, like an avalanche, the yelling onset of Raisuli's men—it was a classic scene of rapine and confusion; nor would it be easy to conceive a picture more wild and gloomy than our forced journey; in fact, the libretto was perfect.

"It is easy now to write in this strain when we are assured that negotiations for our release are concluding, but during that terrible twenty-four hours' ride, over rocks and bowlders, and through dense thickets, where our captors had at times literally to cut their way in order to avoid the villages on the beaten track—well, we had no such consolation then—none of any sort indeed.

"You may conceive my feelings while being dragged along by ruffians, who began their amiable attentions by clubbing us with rifles and threatening us with their murderous looking curved daggers. I was astonished to learn that our fears were not really well founded. We have learned that Raisuli's chief object is to secure the release of members of his own Kabyle, unjustly or at least treacherously entrapped and imprisoned by the Bashaw of Tangier.

"Another startling surprise is to find in Raisuli himself the most interesting and kindly hearted native gentleman it has been my good fortune to have known. It is impossible not to like the man, conscious as I am of the injury all at Tangier suffered at his hands."

Domestic Economy

BY CHARLOTTE PERKINS GILMAN

Author of "Women and Economics," "The Home," Etc.

ONE of the strongest intrenchments of our piously defended system of household industry is its supposed economy. "The careful housewife" is our ideal of a wise and judicious expender of money, some even going so far as to call her a "partner" in the business of housekeeping. A recent defender of this view, Mr. Robert Webster Jones, writing in the March *House Keeper,* says definitively:

> "In the ideal marriage husband and wife are equal partners. Two departments engage the energy and attention of the firm, the earning department and the home department. One is as important as the other. Each requires an expert, industrious, watchful manager if the home is to be successful. . . . His wife is doing just as much as he is for the success of the firm, if not more."

If this is a true position, it does, indeed, go far to justify our methods of living, even if they are archaic. But is it?

Let us give a fair examination to this particular point, the economy of domestic industry, not touching on any other aspect of the question.

Merely as a matter of business, is it good business?

What is, exactly, the business we are to study?

It is that of catering to the personal physical needs of the human animal, caring for the health of the body, providing shelter, warmth, food and cleanliness. There are additional minor clauses and there are some very important psychic associations; but we will only discuss here the material side.

The home is intended to furnish shelter and protection to the family—sleeping accommodations, food, and those cleansing processes so essential to all civilized life. The business of the home is in the rent or purchase and replenishment of the place and plant; the provision of supplies for consumption; the preparation and service of food, and all kinds of cleaning. What is commonly called "housekeeping" really embraces this group of industries, arbitrarily connected by custom, but in their nature not only diverse, but grossly incompatible.

We are familiar with each as a business by itself; as in the service of cooked food, long practiced in the many forms of eating house; in the furnishing of shelter and rest at night, as in lodging house or dormitory; the cleaning of the person and of clothing, as in bath-house or laundry; the nursing of the sick, as in hospitals; the care and training of children, as in nursery or school. All these forms of specialized human business are known to us, with their skilled officials; but in our common thought—and practice—we hold that they are better done in the lump, at home.

As separate businesses we can plainly see their incompatibility. No man advertises a "Restaurant and Laundry," or "Bakery and Bath-house"—the association of fresh food and soiled linen or unclean bodies would not be pleasant to our minds. Neither should we patronize a "Kindergarten and Carpet Cleaning Establishment," or "Primary School and Dressmaking Parlor," and, above all, should we avoid a dormitory for adults which was at the same time a nursery for infants. In the care of the sick, for their sakes as well as the other interests involved, we isolate them as far as possible; a hospital naturally striving for quiet and cleanliness.

Yet we carry on all these contradictory trades in one small building, and also live in it!

Not only do we undertake to have all these labors performed in one house, but by one person.

In full ninety per cent. of our American homes there is but one acting functionary to perform these varied and totally dissimilar functions—to be cook, laundress, chambermaid, charwoman, seamstress, nurse and governess.

But one character in history or fiction

can approach this position, the sole survivor of the shipwrecked "Nancy," who so cheerfully relates:

"O I'm the cook and the captain bold,
And the mate of the 'Nancy' brig;
And the bo'sun tight and the midshipmite.
And the crew of the captain's gig!"

The average housewife can similarly boast:

"O I'm the cook and the seamstress neat,
And the nurse when ills betide;
And the laundress jade and the chambermaid
And the governess beside!"

The person who is expected to achieve this miracle is not some specially selected paragon of varied ability, but merely the average woman; neither is she prepared for her herculean tasks (Hercules was never required to perform his twelve labors *all at once!*) by a rigorous course of training, but is supposed to be fitted by nature for their successful achievement, aided perhaps by instruction from a similarly well prepared predecessor. Under these circumstances the wonder is that even half of us live to grow up, that our average of intelligence and ability is so good, and that our common standard of comfort and cleanliness, of health, vigor and peace of mind is as high as it is; that any degree of family happiness remains to us; and it is no wonder whatever, but an inevitable consequence, that the waste and incompetence manifested in this pitiful business constitute so huge a loss and injury. Let us examine the waste first. Wealth is increased by productive labor. Whatever checks, reduces or weakens that labor is a loss to us. Wealth is diminished by unnecessary expenditure in time, labor or money. Our domestic administration wastes nearly half the productive labor of the world, and costs three times what it need cost in time, labor and money.

This method of running six great businesses in one unsuitable shop, by one unsuitable person, is expensive. The labor of the world is performed by men and women. In harems, it is true, women are exclusively maintained for purposes other than economic, and in our scanty proportion of "upper classes" the same ideal is upheld; but in the great majority of the population the woman, vigorous and valuable, works, as she has done from the beginning of human life. The proportion of women in America who keep even one servant is shown by our last census to be about one to sixteen.

The fact that most women are not paid for their labor does not deprive them of economic value, tho it does of economic independence. Slaves were not paid, yet were worth good money in the market.

Half the labor of the world is woman's labor.

The waste under discussion is this: We take half the people of the world and set them to wait upon the other half, thus limiting the output of their labor exactly as it would that of a lumber camp if half the men were assigned to wait upon the other half instead of chopping wood; or of an army if half the soldiers were "keeping tent" instead of fighting; or of a ship's crew if half the sailors were cooks.

In any body of civilized men specialized labor meets the needs of the group, a certain number being employed in each industry; and as machinery and organization improve, it takes fewer numbers to do the same work, thus setting free more human power to meet higher needs and increasing wealth.

In savagery each man, wholly unspecialized, spends all his time and labor on his immediate physical needs, and not only can do nothing else, but does this most miserably. For each man to require one other man to thus take care of him is but one degree better than savagery, and the degree is not raised by the other man's being a woman. The amount of productive labor wasted is that between the number of people really required to carry on their trade in proper business methods and the present number—half the adult population.

Among the rich in our cities, or wherever servants are kept, we increase the waste of labor, and also that of purchasing and depreciation of plant.

In the primitive family group, where the wife is the servant, many interests combine to make her exert herself to the best advantage, to do as much and spend as little as possible. The enlarged group, where two or more women are doing this same kind of work, adds to every element of expense and loses the earlier tendency to cautious economy.

We should also recognize in this connection that a superior family with servants involves an inferior family to furnish them. Where all families are well to do, no servants are obtainable.

The real unit of domestic industry is the family itself. Where servants are added we have a sort of feudal group, and in admiring the smooth workings of a large, well managed, wealthy household we should hold clearly in mind those subsidiary cottages or tenement rooms in which reside the tributary families without whose assistance the large one could not exist.

Let us consider the economic aspects of this business of housekeeping in a residential block in New York, a group of well-to-do families, where the income is five or six thousand dollars a year.

Such a block has about one hundred families, to which we will give the census average of two adults and three children. Here is a schedule of their expenses, a conservative and low average, well within the limits of fact: Labor is given as that of three house servants, cook, second maid and nursemaid, at $5, $4 and $5 a week, and an outside man to clean sidewalks and attend to the furnace, etc., at $50 a year. Food is allowed at $4 per capita per week—not that it need to cost that, but that, with a group of eight and the waste incidental to servants, it generally does. Interest and depreciation on plant the housewife will recognize better as breakage and wearing out. We have made a very modest allowance for it. Laundry expense we will allow at $3.50 a week—a woman for two days and two meals—this will be included in the labor item. The schedule stands thus:

	Per annum.	
	Per family.	Per block.
Rent	$1,500	$150,000
Food	1,664	166,400
Labor	960	96,000
Fuel and light	50	5,000
Interest and depreciation	50	5,000
	$4,224	$422,400

Let us now see how these ends could be better served. We will assume the following treatment of the block and its businesses:

One hundred houses average six floors, counting the cellar; say, twelve rooms. The cellar and basement floor are now generally used as the workshop part of the domestic plant, the top floor for children and servants, leaving the family the dining-room and parlor floor and two floors of bedrooms. Now let the cellar and basement be eliminated from the domestic scheme entirely, and the top floor (save one room), with the roof, be devoted to the children; that leaves to the family proper all the space it had before.

The underlying space, equal to that of thirty-three entire houses (note that a full third of our living space in a crowded city is now devoted to the domestic trades!), we will use as follows: Space of two entire houses for kitchen; not a small, dark, dirty place with the cellar below, the laundry in or adjacent, and all manner of unpleasant concomitants, but a white, light, high-ceiled, well ventilated, beautiful and scientifically appointed laboratory, with its allied offices. The space of another house for a laundry, equally attractive and well fitted; of another for the heating plant of the block, and of one more for offices and rooms of such resident workers as were necessary. This leaves the space of twenty-eight houses, or, spread out as it is in two lower floors, a little more than both the long sides of the block, to be fitted up as gymnasia, swimming pools, ball room, club rooms of all sorts, for the use of the residents.

The roof space—entirely freed from smoke and dirt by the removal of kitchen and cellar from under our houses, the one heating plant and food laboratory carefully consuming all smoke and waste—becomes an ideal playground for children. The upper floor is also fitted for child culture; large, sunlit nurseries and other accommodations with rooms for resident attendants. Space of one room on this floor might be reserved to each house, with its little hall and entrance to this children's department, so that the family would have precisely the space it has now, minus only the workshop and servants' rooms. At what cost and by what service may the needs of the family be met better and more cheaply?

Let us assume the entire block to be owned by one man, previously yielding him $150,000 a year in rents.

He now lets to the families seven rooms each—the same space formerly occupied—for $120,000. This includes heat.

He lets the upper floor (minus the one room and small hall and stair) and roof to the manager of the children's department for $20,000. He lets the cellar and basement to the food laboratory, laundry and manager of the recreation rooms for $20,000.

Thus the landlord gets $10,000 a year more than he did before, which may be applied to cover the expense of his large heating plant, etc. (tho, to be sure, that ought not to cost more than a hundred small ones!) At any rate he will not lose by the change.

For the family rent is now somewhat reduced. The bill for fuel and light we will roughly cut in half, for lack of exact figures, the heat being supplied as in an apartment house, but the family using light as before. The interest and depreciation on plant go down tremendously, all the waste and breakage of 300 incompetent servants and 100 separate plants being replaced by the efficient small corps in one kitchen, one laundry, one "cellar." It may be estimated at $500 a year each in the three—$1,500 in all—something less than the $5,000 now paid by the block! But the main items are food and labor.

The laundry work was done by 100 women working two days a week for each family at $1.50 a day and dinner; $3.50 a week, per year $182, for the block $18,200. This allows ten dozen pieces to each family. This work could be done by twenty skilled workers in a proper shop at $10 a week each, for $104 per family; $2 a week—20 cents a dozen.

The cleaning essential to a neat and sanitary home of seven rooms could be done in an hour a day by two skilled workers at 25 cents an hour—$3 a week—$156 a year per family.

The outside man, whose labor we estimated at $50 a year per family, has resolved himself into the reduced bill for heating, and a contract to clean sidewalks for the block, which might be $500 a year—something less than the present $5,000 paid to 100 men by 100 families.

The food bill itself we can at once reduce by half. Where eight people, with the waste of three servants and the laundress, and the hopelessly extravagant individual buyer—100 small purchasers of no special training—make this item average $4 a week per capita, one expert purchaser buying for 500, with a special dairy, a special truck farm or equivalent arrangement with butcher, grocer and market gardener, would easily reduce it to $2 and give better food.

Now for the kitchen labor. Here we will be extravagant. No crude, ignorant, fluctuating horde of 100 low class women will be intrusted with the health of 500 people. Our food laboratory will be served at this rate:

Food for 600 (allowing for one servant)				$62,400
The families paid for this number			$124,800	
Rent				2,000
The families paid for kitchen space, girls' room, etc., equal to two floors			50,000	
Fuel, etc.				500
The families paid			2,500	
Interest and depreciation				500
The families paid			5,000	
Labor:				
1 manager, per week	$30	$1,560		
1 bookkeeper, "	5	780		
1 head cook, "	25	1,300

Food served at dumbwaiters and dishes removed: 3 meals a day at $3 per capita per week				$93,600
				88,330
Annual profit for food company				$5,270

This establishment, it will be observed, is not a restaurant. It does not have to pay rent for eating space in the business part of the city, nor to allow for an immense margin of waste with varying customers. It has a steady number of patrons, who can order their preferred dishes in advance if they choose, or pay somewhat less for a well arranged *menu* which shall make of the weary housewife a cheerful guest, or both. You carefully order your dinner—by telephone, of the manager—all at once, instead of ordering it of a number of tradesmen after discussion with the cook. That dinner, perfect-

ly prepared and hot, comes into your pantry by the dumbwaiter, as it does now. What difference does it make to your family happiness that it was not steaming through the halls beforehand? It is better food, far better cooked. If your devout regard for the privacy of the family leads you to insist on a stranger in the room to wait on you, that may be had by paying for it.

Perhaps the "simple living" for which so many sigh will lead us to be content with fewer dishes and our own mutual service.

The soiled china returns, as it came, by dumbwaiter.

And what is to become of the servants? They can learn to be higher grade workers. It is no advantage to society to maintain an immense number of extremely inefficient persons.

One other item remains, the nursemaid. As one feature in the labor expense we paid her $5 a week and board, $4—9 × 52 =$468 a year; for the block, $46,800. Let us call this item child culture and see what we might get for the money.

Of our 300 children, some 200 will be of nursery age. For their care and training we will now engage, not an ignorant and irresponsible young girl, but as fine a woman as love can lead and long study and training fit to care properly for little children.

Such a woman, as tho starting a private school, hires the children's department of the block for $20,000 a year. This is fitted up with all nursery and kindergarten appointments, with sand and sun and water rooms, gymnasia for little ones, and the great playgrounds and gardens on the roof, at an expense of $50,000, on which is paid a yearly rent of $5,000.

For attendance we will have ten skillful, experienced women at $25 a week each, ten at $15, and service at $10—$50 a week, $2,600 a year. The head of such an undertaking should have an income of $4,000, making the total $55,000. Among 100 families $550 each. This is $82 a year more than is now paid for the nursemaid, but it includes kindergarten and also roof privileges for the older children. The difference in value received is appreciable, and if further saving is wanted it could be found in doctor's bills. The health and happiness of these little ones would be cheap at a far greater price.

The $300 our families have saved on rent goes to cover "club dues" in the recreation rooms below. Instead of having under all our houses dark and disagreeable holes, where no one goes who does not have to, we have now places of rest and amusement. The aggregate of $30,000 yearly would provide a good deal of healthful amusement for two hundred people—a quiet domestic casino in each block.

Now, how does the account compare?

By the domestic method:

Rent	$1,500
Food	1,664
Labor	960
Fuel and light	50
Interest and depreciation	50
	$4,224

This sum is paid for crowded houses full of ill-adjusted industries, for uncertain, low class labor, and constant care and worry.

By organized industry:

Rent	$1,200
Food, served	785
Fuel and light	25
Laundry and cleaning	265
Child culture	550
Club dues	300
	$3,120

The saving in cold cash is not great, only $1,104; but the gain in value received is vast. If a servant is still kept—at $5 a week and $3 for food—that reduces the saving to $688 per family—$68,800 for the block. But even that, with such improvement in accommodation, is worth considering.

Of course, all these figures are approximate and arbitrary, based merely on estimates of what families like this now pay, and what can be done in somewhat similar combinations. It should be noted that the family is in no way interfered with; the children remain at home—and have more of a home than they ever did before. The economic advantages are impressive enough, but the added ease and happiness in living, especially for children, is the main point to be considered after all.

New York City.

A Negro Student's Summer Vacation

BY CLIFFORD L. MILLER

[We print the following article just as it was submitted to us. The author is a student at Fisk University, Nashville, Tenn.—EDITOR.]

EVERY summer vacation I employ my time in waiting on table to earn means to pursue my education. In fact, almost all the colored young men, who are thrown largely upon their own resources, either wait on tables or work for the Pullman Company for means to pay for their education. There is no remunerative work open to us in the South; and in the North we can hardly find anything to do except as waiters or railroad men. After the schools close all the young men who can secure transportation, go North to find employment in some of the numerous resorts, or on the railroads. My own experience in the North during one of the vacations will suggest what experiences and troubles hundreds of students undergo every summer, that they may continue their course of study in various schools throughout the South.

I had often heard from the lips of waiters, of the great resorts in the East, where good salaries and humane treatment were received. Fully aware of the awful condition of things in some hotels in the South in which I had worked, I decided one year to cast my lot in the East. New York City is the rendezvous for head waiters of some of the leading hotels in that section of the country. Waiters from all parts of the country, but prinicpally from cities along the Atlantic Coast, congregate there that they may book with these head waiters. Experience had taught me that it was a waste of time for a stranger to correspond with a head waiter, altho he may be highly recommended by responsible persons in his community. The sending of stamps and stationery even will not induce them to write. A stranger is booked only after he has actually seen the head waiter.

Now, when I set out to New York to book with a head waiter I did not know with whom it would be or where I would have to work during vacation. I have experienced the good fortune of finding a good situation without any waiting, but this year my patience was sorely tested. I arrived in New York on May 30th, and it was just a day before July 4th before I went to work. I reported to a head waiter who I was told was engaged in one of the best resorts in the East. After gazing on me and asking a few questions he told his secretary to book me. I explained to him that I was a student just from school, that my resources were not plentiful and that I was anxious to begin work at once so as to have money enough to pay all my school expenses. My words seemed to have some effect upon him and he assured me that he would employ me as soon as he could, but the cool weather was unfavorable to the opening of this resort until the last part of June.

In the meantime necessity forced me to make many inventions to find work and earn money to carry on expenses. I asked other head waiters for work, but they gave me less encouragement than the former one. I perused the "want" columns of the papers daily, but saw no suitable place. I also reported frequently to a head bell-man to whom I had been highly recommended, but he said that he was cutting off bell-boys daily, owing to the fact that guests were leaving the hotel for the summer vacation. Every evening I could look back on a day faithfully spent in a fruitless search for a remunerative situation in a large city.

But one day a postal informed me that I was expected to report as a waiter at a famous watering place on Jersey coast. I heard the summons and gladly obeyed the call. On my arrival I was received by the head waiter in comfortable quarters. Said I: "I shall, I know, be satisfied with my quarters." But I was informed that I was in the room of officers and that my sleeping place was in another building. This was a long, square building of two stories, hidden from the

gaze of the public. It was partitioned off into six dormitories, each of which contained about thirty bunks, which were made in groups of four—two were above and two below. In each dormitory there were about four windows, so small that they did not give sufficient ventilation. Every bunk was used when the season had fairly begun. While I had never seen such an arrangement in my life, still I was determined to be contented with my new mode of living, which would not last long, but heat, bed-bugs, mosquitoes, impure air, tobacco smoke and a noisy set of men, with restless energy, made the season drag. At my own request I was assigned a lower bunk in a corner, which, I hoped, was secluded, as I like privacy about my bedroom, but I was greatly disappointed when I discovered that I had the most noisy corner in the building. In the adjoining room next to the wall was a gambling table, frequented by a crowd of waiters, who were continually jesting, laughing and making boisterous remarks; besides, a professional caller, who had good lungs, would cry out continually every night in this fashion: "Throwed five; throwed seven; throwed eleven." This was not the only game of chance, for the waiters in the dormitory where I was had one. On account of the seclusion of my corner, it was selected as the most desirable place to play cards. At first I made no complaint of this intrusion, but after a fight took place at the foot of my bunk, which awakened me, I went to the head waiter and asked for a resting place somewhere else. He readily complied to my request by giving me a bunk among a very talkative set of old men, but on the whole my change was for the better.

The Negro Waiters' Dining Room

Every servant comes to a resort to make a good season; some come determined to make it at any price. Our head waiter had many schemes to make a good season. He sold jewelry and clothing, disposed of valuables by raffle, lent money at exorbitant rates, and compelled every waiter to purchase, even if he was already supplied, a white vest, aprons and a jacket, from which he realized a nice profit. No small part of my salary of only twenty-five dollars a month was taken out to pay for these articles.

The work at this hotel is arduous for every one, since a high standard of serv-

ice is rendered and since everything used in the dining room is kept in good condition. Work was especially hard for those who did not frequent the games of chance,—I never heard of any of the students gambling at this resort,—from which the head waiter received a large percentage of the rake-offs. When the waiters who ran these games had fed their people they would deliberately leave without doing any of the vast amount of drudgery connected with waiting. There was a rumor that a limited number of waiters who would not gamble were welcomed, as the bulk of the side work would be done by them. Every third day I worked, as a rule, from six in the morning until eleven o'clock at night, often later. During the day I seldom had any time to claim as my own. I wonder if the colored waiters will ever have only eight hours of work every day. In a European *café* in Boston I worked eight hours one day and fourteen the next. These long hours that waiters have to work are largely responsible for some of the dissipation that is indulged in by waiters, for most of them feel the need of recreation after a hard and long day of labor. The pressure of my work often forced me to disregard my habit of daily devotion and reading of either current news or literature, because the hotel absorbed all my time. The large number of visitors who frequented this resort on Sundays and holidays used to compel even the gamblers to toil laboriously. We never had the opportunity to attend church services, and waiters need to have the gospel expounded to them about as much as any other class of men. Sunday is a day of grunts and sweats instead of rest and joy, for waiters. Besides, our work is augmented on this day and holidays, but our salary is not increased proportionately.

The waiters most favored in this hotel were those who courted the good will of the head waiter. They served persons who are termed "good people"; other waiters waited upon the "no good people," or "snakes." The "good people" are those who tip liberally; the "no good people," those who tip meagerly; the "snakes," those who do not tip at all. The family I had to serve all the season came in the second class. Calculation showed me that I would not realize my school money from my salary and tips from my family, unless funds should come from some other source. I offered my services to a few waiters to keep their tables set at a reasonable sum, which they readily accepted. A nice sum was also earned by standing extra watches. Transient guests, who usually tip well, were always stopping at this hotel. My table was set up again immediately after my family was through eating, to catch transient guests; but whenever the floor officers judged the transients to be "good people" they would seat them at the tables of the favorites, but if "no good people" or "snakes," the other waiters experienced no trouble in having as many people to wait on as they wanted. But on Sundays and holidays, or when there was any special drawing card, all waiters had more people to wait on than they desired.

The hotel was negligent in providing for conveniences for waiters such as every human being needs. We had no chairs or tables in our sleeping quarters; we had no suitable place to take baths, yet the head waiter constantly insisted on personal cleanliness. The vast Atlantic was not twenty yards away from the hotel, yet there was a rule that prohibited the servants from enjoying refreshing sea-water baths during the day. During the night some of us would take them after the seashore had been deserted by the noisy throng. If we wanted to spend our off evenings reading we could not do so on account of dim lights. Altho quick service is required, the china closet where warm dishes are found, the kitchen where meat and egg orders are filled, the bakery where bread is procured, the pantry where fruit, butter and cream are kept, were so far apart that it took much time to fill an order and necessitated many steps and much haste. The hotel had an inadequate supply of silver, which often caused waiters to have to make a search all over the dining room to get enough silver to give the guest a set up. On Sundays and holidays there were more guests than dishes with which to serve them, and this invariably, in waiters' language, "put them up a tree." Often at dinner a waiter would have to remain at the steam

table where roasts are served as long as ten minutes for an order of roast beef. The cause of slow service is regarded a fault of the waiter, when, in most cases, it is a fault of the hotel. When a waiter has spent any length of time in the kitchen the guest often says: "Why, George, did you get here? I thought you had gone to sleep;" while a few will knock on the table and make some unpleasant remark, and if you attempt to explain they will call the head waiter and tell him about a waiter's prolonged stay in the kitchen.

The Negro Waiters' Sleeping Apartment

A certain amount of roughness is prevalent among hotel men. Before dawn, in order to get the early morning watch up, the captain of that watch had a big board, which he would strike with herculean strength against the posts of every one's bunk. Only one-fourth of the waiters were on this watch, the rest did not report for duty until six o'clock; still he would use no discrimination, altho he knew well all the men on his watch. He had a mechanical way of striking his board against every bunk, which he persisted in doing all season. About half-past five there was a greater disturbance. I shall not soon forget how I was aroused from my slumber, when I had not been long at the resort, by the head waiter using freely on me his paddle, and I found every one getting into his clothes as if the house was on fire and in the meantime laughing at me. The head waiter went about every morning with his paddle to awake us, and any one who did not chance to hear him coming received a good paddling. Of course, he does this in a jovial way, which creates laughter, but suffice it to say his method of getting the day watch up did not meet the approval of the judicious.

The way the help is fed is a shame, but I can say this resort fed better than some hotels in which I have worked. The cooking was poor. Tainted meats were made up into stews for us; stale fish and vegetables were used. The help's dining hall was not kept clean and service was done by what are called around a hotel "hamfat waiters," who are so termed because they are slovenly in their appearance and throw the food before the servants in a careless and indifferent way. The dishes used for the

help were cracked and chipped china cups with no handles; plates, with pieces broken out. The food would have been more palatable if the tables had had table cloths, if the oleomargarine had been kept on ice, if the china had been plain but whole, if the ventilation had been better, and if the service and cooking and choice of food had been simple, but good. I did not wonder when I observed that there were some waiters who never came to the help's hall for their meals; I was not surprised when I learned that the actual waste and theft of food around this hotel would have more than fed all the help; I was not astonished when I discovered that many waiters had indigestion and foul stomachs, because they ate hurriedly whenever an opportunity presented itself. While in school I enjoy the privilege of eating at a clean table, with wholesome food on it, which makes my heart go out in sympathy for any one who has to eat such food as I had to for a whole vacation.

Slang, cursing and vulgarity were indulged in freely by most of the help and some of the guests. If you resented their vulgar stories they made life a burden. Our head waiter had a foul mouth and delighted to exhaust his vulgar vocabulary on certain trifling waiters. Every one, apparently, took cursing good naturedly, for most every one cursed when vexed, as one often is in a hotel. Once a captain cursed me freely for something I had done. Not long afterward I went to him and asked him kindly never to curse me again, as it was distasteful to me. He assured me he would comply with my request, but added that if I were a hotel man in the true sense of the word I would make no such request. The effective way for cursing to be crushed out is for the officers to keep their lips unpolluted by profanity and discharge any servant who persists in using vile language. Many of the guests will curse a waiter for the least mistake he may make in serving them, while there are others who will say many disrespectful things, as if there were no true gentlemen among waiters. I have always felt that the guests exercise too much freedom when they call waiters "Bill," "Paul," "Jack," "George," "John" and "Charlie." The name waiter will always attract the attention of any waiter. If you resent any name they may call you, you are termed an insolent, impudent and uncouth waiter. The people whom I have observed enjoy having a servile rather than a manly waiter serve them. I knew an old waiter who could, by fawning and cringing, get tips out of people who were never known to tip. A waiter with manly bearing is genteel, but not subservient. He would not stoop to make a tip by being servile. But too often the tip a waiter makes by fawning must be shared with cooks, who make three and four times as much salary as he, in order to get quick service and choice food. Cooks, dish washers and pantry men help waiters to earn tips who distribute among them money, cigars and drinks.

If ability and character were expected of every man employed in the hotel, life in a hotel would be more pleasant and the moral atmosphere more wholesome. Waiters in hotels are employed who can do the work; their characters are never considered; hence, around a hotel you find as many unprincipled men as you find anywhere. It is a common thing to see an unreliable man watching the interests of the hotel. It would be a great deal better to employ only honest men than to hire floor walkers to watch the dishonest ones around every hotel.

I loathed to serve drinks to the guests, but all waiters must or be discharged. Some of my guests drank moderately, but most of them immoderately. They would sit down to the table with the purpose of taking only one drink, and when they left they had taken several. In such cases I felt that the persons were harmed, and I could not feel right in my own mind when I had had a hand possibly in wrecking a human soul. The guests often leave costly drinks which they do not care for. This is a great temptation to the weak. Who can tell but that much of the intemperance among waiters is due to their yielding to just such temptations, which come often? It is easy for a waiter to form the opinion that nearly all inmates of a hotel drink, as the exceptions are those who do not drink.

When the season, which is seldom longer than two months and a half, is

nearing a close, servants are cut off daily. At this hotel servants were beginning to be dismissed during the last days of August. I became anxious, but I was fortunate enough to stay to the close of the hotel with my family, who would have protested had I been dismissed. But I saw some diligent waiters, among them were some students, go, while lazy ones were held.

This summer's experience, which is one of my few, will suggest not only the troubles and experiences of colored students, but what a large number of professional waiters have to undergo from year to year. Do you wonder that so many waiters have no ideals? The waiter's life can be made happier if his salary is increased enough to warrant no tip taking, if his quarters are made comfortable, if games and reading rooms are provided for him, which would be good substitutes for his games of chance.

When conditions are improved around the hotels, then the student's summer vacation will be better designed to afford him more joy and less trouble.

NASHVILLE, TENN.

Convention Representation and the Party Strengths

BY PETER J. HOBAN

[As Political Editor of the *Public Ledger*, of Philadelphia, Mr. Hoban has attended all national conventions which have been held during the past fourteen years and has held intimate relations with the leading men of all parties. His special study in national politics has been disproportionate representations in national conventions, a subject which, unfortunately, has received more attention from practical politicians than from the men devoted to the higher interests of both great parties. In the course of this unbiased and completely analytic article Mr. Hoban presents comparative tables which have never previously been compiled, considers critically the much discussed Payne plan for representation, and presents, in full detail, another plan which is now suggested in order to meet the objections that have been found to have a bearing upon the Payne proposal.—EDITOR.]

"UNEQUAL representation" in Republican National Conventions is a problem that invites solution every four years. There is little difference of opinion among the party managers as to whether the present representation—four delegates-at-large from each State and two from each Representative District—is out of proportion to the party strength in the several States. It is contended that it gives the Democratic States greater power in the selection of the Republican national candidates than they should have, in view of the fact that those States are more than likely to cast their electoral votes for the Democratic ticket.

This question has not been pressed at previous National Conventions because, when the leaders were united on a Presidential candidate, there was no necessity for a change, or because, when they were divided, the deals they had entered into with delegates from Democratic States prevented consideration of the subject.

Of course, Republican leaders from Democratic States insist that the present system of representation is the best that can be devised; that any other plan would discourage the party organizations in their States and lead to a decrease in the Republican vote in their sections. Yet the Southern delegates have the reputation of being influenced more by self-interest than loyalty to party interests when it comes to voting for candidates in a National Convention. Even Presidents who want a second term recognize this material consideration by taking care of Republican leaders in Democratic States who can control their delegates in the next National Convention.

Politicians who have attended National Conventions, when there has been a con-

test for the Presidential nomination, have observed how much effort was expended to capture and hold Southern delegates. It has frequently happened that the representatives from Democratic States have held the balance of power in conventions and have prevented the nomination of the most popular candidate. In the Republican National Convention of 1888 John Sherman charged the political managers of Russell A. Alger with diverting the delegates from the Southern States from his support, thus constituting a deadlock which resulted in the nomination of Benjamin Harrison, who had only 80 votes on the first ballot, while Sherman led with 229 votes.

The Republican candidate for a Presidential nomination is nearer the goal of his ambition if he can obtain the support of the 72 delegates from Missouri and Texas than he is with the votes of the 68 delegates from Pennsylvania. Yet the 36 electoral votes from the two Southern States are certain to be cast for the Democratic national ticket, while the 34 from the Keystone State will go to the Republican Presidential nominees. This shows, with sufficient obviousness, the inequality of the present system of representation in the Republican National Conventions. But there are more striking inconsistencies.

At the last Presidential election South Carolina polled 3,579 Republican votes. The State is entitled to 18 delegates in the next National Republican Convention —one delegate for every 199 votes cast in 1900. New York polled 822,013 Republican votes four years ago, and is entitled to 78 delegates in the Republican National Convention this year—one delegate for every 10,539 Republican votes. If the basis of representation were the same for New York as it is for South Carolina, the Empire State would be entitled to send 4,131 delegates to the next National Convention; or, if South Carolina were restricted to the same proportionate representation as New York, it would only be allowed about one-third of a delegate. Mississippi is not much better than South Carolina in this respect. It has one Republican National Delegate for every 288 Republican votes polled in 1900.

The following table shows the number of Republican National Delegates from every State, the Republican vote polled for Presidential electors in 1900, and the average number of Republican voters represented by every delegate to the Republican National Convention:

REPUBLICAN STATES IN 1900.

States.	National delegates.	Republican vote in 1900.	Number of voters to each delegate.
California	20	164,755	8,238
Connecticut	14	102,572	7,327
Delaware	6	22,535	3,756
Illinois	54	597,985	11,074
Indiana	30	336,063	11,202
Iowa	26	307,808	11,819
Kansas	20	185,955	9,297

Rhode Island	8	33,784	4,223
South Dakota	8	54,530	6,816
Utah	6	47,089	7,848
Vermont	8	42,569	5,321
Washington	10	57,456	5,745
West Virginia	14	119,829	8,473
Wisconsin	26	265,866	10,226
Wyoming	6	14,482	2,414
Total	622	5,860,149	9,421

DEMOCRATIC STATES IN 1900.

Alabama	22	55,634	2,529
Arkansas	18	44,800	2,489
Colorado	10	93,072	9,370
Florida	10	7,314	731
Georgia	26	34,994	1,346
Idaho	6	27,198	4,533
Kentucky	26	226,801	8,723
Louisiana	18	14,233	790
Mississippi	20	5,753	288
Missouri	36	314,092	8,722
Montana	6	25,373	4,227
Nevada	6	3,849	641
North Carolina	24	132,997	5,541
South Carolina	18	3,579	199
Tennessee	24	123,180	5,132
Texas	36	130,641	3,629
Virginia	24	115,865	4,823
Total	330	1,359,375	4,120

In 1900 the Republican States polled 81.17 per cent. of the vote cast for McKinley and Roosevelt, while the Democratic States, that gave their electoral votes to Bryan and Stevenson, polled only 18.83 per cent. of the entire Republican vote. In the next National Convention the Democratic States will have 330 delegates, 34.65 per cent. of the entire number from the States. Every one of these delegates will represent 4,120 Republican voters, while the delegates from the Republican States will each represent 9,421 of their party voters.

To effect a combination that would dictate the selection of candidates for President and Vice-President, the delegates

from the Democratic States and from the Territories would need the assistance of only 131 votes from Republican States. If the Republican leaders in New York and Pennsylvania, with their States back of them, made a deal with the representatives from the Democratic States and Territories, they would control 508 votes, or 15 majority, in the next National Convention, and they could force the nomination of any candidates they agreed on, altho their combination could not count on giving to the ticket more than 76 of the 239 electoral votes necessary to a choice.

In the National Convention of 1900 Senator Quay submitted a plan prepared by Postmaster-General Payne, Vice-Chairman of the Republican National Committee, to change the method of representation. It provided that each State should be entitled to four delegates-at-large and one additional delegate for each 10,000 Republican votes, or a majority fraction thereof, polled at the preceding Presidential election. Senator Quay's object in presenting the resolution was to force the Southern delegates to support Roosevelt for Vice-President, and, after that was accomplished, he withdrew it.

If that rule had been adopted, the States would be represented in the National Convention this year as follows:

Republican States.	Delegates.
California	20
Connecticut	14
Delaware	6
Illinois	64
Indiana	38
Iowa	35
Kansas	23
Maine	11
Maryland	18
Massachusetts	28
Michigan	36

The Payne rule presents many advantages over the present system of representation to those who want to give greater power to Republican States in National Conventions. While the total number of delegates from the States is decreased from 952 to 903, the representation from Republican States is increased 76 delegates, and that from Democratic States is decreased 125 delegates.

Under the present system the percentage of influence exercised by the Republican States in National Conventions is 65.35. Under the Payne rule it would be 77.30, a gain of nearly 12 per cent. Combinations with Democratic States to control a National Convention could not, under such a rule, be made so easily. While the delegations from New York and Pennsylvania would be increased, these States, in a combination with the Democratic States and Territories, would lack 71 votes of the majority they can control under the present system.

The rule suggested by Postmaster-General Payne, however, is objectionable for the reason that, under its provisions, no uniform system can be prescribed for the election of delegates from districts. The Republican States, which would have more delegates than Representative Districts, could assign one or two to each district; but the Democratic States, with few exceptions, would have fewer delegates than districts, and they would have to elect all their national delegates at State Conventions. This would be unsatisfactory, as it would give leaders greater power in dictating the election of National delegates by State Conventions which they dominated.

Another plan has been suggested, which seems to meet the objections to the Payne rule, while it brings about the results sought by those opposed to the present system. It provides that States which cast their electoral votes for the Republican national candidates shall be entitled to send to the next National Convention four delegates-at-large and two delegates from each Representative District, as at present, and that Democratic States shall be entitled to send two delegates-at-large and one from each Representative District.

Representation in the Republican Na-

tional Convention this year, under this plan, would be as follows:

Republican States.	Delegates.
California	20
Connecticut	14
Delaware	6
Illinois	54
Indiana	30
Iowa	26
Kansas	20
Maine	12
Maryland	16
Massachusetts	32
Michigan	28
Minnesota	22
Nebraska	16
New Hampshire	8
New Jersey	24
New York	78
North Dakota	8
Ohio	46
Oregon	8
Pennsylvania	68
Rhode Island	8
South Dakota	8
Utah	6
Vermont	8
Washington	10
West Virginia	14
Wisconsin	26
Wyoming	6
Total	622

Democratic States.	Delegates.
Alabama	11
Arkansas	9
Colorado	5
Florida	5
Georgia	13
Idaho	3
Kentucky	13
Louisiana	9
Mississippi	10
Missouri	18
Montana	3
Nevada	3
North Carolina	12
South Carolina	9
Tennessee	12
Texas	18
Virginia	12
Total	165

The plan would decrease the total number of delegates from 952 to 787, but the Republican States would increase their strength from 65.35 to 79.04 per cent., and the representation from Democratic States would be reduced from 34.65 to 20.96 per cent. Delegates from Republican States would represent an average of 9,421 voters each, as at present, and those from Democratic States would each represent 8,240 voters, or twice as many as under the present system.

It is urged that the plan would be an incentive to Republican leaders in close States to make a greater effort to obtain a majority for the Republican ticket at Presidential elections and secure for their States double the representation in National Conventions that would be allowed if their States went Democratic.

Any change in the method of representation will have to be adopted by a majority of the delegates in a National Convention, and would not go into effect until the National Convention next succeeding.

The leaders from the Republican States could count on enough votes in the coming National Convention to adopt either of the plans. Under the Payne rule seventeen Republican States would have increased representation; four Republican States (Maine, Massachusetts, Rhode Island and Wyoming) would have fewer delegates than they have at present, and the representation from eight States would remain as it is. The seventeen States that would be benefited by the adoption of the Payne rule have 482 delegates, eleven less than a majority in the next National Convention. This deficiency, however, could be made up from the 82 delegates of the eight Republican States whose representation would not be changed, but whose percentage of strength would be increased by reason of the reduction in the total number of delegates. The vote for the change might be further reinforced by the twelve delegates from Idaho and Montana, the only two States in the Democratic column whose representation would be increased by the Payne rule.

The second plan—to leave the representation from Republican States as at present and to divide in half the representation from Democratic States—would probably find greater favor with the delegates from the stalwart Republican States. Debatable States, like New York, might oppose the plan, in order to avoid having their representation reduced one-half in the event of their failing to return a Republican majority at a Presidential election. If the opposition were confined to such States along with the Democratic States and Territories, it would not be sufficient to prevent the adoption of the plan in the next National Convention.

PHILADELPHIA, PA.

BEEKMAN WINTHROP

BEEKMAN WINTHROP, Judge of the Court of First Instance of the Philippine Islands, and the coming successor of William H. Hunt as Governor of Porto Rico, is peculiarly fitted for the position for which he has been selected by President Roosevelt.

He is about thirty-six years of age, a graduate of Harvard and an all around example of energetic American manhood. He comes from a distinguished family of New York, and his wealth precludes any necessity which might constrain him to devote his time to Government occupation; but his natural tendency is toward the sort of work to which he has fallen heir during his service in the Philippines. From the beginning he has made it a work of conspicuous merit.

He is a personal friend of President Roosevelt—a man molded after the heart of tne Chief Executive, energetic to the highest point of safety to health. From the time of his appointment as assistant executive secretary in the office of the Governor at Manila he was one of the hardest working officials of the Government service there, and he made for himself friends in every branch of the service and among the natives. The Filipinos prize him as a true friend, and as a man who will go to any amount of labor to effect a benefit for them.

Prior to his appointment as Judge of the Court of First Instance he was the working power in the office, which he had made a perfect machine for the transaction of such business as it was called upon to do; and for several months, during the absence of Secretary Fergusson, he served with distinguished efficiency as Secretary of the Commission.

In appearance he is tall and spare; he has brown eyes and wears a drooping brown mustache. His manner is cordial, and is always informed with a latent energy, which has not worn off by a residence of several years in the enervating climate of the Philippines His experience there has been valuable to him, and will be put to good use when he assumes the office of Governor of Porto Rico on the first of July. He loves the work of developing the resources of a people, and has proved that he is capable of large accomplishment under such an inspiration. His appointment is considered one of the most advantageous among territorial selections which President Roosevelt has made during his tenure of office.

The Mower

BY BENJAMIN B. WARFIELD

A MOWER went forth to mow,
And crooned his workman's song:—
"Swing, swing, O mower, thy goodly scythe,
Make the swath both wide and long."

Gayly the grasses grow,
And fling their heads in pride:—
"Swing, swing, O mower, thy goodly scythe,
Make the swath both long and wide."

Quiet they lie behind,
Each by its neighbor's side:—
"Swing, swing, O mower, thy goodly scythe,
Make the swath both long and wide."

Though every spear of them all
Be a man in right or in wrong:—
"Swing, swing, O mower, thy goodly scythe,
Make the swath both wide and long."

PRINCETON, N. J.

Fires in Roman Theaters

BY PROFESSOR RODOLFO LANCIANI

[Professor Lanciani is known as the foremost living authority on the antiquities and topography of ancient Rome.—EDITOR.]

AT the time of its greater prosperity—viz., in the second half of the second century of our era—Rome boasted of three theaters, two amphitheaters, two circuses, one odeum, and one stadium, besides other spectacular places of less importance, which were to be found in the villas and parks of Domitian, Gallienus, Maxentius, and even in those of private citizens.

According to the "Official Bulletin of the Empire," of which we possess two editions, the first dating from A. D. 334, the second from A. D. 357, these buildings were capable of accommodating the following number of spectators:

The Flavian Amphitheater	87,000
The Theater of Balbus	11,510
The Theater of Pompey	17,580
The Theater of Marcellus	20,500
The Odeum of Domitian	11,600
The Stadium of Severus Alexander	30,088
The Circus Maximus	385,000
Total	562,000

Perhaps there is a slight exaggeration in these figures; in fact, Professor Huelson has shown, by careful computation of all available space, that scarcely 250,000 persons could find room in the Circus Maximus. Whether he is right or not the fact remains that in comparison with such enormous capacities the largest of our modern theaters, auditorium, aquariums and concert palaces sink into insignificance. A question, to which a recent appalling catastrophe gives actuality and interest, is, were the Roman spectacular buildings absolutely fire proof? And in case they were not, what precautions were taken by the Roman police to keep under control, to protect, and to save those great crowds from destruction, in case of a sudden outburst of fire?

As to the first question, I do not hesitate to say that ancient theaters and amphitheaters were not fire proof. When we find ourselves in the presence of their mighty ruins, when we behold those great masses of marble and stone, that seem to defy eternity itself, we feel ready to scorn the idea that fire could destroy or damage or even simply scorch them, and yet fire has done all these things, however difficult we find it to explain the occurrence.

On August 23d, A. D. 217, Macrinus being Emperor, the Flavian Amphitheater (the Coliseum) was struck by lightning and set ablaze. The forty-nine companies of Roman firemen, helped by the detachments of marines from the naval

stations of Misenum and Ravenna, which happened to be quartered in Rome at that time, and with aid of a water spout, did not gain control of the flames until the stone and marble work of the upper tiers had suffered great damage, so great, indeed, that the amphitheater was altogether abandoned for the time being, and the celebration of the gladiatorial games was transferred to the Circus Maximus. Heliogabalus began, and Severus Alexander finished, the work of reconstruction in 223; it took, therefore, six full years to make the damage good. The repairs made by these two Emperors can be seen to the present day, from the upper balcony, consisting of a patchwork of stones of every description, trunks of columns, pieces of entablatures, lintels and architraves, recovered from the portions damaged by fire, or taken away from other buildings. The hasty reconstruction of this higher belt is shown by the irregularity of the joints of the blocks, and also by the fact that the composite pilasters are not all straight, or placed in the same perpendicular as the Corinthian columns below. This with regard to the Coliseum.

The Amphitheater of Marcellus, the colossal remains of which form a hill called Monte Savello, from the patrician family of that name, which fortified it in the Middle Ages, was burnt twice; the first time in the fire of Nero, July, 65, A. D.; the second in the fire of Titus, A. D. 81. Worse, even, was the fate of that of Pompey the Great, which was gutted not less than four times in the space of 337 years. The first conflagration, which took place A. D. 22, was so destructive, especially on the side of the stage (*scena*) that the work of restoration, undertaken by Tiberius, and continued by Caligula, was only finished at the time of Claudius (A. D. 41-45). The unlucky building was again damaged by fire in the year 80 under Titus, in 249 under Decius, and in 283 under Carinus.

As regards the Circus Maximus, we know that the great fire of Nero, which destroyed half the city in July, 65, A. D., originated from the inflammable materials accumulated under the arcades of the building. The damage was so considerable that in order to save time and money, and to avoid the tedious work of quarrying millions of cubic feet of stone, the Naumachia of Domitian was demolished, and its stone and marble blocks made use of in the reconstruction of the arcades of the Circus.

These instances, and many others which I could quote, show that the spectacular buildings of ancient Rome were not safe from fire; but how can we reconcile this idea with the fact that the remains of these buildings, which still tower to a prodigious hight, were but a mass of solid masonry and of solid stone?

Let me answer first as regards the Coliseum. In the year 80, A. D., when the building was declared ready for use, the imperial Delegates, Liberius Maximus and Thyrsus, assigned certain spaces and sitting accommodation to the various orders of citizens, corporations, religious brotherhoods, representatives of the army and navy, foreign Ambassadors, magistrates, and so forth. One of these assignations of places has come down in the official records of the Brotherhood of the Arvales. In this precious document, which has been illustrated from every point of view by Huebner, Mommsen, Huelsen and myself, we find the following passage:

"And, furthermore, we assign to the Arvales in the uppermost eleven rows of *wooden* steps or seats, section fifty-third, the space of 63 feet, eleven-twelfths, and one-twenty-fourth (63 feet + $^{11}/_{12}$ + $^{1}/_{24}$)."

We learn from this passage that the last and highest eleven rows of seats in the Coliseum were of wood (*tabulationes*), their aggregate length being 18,480 feet, and their framework strong enough to support a crowd of 13,860 spectators; we may compute the approximate quantity of timber accumulated on the top of the amphitheater at one hundred to one hundred and fifty thousand cubic feet; a prodigious mass of fuel, made more inflammable by the fierce heat of a Roman summer (the burning took place on August 23d). Summer electrical storms of Rome are generally accompanied by a powerful wind, which must have fanned the flames, and soon reduced the whole tabulations to a mass of embers.

As regards the theaters we are sure of one point, that the fire always broke out from the stage, destroying it, but doing very little damage to the rest of the stage building. The stage is expressly mentioned by Dion Cassius *à propos* of this burning of Pompey's Theater, A. D. 22, and again by the biographer of the Emperor Carinus in connection with the disaster of the year 283. On this last occasion the stage was encumbered with all kinds of inflammable material and tinsel, for the performance of a spectacular pantomime. The Romans were exceedingly fond of this kind of show, and the *mise en scène* of popular pieces was such an elaborate display of ingenuity, magnificence and study of details that all our present attempts lose in comparison. The few details that have reached us on the subject sound like fairy tales. The day in which King Tiridates of Armenia was invited by Nero to witness the performance from the imperial box, the whole Theater of Pompey, stage, seats, boxes and balconies, was gilded for the occasion; the awnings spread over the *cavea* to protect the spectators from the sun were made of Tyrian purple, dotted with stars of gold, with the image of the Emperor woven or embroidered in the center under the attributes of the sun guiding the chariot. This extravagant display was long perpetuated in the folklore, under the name of "The Golden Day." In the hunting exhibitions given by Philip the Arab on the occasion of the secular games, the following varieties of wild beasts were introduced into the arena, and slain by hunters from the sun-scorched wildernesses of Arabia, Nubia and Mauritania, or from the snow-clad mountains of the Hyperborean regions: 32 elephants, 10 elk, 10 tigers (which were almost a novelty to the Romans), 60 tame lions, 30 tame leopards, 10 hyenas, a hippopotamus, a rhinoceros, 10 archoleontes (it is unknown what they were), 10 camelopards, 20 zebras, 40 wild horses, and an immense number of less rare animals.

On these occasions the air was kept cool by the sprays of many fountains and refreshed with the grateful scent of aromas. The arena—that is to say, the stage of the amphitheater—was made to assume various aspects, according to the kind and place of origin of the wild beasts which were to be hunted to death. At one moment the arena would be shaded by the palms and tamarisks of the sandy wastes, and at another it would be broken into the rocks and icy caverns of Thrace; and when amphibious animals, hippopotamuses or alligators or other monsters of the deep, were made to appear, what had just before seemed a garden or forest was suddenly converted into a pond, surrounded by lotus plants and other Nubian reeds. The poet Calpurnius, who describes the games of Nero, assuming the character of a shepherd, attracted to the Capital by the fame of their magnificence, affirms that the nets, which were to protect the spectators from the inrush of the wild beasts, were of gold wire, and that the belts (or corridors) which divided the several ranks of spectators from each other, were studded with cut glass in imitation of jewels.

The amphitheater erected by Scribonius Curio for the celebration of his father's funeral games, in 46, B. C., was essentially a double theater—that is to say, was composed of two semicircular theaters placed on pivots and rollers, so that when the dramatic performances were over on either stage, they would be made to revolve, without the spectators leaving their seats, and be brought face to face, thus forming an amphitheater for the shows of gladiators and wild beasts.

It is easy to imagine what great masses of people gathered on these occasions to witness such extraordinary celebrations, and how difficult was the task imposed on the Roman police to keep the crowd in order, and marshal the various classes of citizens to the seats or spaces allotted to each of them. For this purpose the theaters and amphitheaters were provided with an outer fence or palisade, and a double control established—one at the gates of this outer fence, at which the holders of tickets were admitted in a general way, another at the various doors or arches of the building itself, where the numbers of the section, of the upper or middle rows, and of the steps and the seats marked on the ticket were verified. The duty of preserving order inside the building was assigned to special attendants, under the

ontrol of a managing officer, called *vilicus amphitheatri.* The Coliseum alone was provided with 64 *vomitoria* (a very appropriate name for the exit doors), and the entrances, passages and staircases were contrived with such exquisite skill that each individual, whether senator or plebeian, could reach his own allotted seat without trouble or confusion. This is, perhaps, the reason why no record exists of loss of life in Roman theaters, in consequence of panic or fire; and the reason is evident. Before the flames could get hold of the inflammable parts of the structure the crowd had had ample time to retire through the numberless "vomitories" and absolutely fire proof staircases.

The only instance of a catastrophe, in comparison with which the modern or latest ones of the Ring Theater, of the Cannebière at Marseilles, of the Opéra Comique, and of the Iroquois, pass almost into a secondary place, in which panic caused more loss of life than the actual collapse of the building, is to be found in Book iv, ch. 62 of the "Annals" of Tacitus. This grave historian relates that in the year 27, A. D., a certain Atilius, a man sprung from the lowest classes of the city, obtained from the Emperor Tiberius the permission of raising a temporary wooden amphitheater, at the fifth mile stone of the Via Salaria, against the cliffs of the ancient city of Fidenæ, now called Villa Spada. As under the rule of Tiberius athletic and gladiatorial shows had become quite a rare event on account of the indifference, akin to repulsion, which that Prince felt toward them, an enormous crowd of citizens met at Fidenæ, attracted by the novelty of the exhibition, and by the charms of an excursion up the green valley of the Tiber. These spectators had hardly taken their seats on the wooden steps when a considerable section of the structure gave way, with a terrific crash, burying under the heavy masses of timber a part of the assembly, while the other part was being crushed to death in frantic efforts to escape. Tacitus, who must have gathered his information from the official reports of the police, states that the number of the killed, wounded and maimed was 50,000. The Capital was struck with terror; noblemen turned their palaces into hospitals; matrons and maidens of the Patriciate took the office of nurses. "We had an example in those eventful days," says the historian, "of the good old times when after a hard fought battle the town was turned into one family, the able portion of which gave up all their time and care to the disabled." The city magistrates, of course, made new and stringent regulations to insure the safety of public places of entertainment; generous subscriptions came to the relief of the sufferers, and—to make comparisons with modern cases more perfect—just as the author of the Marseilles catastrophe was only fined a few hundred francs, so Atilius, the author of the Fidenæ slaughter, was only banished from the Peninsula.

ROME, ITALY.

"Perchance to Dream"

BY ROSAMOND MARRIOTT WATSON

THE dead man turned in his narrow bed,
"Sweet is the breath of the Spring," he said;
"I know the grass on the hills grows green
Where cowslips flower between."

Lulled by the birds and the soft Spring rain
The dead man turned to his dreams again.
"Oh! those I knew in the wakeful years,
Naught I ask of their smiles or tears;
Some heed not, and the rest forget,
But the Spring remembers yet."

LONDON, ENGLAND.

My First Greenhouse

BY FRANKLIN DAVIS

I HAD the misfortune some years ago to break down, and last spring our city home had the good luck to break up—we sold it. Consequently, the approaching winter presented a peculiarly dreary prospect as it drew near, for where and how was I going to get through it? I could go nowhere—alone—and the different members of my family had somehow grown tired of going South or to Europe to kill time with one who had every appearance of being in good health and should be able to do things by himself. For a few years now I have been spending more and more time in the gardens about our summer home in Connecticut, among the roses, grapevines and melons. The interest in growing and blooming things had increased with each season, and my success has been great enough even mildly to interest our family circle.

The idea that all this suggested I had been nourishing for months, but it did not mature till the September frosts ripened it, and even then it was with considerable hesitation that I announced one evening that I was thinking of building a small greenhouse and spending the winter in the country with it as a companion and plaything. At once there were objections from all sides. You cannot afford it, you will die of the blues, you will tire of it by Christmas, you will freeze to death here in a house with French doors and windows and cold bedrooms, and all alone with the servants. These were only a few of the obstacles presented by the wise ones. When I declared that I was not thinking of building on our own place, but on another's land, three miles away, I was pronounced crazy. But I knew from experience of a certain south room in a household that was always sunny, no matter which way the wind blew or how cold it was, and where dogs and horses were part of the family, and "Smith" the cob, and "Bob" the setter, and I would be comfortable and well cared for there. Then, too, there is a certain small vein of self-will running all through our family that only needs opposition to turn it into an artery of determination; so I went ahead and interviewed the carpenter, who was more sympathetic. We drew our plans on the smooth side of a pine board. "I want it cheap, but substantial, and put up at once," and with this as a corner-stone the work began.

The first result noticed was that I began at once to drive the three miles to P——— and back every day to watch the work, entirely alone, a thing my nerves had not allowed for years, for now I had a living interest in something besides myself. A few weeks later "Smith," "Bob" and I had moved over for the winter. The last light of glass was in place, the door shut, the fire lighted and work had begun.

The building was 33 feet long and 15 feet wide, with an even span roof 8 feet high in the middle and 4 feet on the side running north and south, and altogether quite a comfortable establishment to my proprietary eyes. It was divided into three compartments. At the north end was the potting shed—I began at once to enjoy the technical terms—8 feet long, with shingled roof, one-half of which was dug out 4 feet deep for the boiler, and the other half with a bench for potting and a cupboard for the new set of carpenter's tools, some of which were needed almost every day. Next came the greenhouse proper, 25 feet in length, with glass roof, and divided by a glass partition into two equal compartments; the one next the potting shed to be kept at a night temperature of 56 degrees for roses and the other at 50 degrees for carnations. Then about the sides and through the middle of each room were raised benches, upon which was placed the earth for the growing plants, or pots containing them. I

Corner in the Greenhouse

may as well mention at once that here was one of the mistakes already made. The benches were nailed tight against the house, thus effectually preventing a good circulation of the hot air coming from the hot water pipes beneath, and causing several degrees difference in the temperature between the front and back of the benches. This was not only in itself detrimental to even and satisfactory growth of the plants, but it allowed the ice to remain on the lower portion of the roof till late in the day, shutting out an abundance of sunshine. Then, too, all the framework of the roof was constructed of too heavy material, making the house dark during the short winter days, to say nothing of the extra cost. The carpenter followed out my directions about making the house substantial better than he did about making it cheap. The entire cost of the building, including the heating apparatus, was $425, but I won't say how much all the plants, pots and other fixings cost, lest my thrifty brother should read and find fault.

Now for what was grown. Fortunately, within walking distance lived a gardener out of employment, who was more than willing to help me with the harder part of the work, and, what was of much more consequence, with his advice. This I have supplemented by reading everything obtainable on the subject of raising flowers indoors. Where most gardeners begin the year in June by planting the benches with roses and carnations, so that they may get well established and in bloom by fall, I did not start anything till the first of November; so I was decidedly handicapped by this as well as by my faulty building. Then, too, the soil I used was any old stuff scraped together from garden and barnyard, instead of the usual compost of sods and manure that had been mellowing for six months. By a generous use of postage stamps and the telephone plants began to arrive—some good, tho small, and some large and distinctly bad; but the new boiler gave them a warm welcome, and things began to look businesslike. In the rose house are 60 roses—Bride, Bridesmaid, Golden Gate and La France—that have given a constantly increasing number of blooms since February; 8 tomatoes that by April 1st had grown to the ridge and were full of blossoms and yellowing fruit; 6 large heliotropes that have been sweet for months, and a bank of geraniums, arbutilous and salvia that have flowered amazingly all winter in pots. Besides there have been 6 large pots of fuchsias, 4 cyclamens, 4 dozen hyacinths, 1 dozen cinerarias, 3 callas, 3 bouvardias, 6 Easter lillies and some begonias that have all helped to make the room bright in proper succession. In the other half of the house are 60 carnations, Lona, Morning Glory, Lawson, Enchantress, Maceo, Crane, Eldorado and Ethel Crocker. Some of these have done well, while others have not been worth the space they have taken up. I imagine I overwatered and syringed them during the short days of winter, altho about half the plants were very scrubby to begin with. A line of primroses in pots has been a mass of flowers all winter; a few square feet of mignonette has grown giant stalks, and a little larger space has kept us supplied with lettuce. A lot of 50 California violets that had been frozen by mistake out of doors we brought in as an experiment and watered and watched for weeks, and were about to throw out in disgust when they suddenly began to bloom and then were well worth while. Some lilies of the valley, which we dug up from our garden, froze, and then started under the benches, grew leaves principally, while a box of 100 German pips I bought forced in three weeks into a mass of splendid spikes. A mushroom bed we carefully prepared under one of the benches has been an absolute and dismal failure. Finally, I have now filling all the corners of the greenhouse and a fine new cold frame running the width of the south end of the greenhouse hundreds of carnations, geraniums, roses, salvias, pansies, verbenas, etc., etc., in pots and flats that we have raised from our own cuttings or from seeds for out of doors this summer and inside next winter. The weather all winter has been bitterly cold, and instead of the estimated five tons of coal, I have shoveled nearly seven into the furnace.

And the fun of it all! Care, work, uncertainty, hope, realization and disappointment came and went with almost every hour and made each day different from its predecessor, tho, of course, there was more or less of a general routine to follow. At 6 o'clock in the morning James, the farm foreman, shook down the fire

The Greenhouse

and added enough coal to burn till I had finished my 8 o'clock breakfast, and then with my morning cigar I made an interesting call on each individual plant. Black, the gardener, appeared about 10, and then we did the necessary watering and sowed seeds, struck cuttings, repotted plants and rearranged things generally, sifted the ashes and had just time to sweep up when it was time to go in for dinner. In the early afternoon I would go sleighing, very often to one of the grand private greenhouses in the vicinity, with their roses and carnations and palms, to say nothing of grapes and all sorts of fruit trees, each in its own glass and iron mansion, and an army of trained men to look out for them. Indeed, the care is so effectual that the owners don't dare to pick even a rose or handle a cluster of grapes without permission.

There are no rules about my little house and no signs but "Welcome," and there are always some flowers for the visitor to pick. "Bob" has knocked down many a pot under the benches with his tail, but the door always opens at his scratch. About 4 o'clock I would start up the fire for the night, and as the cold came down with the evening, the three men from the farm, having finished their early milking, came in for a pipe and a talk before supper. Finally, at 9 or 10 o'clock in the evening I go out to bank the fire for the night. In a little diary I have kept a record of the weather inside and out, and just what I have done each day, and I know this will be a great help another year. Having done most of the work myself and helped at everything, I feel competent to run the house alone from now on. But already there are conferences with the carpenter—this time one with a more moderate amount of lumber at his disposal—and I imagine there will be work enough for two all the time next year.

Well, my little winter garden has not made money, and, in fact, it has cost considerably more than it should, but it has been a constant and increasing pleasure to me; it has brought me better health than I have had these ten years, and, best of all, I have solved the question as to "Where shall I spend the winter?"

CONNECTICUT.

The New Galveston

BY W. B. SLOSSON

ON Saturday, September 8th, 1900, the world was startled by the news that a "West India hurricane," originating in the vicinity of Martinique five days before, had entered the Gulf of Mexico blowing at the velocity of 120 miles an hour, and in a night the wind and waves had destroyed 6,800 of the inhabitants of Galveston and more than $18,000,000 of property, including 4,131 homes entirely demolished or washed away.

The next morning Galveston exhibited an appalling condition. It was then true to its name of the "Island City," for it was completely cut off from the world. The only approaches to the city, the three railroad bridges and the county bridge for wagons and foot passengers built across the bay, here two miles wide, were gone. Ships had been blown from their moorings and driven through these bridges, one ship being blown across to the main land. All telegraph and telephone wires were gone, and the people of the beautiful city were cut off from the world.

Her people had at once thrust upon them the duty of burying their dead, rescuing the living and guarding the property that was left from the ghouls, which appear like vultures on the scene of any great disaster to prey upon the helpless and the dead. The citizens at once organized military companies to patrol the streets while the law was paralyzed, and played the parts of both judge and executioner on the miscreants caught robbing the houses and the corpses. Within twenty-four hours communication was established with the outside world by wire and boat. Expressions of sympathy and substantial aid flowed in from all parts of the world, and the people met their changed conditions as brave Texans.

There was no time lost; it was not possible to hesitate. The citizens of the

Bird's-Eye View of East End of Galveston City

South Jetty, Looking from Sealy Hospital

ruined city had to make instantly the most important decision in its history. It required but one meeting of the business men and prominent citizens to determine finally these three things: that they would rebuild their city on the same site, that they would render it forever safe from similar disaster, that they would pay for this themselves. This last resolve was a necessary consequence of the other two, for the financial credit of both the city and county of Galveston was buried in the water which had overwhelmed so many thousands of its people and their homes. Nobody had faith in the city but its citizens. It was thought by the outside world that the disaster had proved that a city on such a low lying island, exposed to all the fury of the Gulf storms, could never be made safe. It was not realized that the hurricane was of so exceptional a character that any seaport town would have suffered almost as much. Galveston had been settled ever since 1837, and the "Pirates' Island," notorious as the refuge of Jean La Fitte, had been known ever since the Louisiana Purchase, but it had never been covered with water as it was this time.

But, more to restore confidence than because they considered it necessary, the people determined on two measures which will rank among the most important engineering feats of the country, the building of a great sea wall and the raising of the grade of the city.

The wall will be a little over three miles in length, sixteen feet wide at the base, five feet wide on the top and seventeen feet high above mean low tide. There is also an apron twenty-seven feet wide by about four feet thick extending seaward in front of the wall, composed of solid granite, as a further protection in case of storms and to shield the wall against undercurrents. The wall was built on piling driven 45 feet into the clay close together, imbedded in 4 feet of cement at the top.

The wall proper is composed of concrete made of crushed granite from

Sea Wall, Top View, Showing Angle in Wall Now Occupied by the Railroad Tracks. This will be filled in even with the top of wall and boulevard

Granite Mountain, Texas; sand from San Jacinto River, cement from Germany, and artesian water from Alta Loma—all thoroughly mixed by machinery constructed especially for the purpose, and to give additional strength immense steel rods nine feet in length are placed in the wall every three feet as the wall goes up. To complete this immense structure were required 7,500 carloads of concrete, 5,000 carloads of riprap, 2,500 carloads of sand, 1,350 carloads of cement, 18,000 round piling, 4,000,000 feet sheet piling, and 10 carloads of reinforcing rods; total carloads, 18,110. This equals one carload of 40,000 pounds, or twenty tons, to every foot of completed wall. This great work, now nearing completion, has been constructed at the rate of about 100 feet per day.

Before this immense work could be started the money must be provided and arranged for at once. The "Wall Streets" of New York and other cities poured out money without stint in the name of humanity when the fearful story of the storm and its consequent suffering was wired around the world, but the bonds of Galveston city or county would not then have been listed "on 'change" at any price. The business men of Galveston took in the situation, asked of the Legislature authority for the county to issue $1,500,000 of 4 per cent. 40-year bonds, resolved to take the bonds themselves *and did so.* It took nerve and patriotism, coupled with city and State pride, after the terrible experiences so recent to subscribe and pay for a million and a half of their own bonds with which to do this immense work, but the wealthy men and women of Galveston were equal to the emergency. I know of one business man of Galveston who had lost by the storm more than $50,000 and by the depreciation of property more than $50,000 more, yet he subscribed and paid for as the work progressed $50,000 of these 40-year bonds. Not only the wealthy (for before this calamity Galveston was known as the most wealthy city of its size in America), but the laboring men and women, working girls, and even children, became imbued with the same civic spirit and helped with their mites to build the "sea wall." To own a "sea wall bond" was their highest ambition.

The world helps those who help them-

selves, and it is not a wonder that, displaying such a spirit of self-help, this people has in a little over three years reestablished their credit, rebuilt their beautiful city, and the record of the year's business of export for 1903 over the Galveston wharves shows a 40 per cent. increase over that of any previous year.

The law under which this issue of $1,500,000 of bonds was made provides for a levy of fifty cents on the $100 of property. The first levy was made at the time of the issue of the bonds, and in less than eight months from date of issue practically every cent was paid, and four per cent. of the entire issue of bonds was retired and canceled. Citizens paid their sea wall assessments whether they paid any other tax or not. Before this Congress adjourned a bill was passed by which the Government will extend the sea wall past the forts on the Island, making about 6 miles in all.

The second stupendous work of raising the grade of the city was also undertaken and is now being carried out. On the side of the bay, looking toward the mainland, where formerly the buildings almost touched the water, the grade will be raised to eight feet above mean low tide. On the opposite side toward the Gulf it will reach to the top of the sea wall, seventeen feet high, giving a slope to the city grade of one foot in 1,500 feet. The area raised is from Thirty-ninth Street on the west, east along Broadway past Thirteenth Street, and south and west to the sea wall on the Gulf. A novel plan of construction is in use for raising the level. To quote from the report of County Commissioner Henderson:

"The material is to be taken from the bay and between the Government jetties by self-loading and discharging and self-propelling dredges, which will steam from the excavating ground through a distributing canal to pipe line stations, and then discharge their loads through pipes running down the streets and avenues. The contractors are to move the houses from the canal route to sites provided, rent free, by the city, and later return them to their original locations. The city leases the lots from property owners, paying as rental all taxes for the period covered by the lease."

The contract was let by the grade raising board to a New York firm on the basis of 18½ cents a cubic yard for filling in place. The total cost will be $2,080,-

East End of Galveston Island, Showing Sea Wall and Grade Raising Completed; South Jetty and Steamers in Galveston Bay in the Distance

745, and it is to be completed in three years.

The Twenty-seventh Legislature of Texas authorized the issuance of $2,000,000 of four per cent. bonds, and also remitted all taxes for the period of 17 years. This tax fund is to pay the interest on the bonds and also to provide a sinking fund to pay the bonds at maturity.

The total cost of building the sea wall and grade raising will amount to $3,500,000; the interest and principal are already provided for, and with a less bonded indebtedness than voluntarily assumed for improvements by most cities of the Union of the same population as Galveston.

In connection with these novel feats of engineering there has developed a new form of municipal administration which in its way is probably of quite as great importance and interest to other cities. The five men who as City Commissioners have handled so ably the affairs of the city and redeemed it financially are Judge Wm. A. Austin, Messrs. H. C. Lang, D. E. Austin, I. H. Kempner and A. A. Norman. These trained business men at a personal sacrifice of time have developed the efficiency of the "commission idea" in municipal government as compared with the election of a city council by wards better, perhaps, than in any other city of the Union.

Meeting each Tuesday evening, they give an hour or more each week in passing upon measures for the advancement of the city in a brief, businesslike manner truly refreshing. These five men arrive at precisely 6 o'clock at the City Hall. Judge Austin, seated at the end of the table, says: "Gentlemen, what have we before us to-day? The clerk will read." Then is passed upon the policy of the city pertaining to the great improvements being made running up into the millions, the granting of franchises, street paving and the various requirements of the city government. More actual business is transacted in an hour than by many a city council in half a day. No politics, no ward or boundary lines considered, only the building up of their beautiful city and the greatest good to the greatest number.

Here is the recorded result of the last two years' work in one direction by this Board of Commissioners. The city is doing business on a cash basis, and the debt of the city of Galveston reduced from $204,074.54, according to the auditor's report January 1st, 1901, to a debt of only $22,000 January 1st, 1904, and this without the issuance of a bond or one cent of additional taxation. Is it any wonder that Galveston has already firmly established her credit?

Col. R. M. Johnson, of the *Houston Post*, said editorially March 12th, 1904:

"It is inevitable that the splendid showing made in Galveston will do much to strengthen the belief that the application of the 'commission idea' in municipal government may in time result in conditions which are little short of ideal."

In the near future it is planned more closely to connect the island with the main land by constructing across the bay a giant causeway two miles long and 500 feet wide, with a drawbridge in the center, which shall be a bridge for the four railroads now entering the city, for wagons and for foot passengers, and also for the electric Houston-Galveston Interurban Railway, which has secured the franchises to connect the two cities fifty miles apart.

The jetties being built by the United States Government secure a minimum depth of 27 feet of water in the channel, which will soon be increased to 30 feet. The docks are but an hour's run from the deep sea. The wharfage capacity is unlimited, but there are now equipped with every modern convenience six miles of frontage which will accommodate 91 large ocean-going vessels simultaneously. This is in the United States second only to the port of New York. The value of exports to foreign countries for 1903 was $50,412,520 greater than for any preceding year. The export of cotton showed an increase for 1903 of $59,304,609 over 1902. The export of grain and flour for 1903 shows an increase of more than 40 per cent. over any previous year.

Galveston's bank clearances for 1903 showed an increase of $50,728,000 over 1902, or $389,104,000 for 1903. There were expended for new buildings during 1903 $828,000, more than equaling any previous year of its growth.

The National Government has ex-

pended at Galveston to make a deep water port for the northwest over $8,000,000, and has later appropriated $1,300,000 to make a channel 25 feet deep and 150 feet wide from the Galveston jetties to the city of Houston, 50 miles inland. Galveston now boasts of having 53 foreign and 10 domestic lines of steamers, not counting tramp ships, going from her port to all parts of the world.

The Panama Canal, when completed, is expected to add 50 per cent. to the present import and export trade of Galveston, and will benefit Texas probably more than any other State of the Union.

To-day Galveston smiles to the world rehabilitated. It is a new city that bids for the traffic of the world, and its brave people are determined to make of it one of the greatest seaports of the world.

HOUSTON, TEXAS

The Adventure of the Seventh Sardine

BEING A HITHERTO UNPUBLISHED ADVENTURE OF YALELOCK CHROMES, ESQ.

BY HENRY G. DODGE

CHAIRMAN OF THE EDITORIAL BOARD OF THE YALE RECORD

CHAPTER I.

I FOUND Chromes lying curled up on the stove as I entered.

"Pardon the *bizarrerie* of my position, my dear Swats'em," he said, as he descended to greet me, "but I find that gentle heat is a great aid to deduction, and I am on a case—Ah, Swats'em, what a case! Never since '96, the year that I captured the Strabismic Greengrocer and exposed the Pickle Fraud, have my powers been so sorely tested. But why are you here? Your train leaves—"

"Heavens, man!" I cried, aghast, "how do you know that I was on my way to the train?"

Yalelock smiled. "My dear boy, that trunk on your shoulder tells me that you are either going traveling or riding on the cars, and, besides, you have on a clean collar, and 'tis only Friday."

"Ah, but tell me where I am going?" I asked, dazed by his marvelous powers.

"Why," he returned, quizzically, "you have been married this evening and you and your bride are going to the lakes for a fishing trip. The first point I gathered from the white ribbon bow about your traveling cap, and, as for the second, what are you doing with that rod and creel in your hip pocket?"

I started, involuntarily, dropping the trunk in my admiration. "My dear fellow, you are truly wonderful," I stammered.

"Nonsense," said Chromes, quickly. "But come, I need you to-night. There is hard work ahead and you must stay by me."

My heart leaped at the prospect of a case with Chromes, and throwing off my coat and *sang froid,* I settled into an armchair. My friend dropped on the floor beside me, and tossing the khiva carpet over his back to keep warm, took a letter from his pocket. "Swats'em," he said, with a Turkish (sh)rug of his shoulders, "little would you think that this could have endangered a man's life, yet such is the case. Look—" and opening the envelope he drew out—a sardine!

I shrank back horror-stricken, but Yalelock calmly continued.

"A few moments before you came in I received a visit from Lord Blitherscut. You remember meeting him, Swats'em, when we were on the case of the Speckled Bandanna. It seems that a week before his brother had received a similar missive, and the next day his trunkless body was found, head downward, in the umbrella-stand in the front hall. Since then his wife, two sons, the coachman and his favorite riding horse, 'Dobbin,' have all been the recipients of these terrible epistles, and in every case their bodies have been found in the same spot, mutilated in the same horrible way. Unless I can invent some clue, either Lord

Blitherscut's body or mine will be found to-morrow in the umbrella-stand at Scutley Manor."

Yalelock ceased and sat gazing hopelessly at the sardine. Suddenly he sprang to his feet.

"Look!" he cried, and pointed to a small card, which we had overlooked, tied to the sardine's tail. He carried his prize to the table, and there, in the glare from the radium (he always kept an ounce handy for lighting purposes) he read from the card the one word: "Puzooni!"

Instinctively he paled.

"I know that man!" he hissed. "He keeps a grocery store down by the river. We will bag him to-night, Swats'em, you and I. I shall disguise myself—let me see,—ah, as a banana! He will never suspect."

Chromes turned to the cellaret and was deftly flavoring his favorite laudanum cocktail with a sprinkle of muriatic acid and the squeezing of an opium cherry when a shot rang out and the glass was shivered in his hand. "Ah!" he remarked, naïvely, removing an olive which had imbedded itself in his cheek, and gazing out with the air of a connoisseur, "that shot was fired from a Martini. Puzooni is watching us. Let us go."

CHAPTER II.

Chromes and I slid softly down the banisters and out through the street door, where his two velocipedes awaited us. We mounted and pedalled swiftly into the darkness, my friend enjoining absolute silence upon me, and keeping himself a sharp lookout for Puzooni or any of his accomplices who might be dogging our footsteps.

For seven miles we sped on, side by side, when, on a sudden, Chromes rang his bell violently as a signal for me to keep quiet. I looked ahead and there in the glare of a street lamp I saw a muffled figure crouching behind the curb not six feet in front of us. Instantly we stopped and consulted. The man was not yet aware of our presence. With a finger to his lips, Chromes took from his pocket his portable telephone, attached it to his handlebars, and rang up Scotland Yard.

I waited, my forehead bathed in perspiration and every nerve in my body quivering with terror. Everything depended on our getting Scotland Yard. What if the wireless should be down! The very thought of it froze the blood in my veins.

After what seemed centuries of waiting, Yalelock turned to me, the receiver still to his ear, and said, fighting back his emotion, "Swats'em, have you a nickel?"

The horror of it all came over me in a second. "Ye Gods! I have no money!" I cried, brokenly.

Chromes hung up the receiver and his face went white. He sat for a moment as if turned to stone, his head sunk upon his breast, when, without a moment's warning, he sprang from his velocipede.

"The last resort!" he cried, and vanished into the darkness.

Hardly had I recovered from my surprise when, happening to look down, I saw on the pavement between the crouching figure and myself—a banana! An exclamation of admiration escaped me, but the next moment it froze to a groan on my lips, for the man had seen me and was advancing, knife in hand, in my direction.

On he came, his black eyes snapping with hatred, while I sat rooted to my saddle. Suddenly he threw his arms wildly into the air and fell to the ground with a shriek. He had slipped on the banana peel! There was a short struggle, but before I could dismount and reach the spot, all was over. The culprit lay upon the ground, his hands manacled and his feet tied. Yalelock, in his shirt sleeves, stood over him, his pale, handsome face illumined by the soft lamplight, and in his hand he clutched—a box of sardines.

"Puzooni!" I cried instantly.

"The same," Yalelock returned, calmly lighting one of his "El Fumo" cigarets. "That was a happy thought of mine, to slip off my coat. Anything good at the theaters to-night, Swats'em? We're in time for the last act."

New Haven, Conn.

Literature

Walpole Re-edited

ALL things taken into consideration Walpole's Letters* must be reckoned the most interesting and the most important in the English language. To find anything comparable to them for fullness of information and brilliancy of style one must go to the great French writers—to Mme. de Sévigné, whose letters were admired only this side adoration by Walpole and imitated in their buoyant lightness, however much their exquisite sentiment escaped him; or to the Journal of St. Simon, whose picture of court life was in Walpole's mind when writing his record of society to Horace Mann, altho here again he lacks somewhat the completeness and finish of his original.

It is, perhaps, first of all as to a kind of privileged historiographer of the eighteenth century that we go to Walpole. At times his letters flow into a narrative of almost epic consequence, as, for example, those that relate the desperate struggle and final defeat of his father, Sir Robert Walpole, after the twenty years' dictatorship of that first of British premiers. For those interested in the growth of political institutions the Letters have this supreme value, that they display in full detail the complicated process by which the Government passed from the hands of the king and his favorites into a Cabinet representing the predominant national opinion. And it is needless to say that those whose chief interest is in personal anecdotes and the pageantry of events may here feed their appetite until satiated. It would not, for example, be easy to find a more graphic account of a state function than this story of the funeral ceremony of George II, in which the imbecility of his natural son, the Duke of Cumberland, and of his ancient servant in Parliament, the Duke of Newcastle, are set forth with delightful malice by a hostile observer:

"When we came to the chapel of Henry the Seventh, all solemnity and decorum ceased—no order was observed, people sat or stood where they could or would, the yeomen of the guard were crying out for help, oppressed by the immense weight of the coffin; the Bishop read sadly, and blundered in the prayers. . . . The real serious part was the figure of the Duke of Cumberland, hightened by a thousand melancholy circumstances. He had a dark brown adonis [wig], and a cloak of black cloth, with a train of five yards. Attending the funeral of a father, how little reason so ever he had to love him, could not be pleasant. His leg extremely bad, yet forced to stand upon it near two hours; his face bloated and distorted with his late paralytic stroke, which has affected, too, one of his eyes, and placed over the mouth of the vault, into which, in all probability, he must himself descend—think how unpleasant a situation! He bore it all with a firm and unaffected countenance. This grave scene was fully contrasted by the burlesque Duke of Newcastle. He fell into a fit of crying the moment he came into the chapel, and flung himself back in a stall, the Archbishop hovering over him with a smelling bottle—but in two minutes his curiosity got the better of his hyprocrisy, and he ran about the chapel with his glass to spy who was or was not there, spying with one hand and mopping his eyes with the other. Then returned the fear of catching cold, and the Duke of Cumberland, who was sinking with heat, felt himself weighed down, and, turning round, found it was the Duke of Newcastle standing upon his train to avoid the chill of the marble."

That is a striking bit of high comedy, taken by itself, but for its full effect it should be read in its place at the close of the fourth volume after the characters of the actors have been graved in the mind by a thousand minute strokes.

Valuable as the Letters are as historical documents, they are even more important as a comment on English literature. In an early letter Walpole avers that all Englishmen are mad, and certainly the strange and motley procession of grotesques and eccentrics that pass through his pages would lead one to

* THE LETTERS OF HORACE WALPOLE. *In Sixteen Volumes, Chronologically Arranged and Edited with Notes and Indices by Mrs. Paget Toynbee.* Vols. I to IV. New York: The Oxford University Press.

admit the charge. It is scarcely possible in any other way than by a perusal of Walpole to acquire a comprehension of the "humors" that make up so large a part of English literature, from Ben Jonson through Fielding and Smollett and Scott down to Dickens. It is the England of Shakespeare's gravedigger, vastly entertaining, altho, at times, a trifle disconcerting: "'Twill not be seen in him there; there the men are as mad as he."

Only a word need be said of Mrs. Toynbee's new edition of the correspondence; her work is excellent in every respect. The letters are now first arranged in strictly chronological order, and a good deal of new material is added. In every case where it was possible the text has been collated with the original MSS., and many errors corrected. The notes are brief but adequate. The volumes, which proceed from the Clarendon Press, are models of neat elegance.

The Evolution of Theology in the Greek Philosophers

WHILE the Scotchman has ever inclined to philosophy, philopsophy seems to run especially in the Caird family. John Caird, long known as Principal Caird, formerly discussed philosophy and religion at Glasgow University, and now Edward Caird, formerly professor of moral philosophy in the same university, and at present Master of Balliol, after the production of several works on philosophy, especially in its bearing on theology and religion, has just given to the public an important work,* the substance of which he delivered as Gifford Lectures at the University of Glasgow in 1900-01 and 1901-02.

The fact that this matter was delivered as a series of lectures does not preclude its being a thorough work, inasmuch as it has been worked over for publication in its present form.

This book is not easy reading that any man can dash off at a rapid rate. But having once begun, one is held to the end. But if one read only the first two chapters, *The Relation of Religion to Theology,* and *Stages in the Evolution of Theology,* one would be greatly rewarded.

At the very outset clear distinctions preclude confusion:

> "Theology is not religion; it as at best the philosophy of religion, the reflective reproduction and explanation of it, and, as such, it is the product of a time that has outgrown simple faith and begun to feel the necessity of understanding what it believes."

Then the old schism between faith and reason is handled. The author refuses to take sides in a quarrel where "we have, on the one side, a faith that withdraws itself from criticism by raising a plea against the competence of the critic, and, on the other, a reason which treats faith as another name for illusion."

To be sure, he admits a sort of justice in the attitude of both parties, saying:

> "A faith which is not seeking intelligence is a faith that is stunted and perverted; . . . the attempt to defend Christianity by questioning the right of the intelligence to criticise it, is suicidal." But, says the author, "On the other hand, it seems difficult to admit the claim of science at all without making it so absolute as to leave no room for faith." He then proceeds to put the dilemma as sharply as possible: "On the other hand, it seems as if religious faith must seek reason as a condition of its own life, and yet that in seeking reason, it seeks its own destruction;" when lo! he finds a way of escape, "But I think that there is already in our hands, in the idea of Evolution, a kind of Eirenicon, or means of bringing the opposing sides nearer to an understanding with each other . . . to break off the horns of the dilemma of which we have been speaking—a dilemma which really arises from their being sharply and abstractly opposed to each other." . . . "Their difference and opposition, however far it may reach, must ultimately be conceived as secondary and capable of being explained from their unity. Their conflict, in short, must be taken as analogous to the conflict of different members of forms of vital activity in one organism, a competition which in the healthy organism is always subordinated to co-operation, or at least only ceases to be co-operation at a lower stage that it may become co-operation at a higher. It is thus that in organic evolution greater differentiation of function proves itself to be the means to a deeper integration and more concentrated unity." So "we must maintain that,

* THE EVOLUTION OF THEOLOGY IN THE GREEK PHILOSOPHERS. *By Edward Caird, Master of Balliol College, Oxford.* 2 vols. Pp. 382 and 377. Glasgow: James Maclehose & Sons. New York: Macmillan & Co. 1904.

tho reason may accidentally become opposed to faith, its ultimate and healthy action must preserve for us, or restore to us, all that is valuable in faith."

This is the idea so beautifully expressed by Tennyson in his lines:

"Let knowledge grow from more to more;
But more of reverence in us dwell;
Till mind and heart, according well,
May make one music as before
But vaster."

In the chapter on *The Precursors of Plato* is drawn a picture of the great amount of thinking that was done in the Greek world before we come to Plato and Aristotle; and trivial as much it now seems, it prepared the way for the great philosophers. There were heroes before Agamemnon.

The author follows with some success the tangled thread along which Plato worked his way to great light and to the idea of God, becoming the greatest Greek theologian. And we must not forget that our author, as the title of his book suggests, is concerned with theology rather than speculative philosophy.

That he is not merely a theologian but looks deeply into religion is seen not only from passages already quoted, but from the following:

"Theology is religion brought to self-consciousness;" "the religious consciousness, in its essential meaning, is the consciousness of a Being who embraces all our life and gives unity and direction to it, who lifts us above ourselves and binds our limited and transitory existence to the eternal."

"For religion does not affect merely one aspect of life or one department of things. A man's real religion, whatever he may profess, is the summed up product of all his experience, the ultimate attitude of his thought and feeling and will, into which he is thrown by his intercourse with the world."

A Great Municipal Reform

THE year 1902 witnessed, in accordance with the provisions of the new law passed at Albany April, 1901, the inauguration of one of the most important of recent municipal reforms, the Tenement House Department. The nature of the work and the achievements of this new department are revealed in two volumes,* edited by the first commissioner and his chief assistant. Notorious, indeed, as the housing conditions of New York were, their full extent was not known until this department took the matter in hand and revealed the fact that New York, "the City of Living Death," as it has been termed in this connection, stands alone in the disgraceful housing of its poorer classes.

Vivid is the account of the struggles of the department with the numberless perplexing questions before it. For the title given to the city is not a misnomer. A few figures indicate the difficulty of the undertaking. According to the statistics of 1900 there are in Greater New York 82,652 tenements, with a population of 2,372,079, more than two-thirds of the entire population. More than half of the houses and the population are in Manhattan. Owing mainly to the inrush of immigration the tenement population as well as tenement houses has been increasing steadily. A comparison with the statistics of 1865 shows that in forty years the tenement population in Manhattan has grown from 480,368 to 1,585,000, an increase of 229 per cent., while tenements have grown from 15,511 to 42,700, an increase of 175 per cent.

These figures, however, are significant only when they are taken in connection with the state of affairs they entail. One complicating circumstance is the quality of the population, mainly composed of poor foreigners, who are not only unable to maintain the American standard of living, but, indeed, have no desire to do so. Forced by the instinct of race association into certain districts, they have become dependent upon these districts, both materially and socially. This was naturally taken advantage of by the average landlord, moved by the pressure of competition to secure as much from his tenants and spend as little upon his house as possible. Very often his good intentions, when he had any, were hindered by the indifference and unresponsiveness of his tenants, too deeply sunk in the larger miseries of life to consider such minor details worthy of attention.

There is no need of repetition of tene-

* THE TENEMENT HOUSE PROBLEM. *By Various Writers. Including the Report of the New York State Tenement House Commission of 1900. Edited by Robt. W. De Forest and Lawrence Veiller.* New York: The Macmillan Company. 2 vols. $6.00.

ment evils, with which all readers of present-day newspapers and magazines are familiar—the "black-hole" rooms, the rickety fire-trap building, the incredible crowding of families and boarders in a few rooms, often used as workshop as well as for sleeping; the indescribable filth resulting from the unsanitary state of the most necessary house appurtenances, the danger to morals and health, and, as if the pot of trouble was not full to overflowing, the tenement house prostitute. All this has caused inconceivable vice and disease. Tuberculosis is so prevalent in tenement districts that whole blocks of them have come to be characterized as "tuberculosis blocks."

Toward the amelioration of these, in some respects unavoidable, evils, the department, under the guidance of Mr. De Forest, has done splendid and stable work. The prostitution evil has been almost completely wiped out. The law has been vigorously enforced, and, it is to be hoped, is but the first of a series in this most vital of municipal tasks.

Almost every aspect of the tenement house problem is discussed here with a thoroughness as practical as it is scientific. Conditions in New York are contrasted with those of other cities in the United States and Europe. The nature of the improvements of the new law, with respect to provisions for fire-escapes, back-to-back tenements, and general house sanitation, is exhaustively treated. Further reforms, such as the individual ownership of homes and the installation of parks, playgrounds and baths, wherever necessary, are described. A most valuable article by Miss Claghorn on the race elements and race changes in the tenements throws much light on the difficulties facing those who are working for the betterment of tenement-house dwellers.

Educational Theory

In these days of great expenditure of time and money upon education no one can question the value of interests that issue in books upon its various aspects. One may be pardoned, however, for thinking that the pressing need is for work in the science of education with a view of rationalizing the art, and that work in the history and philosophy of education should yield to scientific investigation. It is a thankless task, however, to quarrel with a man's selection of tasks. Furthermore, one reads with profit Professor Buchner's presentation of "Kant's Educational Theory" * The contents include an introduction giving the sources, basis and central conception of Kant's educational theory, a translation of Kant's "Lecture-Notes on Pedagogy," and also selections on education from Kant's other writings.

The "Notes on Pedagogy" are of more than historical interest. It cannot harm us to find how old are many of our most approved pedagogical maxims on the modernness of which we are wont to congratulate ourselves. In any case, Kant's emphasis upon the moral end in education and his insistence upon self-activity as the test of the truly educated man will probably always be in season. Best of all, perhaps, is the feeling that comes in reading the "Notes" of intimacy with the gentle conscientious old teacher of Königsberg. Here, at his desk, in the presence of his class, he appears in less awesome isolation than he does in his study, whence, later, issue the "Critiques."

Another writer on educational topics, Professor Horne, of Dartmouth College, gives us in a well systematized, comprehensive way the best thought of the day upon the general theory of educational practice.† Ease and clearness of style make the book very readable. It may well prove helpful to many. There is no attempt to make original contribution to the subject; rather, the purpose is, as it were, "to take stock." Investigators in the natural and mental sciences are, in turn, called upon to speak for the good of the order. One encounters all through the book familiar ideas. De Garmo and Dewey, Baldwin and James, and others of present-day renown meet us in their well-known togas.

In the case of disputed questions the writer advocates compromise or calls for further evidence. The treatment of biological problems that are basal to educational theory shows wholesome reserve.

* KANT'S EDUCATIONAL THEORY. *By E. F. Buchner, Ph.D. Lippincott Educational Series. Vol. IV.* Philadelphia and London: J. B. Lippincott Company. 1904.

† THE PHILOSOPHY OF EDUCATION. *By H. H. Horne, Ph.D.* New York: The Macmillan Company. $1.75 net.

Indeed, the tendency to premature generalization, so characteristic of most works on such topics, is noticeable only in spots.

In philosophy the author advocates idealistic theism, and would make the educational process issue by implication in such a philosophy, supporting his position by arguments that are akin to those set forth by such idealists as Royce. No more comfortable or inspiring doctrine for the teacher can be formulated, and it is well that it is often an article of the faith. Dr. Horne's arguments in its favor will strengthen those who are already of the household. More than that no writer on philosophical topics can hope to accomplish.

The Nile Quest. A Record of the Exploration of the Nile and Its Basin. By Sir Harry Johnston, G.C.M.G., K.C.B. New York: Frederick A. Stokes Co. $1.35 net.

Until the very close of the nineteenth century the Nile was clothed in mystery. If we begin to reckon only from the time of Herodotus, who visited Egypt in 457 B. C., and ascended to the First Cataract, we may say that the mighty stream, upon whose annually recurring flood the very life of a vast region depended, kept the secret of its origin for nearly 2400 years, in spite of periodic attempts to solve it. It is this long period and even centuries previous to it with which *"The Nile Quest"* deals, and a fascinating story it is. Sir Harry Johnston, probably best known in this country as the discoverer of that strange animal, the Okapi, himself an explorer of wide experience in this same Nile Basin, was a very suitable person to undertake the history of Nile Exploration. Thoroughly in sympathy with exploration and conversant with all its difficulties, he has, in the limited space at his disposal, faithfully assigned to each of the many who have taken part in the search for the Nile sources the credit due to them. If three names—Speke, Schweinfurth, Stanley—rise above all others, it is because their work is superlative. To Speke belongs the credit of discovering the immense reservoir of the Nile, the Victoria Nyanza; Schweinfurth explored the basin of the Bahr-al-Ghazal, an important tributary from the very heart of Africa; Stanley was the first to identify the almost mythical Mountains of the Moon and to discover Lake Albert Edward lying just before their feet. The discovery of the actual sources of the river was a comparatively easy matter after European nations had laid their hands upon the territory around them. These, of which there are two, supply the Victoria Nyanza through the River Kagera. The more important one, but not the one most distant from the mouth, rises in 3° south latitude, at an elevation of 6,270 feet, while the other, the one farthest south, rises in 3° 45′ south latitude, and at an elevation of 6,300 feet. Both are in close proximity to the headwaters of the Congo, the first named being only fifteen miles north, and the second only ten miles east, of Lake Tanganyika. *"The Nile Quest"* forms the first of a series to be called "The Story of Exploration," and from the list of works given as "in preparation," few series could be of greater interest. This volume is profusely illustrated with portraits, scenes and sketch-maps, in addition to which there are two excellent maps giving the orographical and land-surface features of the whole Nile Basin.

Henry J. Wood. By Rosa Newmarch. London and New York: John Lane. $1.00.

This little book, the first it is announced of a series dealing with the "Living Masters of Music," is a frankly eulogistic account of the development and achievements of the young English orchestral conductor who made a flying visit to these shores last January to preside over a concert by the New York Philharmonic Society. In spite of a tendency to pad out her essay with digressions mainly for the sake of fine writing, the author, with a refreshing enthusiasm that is almost naïve, succeeds in setting before the reader a lifelike portrait of the god of her idolatry and in arousing interest in the story of Mr. Wood's successful efforts to make good music popular in London. Interesting, too, is the account of the man as a teacher of singing and a leader of choruses. The course of Mr. Wood's development as an interpretive conductor, says the author, "has been, as it were, inverted," for his first triumphs were with Wagner and Tschaikowsky, and he is now working his way back to

Beethoven and Mozart. "But altho his sympathies are undoubtedly maturing to include works that at first failed to rouse all his enthusiasm, he remains in his musical outlook essentially a modern of the moderns." Of special interest to American readers just now is this conductor's attitude toward the music of Richard Strauss. The author says:

"With the works of Richard Strauss Henry J. Wood seems to sympathize almost as closely and comprehendingly as with those of Tschaikowsky. When he returned from Amsterdam overflowing with enthusiasm for *Ein Heldenleben* and the rest, one felt sure that this complete assimilation of the Strauss genius would reveal itself before long in some wonderfully vivid and convincing performances of the tone-poems. He never wavered from the first in his estimation of these latest examples of the modern spirit. He had faith in them and insight into their profound psychological significance."

The little volume as a whole admirably sustains the author's final contention that "Henry J. Wood is a democratic force in music. His greatest service to his art and his country lies undoubtedly in the fact that he has liberated music from its exclusive sphere and offered it to the people."

Literary Notes

"Surgical Chiropody," by Dr. Charles O. Kahler, is a well illustrated little volume containing clear and concise directions for the care of the feet and the treatment of their maladies.

....The first number of "The American Journal of Religious Psychology and Education" has just been published by Clark University. The application of the inductive methods of the new psychology to the interpretation of religious history and personal experience has already thrown a new light on many old problems, and such a journal as this for the collection and publication of the important but very desultory and fragmentary literature of the subject is needed. The article which just now will attract most attention is a psychological study, by President G. Stanley Hall, on "The Jesus of History and of the Passion versus the Jesus of the Resurrection."

....The twenty-five cent reprints of first-class novels by the Macmillan Company are very handy for summer reading. It is much better to lay in a supply of vacation fiction from such a series than to take new novels, because they are sure to be worth reading. The list includes "The Virginian," by Owen Wister; "Calumet K," by Merwin Webster; "The Choir Invisible," by James Lane Allen; "The Heart of Rome," by Marion Crawford; "The Conqueror," by Gertrude Atherton; "The Pride of Jennico," by Edgerton Castle, and "The Crisis," by Winston Churchill.

Pebbles

"You heard the story of the overripe banana?" "No." "It's too good to keep."—*University of Pennsylvania Punch Bowl.*

....A Harvard professor, dining at the Parker House, ordered a bottle of hock, saying: "Here, waiter, bring me a bottle of hock, —hic, haec, hoc!" The waiter, who had been to college, smiled, but never stirred. "What are you standing there for?" exclaimed the professor. "Didn't I order some hock?" "Yes, sir," replied the waiter. "You ordered it, but afterward declined it."—*The Classical Review.*

A CATECHISM OF CIVICS.

What are the principal products of the United States?

Historical novels and health foods.

Does the climate vary much in different parts?

Yes.

What is considered to be the hottest region of the country?

Zion City.

And the coldest?

John D. Rockefeller's safe deposit vault.

What common product is raised in the same proportion all over the country?

Babies.

What are these babies used for?

In the South to run the factories. In the North to furnish new educational systems

What are the principal industries of the inhabitants of the United States?

They grow trusts, buy stocks on a margin and manufacture South American revolutions.

How is the Trust crop grown?

By magnates and the common people.

What is a magnate?

Almost any dishonest man who has money enough to keep out of jail.

What are the principal trades of the United States?

Operating for appendicitis, writing advertisement poetry and going out on a strike.

What is the total population?

About seventy millions.

How are these divided?

Into females and Presidential candidates.

What is the color line?

An imaginary line drawn from Tuskegee Institute to the White House dining room.

—*American Journal of Economics.*

Editorials

Disarmament

LAST week we referred to the Mohonk Arbitration Conference. Pursuing the same line of thought, we suggest the following ideas on the relation of disarmament to treaties of arbitration and the union of all nations: It seems most desirable that their true relation be understood, as considerable confusion of thought on the subject was manifested at Lake Mohonk and seems to be general. It was apparent at The Hague Conference and is manifested at every assembly where these questions are discussed.

Called primarily for the purpose of inducing the nations to agree to a limitation of armaments, The Hague Conference adjourned without any agreement to this effect. But it provided for a political union of all nations except those of Central and South America, and suggested the execution of general arbitration treaties.

A little reflection will show that this was the best step toward disarmament. There is a law of political development, namely, compound political bodies follow in the path previously marked out by the individuals or units composing them. Therefore the history of disarmament of individuals composing a State and of States composing a union of States will give the cue to disarmament of nations.

Each State in our Union has a right to forbid the carrying of weapons, but no State can enforce such a prohibition except in proportion as the people become willing to go unarmed. Up to the present time the best a State can do is to forbid the carrying of *concealed* weapons. But organizing the State and gradually increasing its authority has brought us to this point of individual disarmament.

Passing from individual to State armament, we find that when our American Union was first organized each State retained the right to maintain an army and navy, granting to the United States in Congress assembled the right to determine the size of the army and navy of each State. Coupled with this agreement was another, namely, that all the States should come to each other's assistance in any conflict with a foreign Power. So that each State felt, and, in fact, was, more secure after surrendering its right to determine the size of its military establishment. And it will be found that this right is renounced only when greater security is obtained by the renunciation than was enjoyed under the system of unrestricted right of armament. The *quid pro quo* is very closely scrutinized. Take, for instance, the change made in this respect when the present Constitution displaced the Articles of Confederation. Each of the States gave up the right to maintain an army or navy, delegating this right to the Union. The Union bound itself to *preserve forever each of the States from foreign aggression and from internal disorder.* In addition to this guarantee the States reserved the right to keep and drill a militia, and to name the officers of the militia, even when employed in the service of the United States, and, furthermore, the United States was forbidden to infringe the *right of the people to keep and bear arms.* So that in the formation of our Union individual disarmament is left forever in the hands of each State, and State disarmament went through two stages: First, the Congress of the United States was empowered to place limitation on the armament of each State, and, second, State armament was abolished and national armament took its place.

It is easy to see that the nations will be slower than our States were to surrender the right to determine what size army and navy are necessary for their security. Before the nations could agree to leave to the Union of Nations the fixing of the military status of each nation the feeble Union of Nations, embodied in The Hague Court, would have to be enlarged by the addition of a Legislative Department, and this World's Congress would have to acquire greater power and prestige than our Congress had under the Articles of Confederation. But when

this universal political organism is perfectly formed, and has attained its full growth, and won the entire confidence of the nations, this state of mind will be a greater security than immense navies, and then the navies of the nations will vanish from the seas, leaving them beautified by ships of commerce sailing in perfect safety to the haven where they would be, unmenaced by the monsters of war. In the meantime something can be done toward disarmament by the execution of arbitration treaties, for their execution decreases apprehended danger, and hence makes it possible to decrease preparation to meet danger.

When Chile and the Argentine entered into a treaty of arbitration they agreed to sell warships then in course of construction, and also that neither of them should increase their naval expenditures for five years without notice to the other. These two nations felt greater danger from each other than from the rest of the world; hence their treaty enabled them to decrease their armament. The situation of European nations is somewhat different, and a number of arbitration treaties would have to be executed to justify similar action on their part, but disarmament to some extent can follow on the execution of arbitration treaties and may reasonably be counted on.

The Situation in Colorado

For the appalling crime committed at the Independence railway station in Colorado on the 6th, when fifteen innocent workmen were blown to pieces, there can be no excuse. Those who did the dreadful work, those who planned it, and those who incited the men who were directly guilty, deserve to be detested by mankind. If all or any of them can be found, they should suffer the extreme punishment of the law. As to this, good men and all who prefer civilization to barbarism must agree. General Bell asserts that he has evidence sufficient to convict forty of the union men now in custody. It should be made known and used without delay.

When we consider the history of this labor war in Colorado, however, and the origin of the dispute which has been so emphasized by this crime, and also the methods used by the Government of Colorado in dealing with it, we cannot find that the blame for all the disorder and injustice that have marked the controversy should rest exclusively upon one party or the other. It should be remembered that the will of the majority in Colorado has been thwarted to the injury of many employed in the industries connected with mining. An eight-hour law was passed for their benefit. The Supreme Court of the State decided that it was at variance with the Constitution. Whereupon the workmen and those who agreed with them undertook to amend the Constitution, and were successful. Their amendment, permitting and even requiring the enactment of an eight-hour law, was adopted by a majority of nearly 47,000, a large one in a State where the total vote for President in 1900 was only 220,000. A Legislature pledged, and in duty bound, to enact a law in accord with the amendment was elected. It did not enact one. Various explanations are given. One of them is that the desired legislation was prevented by a lobby in which the powerful mining and smelting interests of Colorado were represented. We do not assume that this is necessarily the correct one. It may be. At all events, the law required by the amendment and by a majority of 47,000 voters was not passed. The workingmen were cheated. But, of course, corruption or stupidity in a Legislature is no excuse for crimes of violence.

Thereafter, as a rule, we understand, the eight-hour day prevailed in the mines, but was not accepted in the smelting works. To obtain eight hours from the smelters a strike took place; to assist the striking employees of the smelters a strike was ordered in the mines, unwisely and unjustly, as it seems to us. That was in August last. The mine-owners, resenting this action by men whose demands they had granted, and naturally desiring to work their mines, began to employ such non-union men as they could find. Two weeks ago many of them had all they could use. But their success excited the anger of the unionists on strike. Organized mine-workers in our mountain States are inclined to use force without scruple to accomplish their ends, when they are in difficulties. The annals of Cœur d'Alene and some

other places testify to that. Certain mining camps in Colorado have recently been little short of hells on earth owing to this contest of desperate strikers with the men who have taken their places and with the employers whom they deserted. Nothing else can account for the extraordinary attitude of the other residents of these towns toward the unionists. But the failure of the Legislature to enact a law was no excuse for the misconduct and lawlessness of the men who have come to be so heartily hated by their fellow-citizens. Those who were aggrieved should have sought a remedy at the ballot-box or in the courts or by other methods of civilized procedure.

On the other hand, it seems to us that there has been much in the action of the State authorities which is at variance with the rules of civilization. Force has been used without dignity and sometimes without justice or decency. The use of force was undoubtedly required, but it was possible so to employ it that the course of the authorities would inspire and deserve the respect of disinterested and civilized persons in other States. The acts of the Governor and his officers have too often suggested despotism and tyranny. We have been accustomed to think of Colorado as a State in which intelligence and a due regard for the settled procedure of law have displaced the lawlessness of the frontier. This wholesale herding of men in "bull pens," in many instances merely on suspicion, this deportation of citizens without a hearing to desolate regions in adjoining States—these are practices of which a proud and intelligent Commonwealth should be ashamed. Does Colorado confess that she has no courts in which these 75 or even 200 suspected men can be tried? And the local organizations of citizens that are assisting in these deportations, that have in the recent past deported many residents without the aid of troops, and that are now proscribing any man who belongs to a labor union in any industry—is not their tyranny as great as that of the miners' union itself?

Residents of Colorado who resent the criticism to which the State has been subjected say that lawlessness has been found in only a few places and that a great majority of the people uphold the Government in attempts to repress it. There is all the more reason, then, for the use of legal and civilized methods in the work of repression and punishment. A Government that relies with confidence upon the support of a vast majority of the governed is not compelled to resort to proscription and the methods of despotism. It can find a legal remedy for violence and crime without escorting into the desert a hundred men who are suspected of misconduct and to whom a hearing has been denied. The exigencies of the situation do not require the Commonwealth to vie with the accused in promoting injustice. Wrong doing should be sternly repressed, the innocent should be protected, and the guilty should be made to pay the just penalty for their offenses, but the work should be done decently and in order.

The Evolution of the Home

When Mrs. Gilman published a few months ago her original and suggestive book on "The Home" we called attention to the fact that it was much stronger on the destructive than the constructive side. Her trenchant wit cut away much of the ivy which adorned and concealed this time-honored institution, so all could see its defects considered from an industrial and economic standpoint. Its incongruous collocation of amateur handicrafts certainly looks very much out of date in comparison with the efficient methods of wholesale production to be seen now almost everywhere else, and it is obvious that the process which has been for a hundred years taking one industry after another from the home to the factory is not yet at an end. Undoubtedly in the future many of those functions which we now commonly regard as essential factors of "the home" will be assumed by outside agencies, tho as to the rapidity and the extent of such a change there is room for much difference of opinion.

But it is one thing to recognize the inadequacies and defects of an established institution and quite another and a much more difficult task to devise a better. Mrs. Gilman, unlike too many reformers, is not, however, merely, or

even primarily, an iconoclast. She does not shirk the harder edificatory task, and she responded willingly to our request that she outline for the readers of THE INDEPENDENT her idea of a practicable substitute for the existing *menage*, whose deficiencies she has so sharply pointed out. The first article of the series appears on page 1359 of this number.

In these contributions to the science of domestic economics Mrs. Gilman is not imagining a Utopia. She is planning an American city home, not a castle in Spain. The model city block as she describes it, with its single kitchen and laundry, its courtyard and roof-garden, its *creche* and kindergarten, is, in her opinion, a practical financial proposition at the present time, under prevailing social conditions, and not requiring any change in human nature.

It is, we believe, worthy of serious consideration, and we propose to set our readers a good example by criticising it seriously. To take up one point, where it seems to us the calculation is at fault, the large item of the raw materials of food can be, according to Mrs. Gilman, reduced from $4 a week per capita to $2 by expert buying in quantity. Both these figures are, in our opinion, altogether too low and their ratio is incorrect.

We happen to know that actual cost of uncooked food in a restaurant for working girls in this city averaged very nearly $3 a week. The buyer was a woman of unusual efficiency, the *chef* higher paid than in Mrs. Gilman's estimate, and both exerted themselves to keep down expenses as low as possible. The restaurant was started from philanthropic motives and the aim was merely to pay expenses, which it barely does. The food, altho much superior to that sold in other restaurants, is, of course, not nearly so expensive as that demanded by a family, such as that assumed in the article, with an income of $5,000 a year.

Let us take another example, that of a large dormitory in connection with a woman's college of this city. Here $4.50 is charged for board, and the food alone costs $3.50. This is an especially interesting case, for the institution is under the supervision of a school of domestic science and the dietary carefully studied to secure the largest number of calories of potential energy and a correct ratio of fats, proteids and carbohydrates at the lowest cost. That is, it represents the best results attainable by the application of such principles of dietetic science as are yet known by those who are personally interested in its success. The cooks were expert and well paid. The standard of living was not much above the grumbling level. To fed the same number of men the expense would be greater. The restaurant gives 30,000 meals a month, and in the dormitory there are 150 to 200 individuals, so the conditions are much the same as those used as a basis in the article.

The cost of the food in private families is more difficult to estimate. From casual observation of some 50 cases, where the income is under $2,000, we find that the cost of the raw materials for the kitchen is between $2.25 and $2.50. The woman from whom we obtained the figures for the domitory given above had been for eight years the housekeeper and buyer for a private family, and she states emphatically that there is no economy in buying, cooking and serving of food on a large scale over the ordinary household methods. Her practical experience, combined with her study as a professor of domestic science, gives her opinion a considerable value. So we are forced to conclude that $2 a week will not buy in a large city sufficient food to satisfy persons used to the standard of life implied by a $5,000 income, and that it is not proved that by substituting wholesale methods for "the hopelessly extravagant individual buyer" the food bill could be "easily reduced by half and give better food." Without waiting for the complete community home, there are many who would be glad to give up home cooking if warm and well cooked meals could be delivered to their homes at a price not much greater than they now pay, but tho this has been often proposed and sometimes undertaken, it has not proved successful.

Obviously the challenging of this single item in Mrs. Gilman's estimates does not affect the general argument. It is too attractive a scheme to be dismissed from the mind without an effort to determine what features, if any, are impracticable about it, and how they, if it is possible, may be eliminated.

The Restless Age

An eminently practical writer of the first Christian century once suggested to a friend of his that it was not worth while to kick against the pricks. This bit of philosophy is accepted by practical men wherever we find them. They realize that some things in this queer world of ours have to be taken as they are, and they lose patience with the too visionary reformer, who fails to distinguish between the possible and the impossible.

A recent critic of present social conditions has been complaining that this is a "restless" age. He says that men, and women, too, go wandering to and fro. No one is satisfied to "stay put" in that "station in life" to which he was born. Every one seeks larger opportunities, or, at any rate, new ones. Humdrum occupations have become irksome. The boys leave the farm; the girls must go to college; women graduates must plunge into settlement work and elevate the slums. Instead of marrying and bearing children they must become nurses, teachers, doctors, or "club women." They want "rights," and a vote. Moving from place to place, in search of better business chances, or social position, or excitement, married couples no longer care to be bothered with children. Children are a care; they get in the way, and they cost a great deal of money. All social relations, including marriage, are disintegrating. All the good old standards are forgotten.

There is some truth in all this grumbling, and some of the facts are regrettable, but the indictment, as a whole, is undiscriminating. The new conditions are not all to be deplored, and some things that we do not like cannot be helped. It is wiser to try patiently to work out the new ethics of the new social order than to tear our shoes against the pricks.

This is a "restless" age, and why? Because, in the first place, it is an age in which a marvelous economic prosperity has created an astounding concentration of population. Altho birth rates are diminishing throughout the civilized world, the death rates are falling even more rapidly, and the multiplication of human beings since the beginning of the nineteenth century has been, as the English statistician Longstaff remarks, "A phenomenon absolutely unique in history." Industrial evolution, which has made it possible for a relatively small part of the population to supply food and raw material to a relatively large part, has stimulated the growth of great cities and manufacturing towns. Steam and electricity have made possible a mobility of human beings and a development of communication among them not less amazing than the growth of population itself.

Now, mobility and communication are necessarily disintegrating. In modern society they are combined with a multiplication of opportunities. One immediate consequence is that while great urban aggregations of population continually grow larger, the individuals composing them are continually arriving and departing. Like the throng at a World's Fair, which remains from day to day a throng, tho its individuals come and go, the modern city is a total of ever shifting elements.

It follows that each individual is brought into touch directly or indirectly with thousands of other individuals and with a myriad disturbing influences. That he should be "restless" is inevitable. That he should be contented is impossible. The rural household a hundred years ago was contented, because it had to be. Its acquaintances composed a narrow circle rarely penetrated by the "outsider." News of the wider world reached it tardily, as faint echoes from a distance. All social relations remained stable because they were untouched by disrupting forces.

We live, then, in a "restless" age because of mobility, of communication, of infinitely varied opportunity, of contact of mind with mind. These conditions have come to stay. We shall not go back to the age of the narrow and sheltered life, of humdrum and stupidity. Efforts to create social stability in the sense of unchanging individual relations are foredoomed to fail. All that we can hope to accomplish is to convert mere restlessness into systematized and progressive activity.

And this is possible because the human mind has a power to choose. New impressions, new opportunities, happily

do create dissatisfaction with conditions that admit of being bettered. It does not follow that we must yield to every new suggestion. The modern man must learn to compare and to discriminate. He must discover that while he is no longer bound to "stay put" while the world moves on or to be contented where improvement is possible, he is bound to change for the better and not for the mere sake of change.

All this means that the world to-day calls for a new moral education. The injunction to refrain from this and from that no longer serves its purpose. In a society where every influence impels to experimental action the voice that merely says, "Thou shalt not," falls on unheeding ears. The moral education that would avail must set up ideals of attainment. It must picture forth a life appealing to reason and all the higher sentiments of the soul, and must help reasonable men and women to choose those courses that lead to its realization.

The Utilization of Suicides

JUNE is the favorite month for suicides, and, therefore, the most suitable time for the discussion of this growing evil, which the forces of governmental and ecclesiastical laws and of public opprobrium have not availed to check. All such prohibitive and deterrent measures should be continued and strengthened, but since there is no reason to think that they will be any more successful in the immediate future than they have been in the recent past it is well to consider if there is not some way in which the disposition to suicide can be utilized for the benefit of the community.

As it is now the annual loss to the country from this cause is appalling. Without attempting to calculate the incalculable injury to the feelings of relatives and friends and the indirect injury to society, it is sufficient to realize that according to the ordinary valuation of a human life established by railroads and courts, that of $5,000, the direct monetary loss from the 8,597 suicides in 1903 is nearly $43,000,000. This is, of course, too low, since many suicides are not reported to the papers or pass as accidents, since both the victim and his friends usually prefer to give the death that appearance whenever possible.

Now, it is not to be supposed that a man contemplating suicide would be deterred by the consideration that the community which has reared and educated him has a right to his life services, but there must be many, determined to die, who would prefer a useful and glorious death to a useless and disgraceful one. Why not, then, call to the attention of those contemplating suicide the many ways by which they can accomplish their purpose to the advantage of their fellow men? A suicide is commonly considered something of a coward, but by a very slight change in the manner of his death he would be accounted a hero. Surely an actor would prefer to leave the stage with the sound of applause, instead of hisses, ringing in his ears.

Such ways are so numerous and obvious that it is only necessary to call attention to a few of them as examples. The most familiar is service in war. The present conflict in Manchuria makes more apparent than ever before the immense value to a nation of men who are literally fearless. The ordinary soldier, regular or volunteer, however brave and patriotic he may be, has a natural preference to spend his pension himself rather than to have it endow his widow; so, while he will obey orders, he is unwilling to take unnecessary risks. Think what a commander could do in the way of manning submarines, placing mines, blocking harbors, dropping bombs upon the enemy from balloons, and dynamiting fortifications if he had at his disposal a company of men really anxious to sacrifice themselves. There are emergencies when one such man is equal to a thousand common soldiers; so if the United States possessed a hundred of them it would double the efficiency of its present maximum army of 100,000 at no additional expense. This would be possible if only one out of a hundred of those determined to commit suicide could be induced to join such a company. Such a Morituri Corps, composed of the bravest of the brave, would naturally enjoy the highest honors during life, and afterward rank with such immortals as Arnold von Winkelried, Horatius Cocles, and Leonidas. Curtius may have been a very ordinary man, but

by his willingness to throw himself into the gulf which yawned in the Forum he became the greatest treasure Rome possessed.

Peace has need of more such heroes than war. It is a shame to send a man who loves life and has a family to disarm a maniac running amuck, or to carry explosives from a burning building, when a few blocks away a man tired of life is holding a pistol to his head. It would be merely common sense to have attached to each police station and fire department a few men for extra hazardous service—men whose conscience revolts against self-slaughter, but who, nevertheless, are in such desperation that they will violate their own moral law and that of the community because they know of no other way of meeting death.

The arts and manufactures are necessarily carried on with loss of lives, and as far as possible there should be willing sacrifices. Pure and applied science would be rapidly advanced if men tired of life would volunteer in its service. Aeronautics will only become practicable at the cost of hundreds of lives. There are undoubtedly some among the thousands of new compounds invented every year by chemists which would be of value as medicines if they could be tested. The knowledge that mosquitoes carry the germs of malaria and yellow fever, gained by the willing sacrifice of a few lives, has saved hundreds in the past few years. There are many explosives known which would be useful if the method of their safe preparation and preservation were worked out. Inoculation with new antitoxins and difficult surgical operations can now be tried only on animals, with uncertain results, or on patients so far gone with the disease that recovery is practically impossible. In exploration in the tropics and at the poles a few absolutely intrepid and desperate men could accomplish marvels.

It may be objected that suicides are so cowardly or unreasonable that they would not volunteer for such social service, but this is not so certain as some may think. Only one-tenth of the suicides are reported as due to insanity, and the cowardice in some cases is of as peculiar a nature as that Maupassant analyzes in his story of "The Coward," who shot himself because he was afraid of being killed in a duel. A man who is afflicted with an incurable disease might welcome a painless surgical operation which would shorten his life. The desperate lover should remember that nothing would make his disdainful inamorata feel so repentant in after years as to compare her prosaic and unheroic husband with the world-renowned hero and savior of his country whom she once contemptuously rejected.

Most suicides are probably due to disgrace or too little appreciation; the loss of one's self-esteem through the discovery of the lack of esteem on the part of others. The victim is led by the sense of a wounded reputation to the belief, not altogether false, that his life is forfeit to the community through his fault or crime. Now a man whose life is a failure who has committed an offense against society, for which he cannot make reparation, should have a chance to give his life to society, just as the man who has failed in business goes into voluntary bankruptcy and puts his property into the hands of the court, so by a useful instead of a useless self-sacrifice passes from dishonor to honor. Finally, to those who would commit suicide because they are out of work or in financial embarrassment the proposed plan would be welcome, because they would receive at once a life support for themselves and families and enough to satisfy their creditors; provision being made for this from the Carnegie hero fund or public appropriation.

To place one's life at the service of the State would not necessarily mean the loss of it. Just as in the days of duelling a man who exposed himself to the shot of his adversary was held to have fully satisfied "the code of honor," so a man who volunteered for the death service might after he had performed some important feat of daring, or after a few years during which he held himself ready to run any risks, be honorably discharged and return to ordinary life, his wounded vanity healed, or the penalty of his crime paid.

It should be observed that in this the State does not become an accomplice or beneficiary of crime, nor is it deriving a benefit from an evil which cannot be checked, such as using the revenue from liquor licenses for the support of schools.

It is, on the contrary, offering to the individual contemplating suicide an opportunity by which he can substitute a good deed for a crime, for to sacrifice one's life for the benefit of others is regarded as a heroic and virtuous act. Instead of lying in a felon's grave, he will rest beneath a Thorwaldsen lion.

Canada's Anti-American Tariff Intentions

THE Hon. W. S. Fielding, the Canadian Minister of Finance, made a notable budget speech last week, in which he proposed certain tariff changes that are worthy the attention of our Congress and people. Some of these changes are to be enacted into law during the present Parliament, and the others are to be the basis of a general revision and reconstruction of the Canadian tariff next year. Among the immediate changes recommended are a special duty to be imposed upon goods "dumped" on the Canadian market, the duty being the difference between the "slaughter" price and the fair value of the goods in the market of export. This is the threat of a tariff blow to the United States; but even the British preference does not escape, an increased duty being proposed for certain articles, chiefly woolens, which come in under that preference to the injury of the Canadian manufacturer, although this increase is largely offset by a decreased duty on other articles.

The more remote changes to follow a thorough tariff investigation by the Government are a maximum general tariff applied to countries whose trade policy is hostile to Canada; a minimum general tariff for countries whose policy is more liberal, and the continuance of the British preference. It may be said with good reason that all these recommendations are likely to become law, as times in Canada are prosperous and the Liberal Government has a sufficient majority behind it. Moreover, the opposition of the Conservatives will be largely anticipated by the proposed legislation, as tariff hostility to the United States has been one of their party shibboleths for a quarter of a century.

Tho Mr. Fielding did not once mention the United States in that part of his speech relating to dumping, he quoted Mr. Cleveland's expression on a memorable occasion, "It is a condition and not a theory which confronts us," and, declining to discuss the comparative merits of free trade and protection, pointed to the alarm of Canadian manufacturers concerning a probable business depression in this country in the near future. It is chiefly to forestall, therefore, the dumping of goods caused by such depressions or gluts of our market that Mr. Fielding asks the support of Parliament. It is a measure for special occasions, a sword hanging by a thread, and designed to fall upon American dumpers and Canadian importers in collusion with them whenever the Dominion Minister of Customs or his officers are satisfied that the actual selling price of goods is less than the fair market value. This value, as already intimated, will be fixed by the Canadian authorities on their investigation of the actual selling price in this country. Judging by the articles already selected, Mr. Fielding's measure is aimed at our trust-made goods, especially iron and steel products. The discretion of the Candian officials is, however, limited in these cases to the imposition of 15 per cent. ad valorem, since the Dominion Government already pays a bounty; while in other cases the limit of the special duty is 50 per cent. of the present duty. From these facts it is evident that, notwithstanding some reductions for the benefit of the Canadian consumer, the general effect of the foreshadowed legislation will be protective, and that it is this country against which new tariff defenses are chiefly to be erected.

We take this to be a final confession, made, too, by the Canadian political party at one time pledged to secure a measure of reciprocity with the United States, that no such measure is to be hoped for from Washington. More than that, it indicates that both the political parties across the border are approaching something like an agreement for a higher tariff. Our denial of reciprocity, together with Canadian interest in Mr. Chamberlain's scheme and the spirit that prompted the surtax against Germany, bids fair to make the Dominion a thoroughly protective country. The German surtax is, in fact, the beginning of a maximum general tariff, as Mr. Fielding intimated; and as all highly protective

countries will be affected by it, their diminished exports to Canada will cause increased British exports under the preference.

It is eminently worth the while of our protectionist Senators to consider whether Canada ought not, on exceptional grounds, to be given some measure of reciprocity, otherwise the rapid growth of our exports across the northern border will certainly be interfered with. This growth in recent years has been remarkable, having already reached more than $125,000,000 annually, and winning its way in the teeth of the British preference. If Canadian reciprocity is ever to become a fact, now is the time, before our neighbors are committed to a policy leading them away from, instead of binding them closer to, the economic unity of their own continent. They want a regular and secure trade with us on fairer terms, to offset the heavy balance of more than seventy millions against them. They do not object to the dumping of our trust-made goods on account of their cheapness, but on account of the weapon which it puts into the power of the trusts. Mr. Fielding stated this very clearly when he said that if the trusts and combines would bind themselves to supply Canada with their goods at lowest prices for the next fifty years, it would at present be wise for the Dominion to close up certain industries and turn the people to other branches; but the fear is that, with the crushing out of Canadian competition by excessively cheap goods sold for that purpose, the end of cheapness would come and the beginning of dearness would be at hand. Will the protectionist Senators at Washington pay any more attention to this latest result of their attitude than they have to the arguments and protests in behalf of all the reciprocity treaties they have nullified since the McKinley bill was passed? We fear not; but it is clear that Canada, with whom our most historic experiment in reciprocity has already been made, will not incline that way again unless we take the initiative.

New Sayings of Jesus

The new sayings of Jesus discovered at Oxyrhynchus, near where the Logia of 1897 were found, have just been published by the Oxford University Press (American Branch, New York), together with a fragment of a lost Gospel. The little volume contains a *fac-simile* of the papyrus, transcriptions and translations, with a critical commentary by Bernard P. Grenfell, Lucy W. Drexel and Arthur S. Hunt. The editors regard these fragments as of the same early date as the other Logia, and as originating in the first century. What is of greatest interest from a critical point of view is that we have in this new find what seems to be an introduction to the whole collection in these words:

"These are the (wonderful?) words which Jesus the living (Lord) spoke to . . . . and Thomas, and he said unto (them), Every one that hearkens to these words shall never taste of death."

There are five other sayings, of which the following is the longest and most important:

"Jesus saith (Ye ask? Who are those) that draw us (to the Kingdom, if) the Kingdom is in Heaven? . . . the fowls of the air, and all beasts that are under the earth or upon the earth, and the fishes of the sea (these are they which draw) you, and the Kingdom of Heaven is within you; and whoever shall know himself shall find it. (Strive therefore?) to know yourselves, and ye shall be aware that ye are the sons of the (almighty?) Father; (and?) ye shall know that ye are in (the city of God?), and ye are (the city?)."

The editors call attention to the fact that these sayings indicate that the mystical and speculative element may have been more general and less peculiarly Johannine than has hitherto been taken for granted. The fragment of a Gospel is apparently a third century manuscript and is closely connected with the Gospel according to the Egyptians and that used by the author of the Second Epistle of Clement, as is shown by this remarkable passage:

"His disciples say unto him, When wilt thou be manifest to us, and when shall we see thee? He saith, When ye shall be stripped and not be ashamed."

Mr. Knox Goes to the Senate

The State of Pennsylvania deserves to be congratulated upon the appointment of Mr. Knox to the Senate. If it be true that he was not the choice of the Republican leaders in the Western

counties, then their failure to perceive the expediency of supporting so excellent a candidate is to their discredit. His equipment in ability, character and knowledge of public affairs is all that could be desired. Of course, it seems curious to some that his appointment should have been promoted, if not indeed procured, by the conferences of half-a-dozen men, the most prominent of whom is a Democrat, but it should be borne in mind that this vacancy was to be filled by appointment, not by election; that the Governor was to be advised; that a few men of dominating influence are accustomed to control the course of the Republican party in Pennsylvania; and that Mr. Cassatt, as representing the large interests of the Pennsylvania Railroad Company, may approach a question of this character in a non-partisan frame of mind. His interest and that of his company is manifested with respect to the Senatorial office, and not with regard to the partisan affiliations of the incumbent of it. Incidentally, it appears that Mr. Frick stands for the Steel Corporation, and is associated with Mr. Rockefeller; also, that Mr. Cassatt's company would probably be one of the defendants if the Department of Justice should prosecute what is called the Coal Trust; but Mr. Knox is not a man who could be induced to make a bargain with interests which his official duty might require him to attack in the courts, and his withdrawal from the Cabinet cannot prevent the enforcement of the President's policy, of which, he says, he has been no more than an exponent. The enforcement of the Anti-Trust laws will rest with Mr. Roosevelt, as it has in the past. It is amusing to see Democratic statesmen and journals that were recently asserting that Mr. Knox was a friend of the Trusts and that he intended to begin no more prosecutions, now saying that the Trusts have taken him out of the Cabinet to prevent him from suing them. We remember that Mr. Knox planned and suggested to the House a bill of considerable importance, imposing a denial of transportation facilities as a penalty to be paid by manufacturing combinations for violating the Anti-Trust law. It was accepted by the House, but ignored by the Senate. In his new office he will have an opportunity to insist upon a consideration of this bill, the enactment of which would not please the gentlemen who procured his appointment.

The Perdicaris Case

Some people who ought to have more intelligence are drawing an invidious contrast between the way our Government sought the release of Miss Stone and the way it exerts itself for Mr. Perdicaris. The cases are alike in the bare fact that both were forcibly abducted. Miss Stone was captured by emissaries of the Macedonian insurgents, who asked nothing but money for her ransom with which to fight Turkey. The ransom had to be paid, as it will have to be paid for Mr. Perdicaris. Our Government used all needful pressure upon Turkey, which Power was anxious enough to punish her insurgent enemies. There was no lack of activity, but long delay, because, we venture to say, of blunders of our own agents, who were, indeed, too active; but at last the ransom was paid and Miss Stone was released. But in this case the rebel chief Raisouli is not satisfied with ransom, but demands pardon for his rebellion, the guaranty of England and the United States for his protection, the recognition of his authority, and the removal of governors who are his enemies. All this we cannot grant or uphold, even if an American citizen should be killed. Nor does our Government now, any more than then, propose to pay the ransom—that may be raised as it may by Mr. Perdicaris or the Moroccan Government, and it is none of our business what concessions the Sultan may make to the rebel chief; we only ask that he secure the release of Mr. Perdicaris, while the English Government does precisely the same for his companion. Our Government took just as earnest pains to free Miss Stone as it does now to free the present prisoner, and there is no occasion for criticism.

We regret that Mr. Herbert Welsh, of Philadelphia, has found it necessary to discontinue the publication of his weekly paper, *City and State*. It has done good service for municipal reform. Mr. Welsh asked for contributions to an endowment fund of $100,000, but the money was not forthcoming.

Financial

Crops and Trade

We are now getting the first of the official crop reports, and they are of an encouraging character. Good crops are especially needed this year, to counteract a decliniing tendency in the manufacturing industries. The Government's cotton report points to a very heavy yield, showing an increase of 9.8 per cent. (or nearly 3,000,000 acres) in acreage, while the average condition of the growing plant is 83, against only 74 at the corresponding date last year. It is quite probable that this is an underestimate of the increase of area, for one of the unofficial authorities has made an inquiry that leads it to report an addition of 11.6 per cent. At all events, barring extraordinary injury, the crop will be a large one and may be the largest ever harvested. Naturally, the price of cotton has recently declined. Lower prices now, with prices still lower expected in the future, have encouraged manufacturers and prevented a further reduction of wages in the Fall River mills. At reasonable prices the planters, enriched by their sales of the last crop at very high rates, will have nothing to complain of, while mill hands will gain something.

The Government's wheat report, published on the 10th, indicates a crop of 657,021,000 bushels, against 637,821,000 harvested last year, and an average of 625,000,000 for the last five years. Altho the condition of winter wheat (77.7, against 82.2 last year at the corresponding date) leaves something to be desired, and the area of that part of the entire crop has been reduced by 5,000,000 acres, spring wheat, with nearly the same area as that of last year, is in fine condition (93.4), and may show a yield larger than last year's by 50,000,000 bushels. A great crop of oats is promised, exceeding that of 1903 by more than 100,000,000 bushels; rye may fall a little below the last harvest, but the report indicates that 8½ per cent. will be added to the barley crop. A good yield of cereals should stimulate our export trade in them, which has sharply declined, owing chiefly to competition from Argentina and other comparatively new fields of production.

Consumptive demand for manufactured goods has been checked by the maintenance of high prices, which tend to keep up the cost of living, while many consumers' power to buy has been impaired. For example, one of the trade authorities says: "List prices for iron and steel products are maintained in most cases, mainly because of agreements rather than the support of consumption. Demand is extremely limited." In many instances the prices maintained by agreements, pools, or Trusts could be reduced without compelling any reduction of wages; in other cases, a lower level can be reached only by reducing both. Unreasonable prices must fall if some classes of goods are to be marketed in satisfactory quantities.

The Western Union Telegraph Company's report for the quarter ending on the 30th inst. shows that the surplus on that date will be $14,928,637, against $14,588,205 at the end of the preceding quarter.

....Albert B. Pitkin has been elected President of the American Locomotive Company, to succeed the late Samuel R. Callaway. Mr. Pitkin has been Vice-President, and was formerly general manager of the Schenectady Locomotive Works.

....The Bowery Savings Bank, of which William H. S. Wood is President, has a new feature in its business which is growing in popularity, by which people living at a distance can become depositors. A person, by sending registered letters, money orders, or drafts, from any part of the United States, can become a depositor as easily as if the person lived in New York City. A little pamphlet giving full particulars has recently been published by the bank. The Bowery Savings Bank was chartered in 1834, and has more than 140,000 depositors.

....Samuel S. Campbell has been elected Cashier of the Merchants' National Bank in place of William B. T. Keyser, resigned. Mr. Campbell was born and educated in New Jersey, and after being in the railroad business for two years entered the service of the Fifth Avenue

Insurance

The Fourth of July Hazard in Chicago

THE Chicago Amusement Association has compiled data relating to deaths and casualties that have resulted in that city because of the "fireworks" method of celebrating July 4th. From the subjoined list it will be seen that the celebration of Independence Day during the last five years has cost the Windy City seventy-one lives and has given rise to 1,200 casualties. The following is the casualty list, with property loss, chargeable to the use of fireworks in Chicago for the years indicated:

	Killed.	Injured.	Fire loss.
1899	9	165	$56,000
1900	14	201	68,000
1901	15	233	96,000
1902	14	287	72,000
1903	19	314	103,000
Total	71	1,200	$395,000

In view of the alarming figures quoted it seems a pity that while thousands of subscribers have given small sums with eagerness toward a fund for a celebration that should be free from fire hazards in celebrating the Fourth of July the lack of needful large donations has made it necessary for the Chicago Amusement Association to abandon its laudable project of preventing the general discharge of fireworks upon Chicago streets by attracting the people to the parks on Independence Day.

Agents' Advanced Methods in Life Insurance

A CERTAIN very successful life insurance agent in Boston does a considerable amount of business through the agency of the marriage columns in the daily papers. Obtaining the names of young men who figure in the announced matrimonial alliances, he looks up their addresses and finds out as much about them as possible. When he has some knowledge of their individual habits, incomes, social connections, business positions, etc., this agent calls upon each "suspect" and deftly points out to him the advisability of protecting his wife and possible family with life insurance. He is known to be very successful with his system here touched upon.

THAT Asbury Park, New Jersey, intends to provide fire protection is quite evident from statements in the local papers that the edict has gone forth from the powers that be, in that popular seaside resort, that every hotel, boarding-house, flat or apartment house, and public hall there, must be equipped with fire-escapes, not later than the fifteenth of July next. The penalty for neglect to provide fire-escapes has been fixed at $150 fine, plus $25 for each and every day thereafter that the buildings are not so protected. Other seaside resorts may well follow Asbury Park in this direction.

....The lectures by insurance experts which have been delivered during the winter and spring at Yale University have attracted a great deal of interest. Reference was made last week to the closing lecture delivered by James W. Alexander, President of the Equitable Life Assurance Society. Other lectures have been delivered by John M. Holcombe, Vice-President Phœnix Mutual Life Insurance Company; Richard M. Bissell, Vice-President Hartford Fire Insurance Company; A. A. Raven, President Atlantic Mutual Marine Insurance Company; Sylvester C. Dunham, President Travelers' Insurance Company; United States Senator John F. Dryden, President Prudential Insurance Company of America, and John A. McCall, President New York Life Insurance Company. The lectures which the above-named gentlemen and others have delievered on the general subject of insurance will be published in three volumes—one on life, one on fire and one on miscellaneous insurance.

(*Continued from page* 1045.

Bank in 1885, where he remained until 1896, when he became Assistant Cashier of the Merchants' National Bank. Albert S. Cox, Paying Teller, has taken Mr. Campbell's position as Assistant Cashier. The Merchants' Bank, whose capital is $2,000,000, and surplus and profits $1,400,000 celebrated its centennial a year ago. Robert M. Gallaway is President.

....Dividends announced:

Chicago Great Western R'way, Debenture 4's, $2.00 per share, payable July 15th.

Survey of the World

Seeking the Democratic Nomination

To the number of delegates instructed to vote for Judge Parker were added, last week, those of Mississippi and Arkansas, so that now, if we accept the canvasses made by certain Democratic journals, substantially the entire South is in favor of his nomination. As a rule, in States where instructions were not given it is admitted that a majority or nearly all of the delegates intend to vote for him. Senator Daniel says that the Judge will have all the Virginia delegates. Tables based upon canvasses and the instructions give the New York candidate 359 votes on the first ballott (when nearly 100 will be cast for Olney, Gorman and Wall), and to Mr. Hearst 176. The latter's friends claim 233 for him. To the votes of the South for Parker are added those of the instructed delegations of the so-called doubtful States of New York, Indiana and Connecticut; and his friends assume that those of Pennsylvania, New Jersey and several other States will be his on the first or second ballot. Failure to instruct in many States believed to be on his side opens the way, however, for combinations or movements in favor of some other candidate of the conservative type, if such a candidate should be available and if a two-thirds majority should be withheld from Judge Parker for several successive ballots. There is talk about an effort to stampede the convention for Mr. Cleveland. Democratic journals that support Parker assert that Messrs. Guffey, Gorman, Smith and Murphy are interested in such a project, not because of any love on their part for the ex-President, or because they are hostile to the Judge, but for the reason that they distrust and dislike ex-Senator Hill. As a part of this story it is said that a Democrat of New York City (formerly associated with Mr. Whitney), who is now a delegate from Virginia, is for Mr. Cleveland and against Judge Parker, because his street railway interests are opposed to those of Mr. Belmont. one of the Judge's most prominent supporters. It appears to be admitted that overtures from ex-Senator Hill for an agreement with Mr. Murphy, the Tammany leader, have been rejected, and that some of the latter's subordinates are disposed to question his wisdom. Altho these tales about a movement against the Judge and for Mr. Cleveland may not be true, the agencies by which they are given to the public are of such a character that they deserve some consideration. Mr. Bryan has consented to address a meeting in New York of Democrats opposed to Judge Parker, and has sent to them a letter, in which he speaks of "the burglarious methods which are now being employed to foist upon the party a speechless candidate and a meaningless platform."—Much bitterness was shown in the Illinois convention, where instructions for Mr. Hearst were given by a vote of 936 to 395. The convention was controlled by John P. Hopkins, chairman of the State Committee, who is said to have entered into an alliance with the friends of Mr. Hearst with the purpose of defeating Mayor Harrison. The latter was unseated. Mr. Hopkins, an admirer of Mr. Cleveland, is one of those who bolted the Bryan ticket. Some say that he controls the delegation and predict that after it has voted two or three times for Hearst he will exert his influence for another candidate. It is

noticeable that since the convention certain Democratic papers complain that advantage of Republican dissension was not taken, and seem inclined to concede a Republican victory in the State.—In the Mississippi platform John Sharp Williams (minority leader in the House) attempts to dispose of the currency question by congratulating the country "upon the vindication of the Democratic contention for an increased volume of real or metallic money by the addition to the world's stock of money metals of $2,000,000,000 in gold within eight years, from which these United States have been able to obtain $700,000,000, thus raising their per capita from $23 to $30. The fact," he continues, "that this result has been reached by no action of the Government, but by the act of God through human instrumentalities of discovery and invention, does not lessen our gratitude."

Other Political Topics

In preparing the temporary roll of delegates for the coming convention, the Republican National Committee, last week, by unanimous vote seated the Addicks men from Delaware and excluded the contesting delegation, led by Senator Ball. It also threw out, by unanimous vote, the La Follette delegates from Wisconsin, and accepted those chosen by the bolters' convention in that State, known as Stalwarts and led by Senators Spooner and Quarles, declaring that these contestants are the regular representatives of the party. This controversy will be taken into the convention. In the opinion of some politicians of experience, it makes the State a doubtful one. The committee decided in favor of the mixed delegations, and against the Lily Whites, from Alabama and Louisiana. Porto Rico and the Philippines are to have two delegates each, who will be permitted to vote.—Mr. Knox will retire from the Cabinet within a few days. His successor will be Mr. Moody, now Secretary of the Navy. Some think that Secretary Cortelyou's place will be given to Representative Metcalf, of California. The latter is also said to be a candidate to succeed Mr. Bard in the Senate, next year. It is reported in Republican papers that no action will be taken before November concerning the combination alleged to exist in the anthracite coal trade, and that William A. Day, Assistant Attorney-General, who has had charge of the collection of evidence and the preparation of cases under the Anti-Trust law, will spend several months in Alaska, investigating charges against Federal officers there. Dispatches from Omaha say that by order of the Department of Justice the prosecution of persons indicted for land frauds has been postponed, owing to a lack of funds.—James N. Tyner, formerly the law officer of the Post Office Department, recently acquitted at a trial on charges set forth in the Bristow report, has sent to the President a long letter, asking him, in view of the acquittal, to retract the accusation expressed in the statement with which that report was transmitted to Congress, and thus "to right a great wrong."

The Issue of Filipino Independence

At a banquet given to the Filipino visitors by the New York Chamber of Commerce, last Friday evening, there was an interesting, and at times almost acrimonious, discussion of the question of Filipino independence. President Schurman, of Cornell University, introduced the subject. Undertaking to define the attitude of the American people, he remarked that they were "still undecided, still perplexed." None of them wanted to admit the islands as Territories or States. Some development from the present status along the lines of home rule and ultimate independence, he thought, was the more general desire and expectation:

> "Some favor independence in a few years; critics call them idealists, yet history proves that idealists in politics are generally the most practical statesmen. Others say it will take a century to fit you gentlemen to govern yourselves. We prepared the Panamans for independence in twenty-four hours, and the Cubans in twenty-four months. Ten years are 3,650 days. Are Panamans 3,650 times as swift in their political development as the Filipinos? We believe in the government of the Filipinos by the Filipinos and one day, I have no doubt, the Filipinos will be masters of their own political destiny, like Canada or like Cuba."

Secretary Taft, following President Schurman, said he had been advised

that there would be no discussion of such questions, but there was no issue concerning the islands that President Schurman had not put into his speech. In dealing with the Filipino people it was important to tell them the exact truth. Mr. Schurman had expressed various opinions within only four years. It was not wise to bind ourselves as to what we should do twenty-five years or three generations hence:

"If the time comes when the Filipino people are prepared for independent self-government, God knows I want to give it to them. I am not in favor of keeping them from having independence when they are fit to govern themselves. But the present important thing is to make them fit; and by projecting into every political issue that you send out to the islands the question of independence you are robbing those who are there attempting to build up a popular Government of the opportunity to get the attention of all the people of those islands in the building up of such a Government. My Filipino friends know that there are 90 per cent. of the people there that need education, elementary education, in order to fit them for self-government. That is the task we have set our hands to. Shall we be turned away from it by discussions as to details of what we are going to do in the future?"

Referring to the provision for the election of a popular assembly, he said that the assembly would be a political lesson. We should wait to see "how that works." Our policy should be that nothing should be done in the islands which is not for the benefit of the Filipinos. He wished that the "so-called anti-imperialists" would come to Washington and help him to get a reduction of the tariff on Philippine products and to get legislation needed for the development of the islands by railroads and the issuing of bonds. Mr. Whitelaw Reid, who presided, commented with some severity upon the "idealists" or "sincere sentimentalists," who had always been with us. The same class had disapproved the acts of Lincoln. Now they were anxious to get rid of the Philippines. Dr. Pardo de Tavera, for the visitors, said they had been glad to hear from everybody that the islands were not to be held for the purpose of exploiting them. There were in the islands a considerable number of Americans who insulted the Filipinos daily, saying that they were an inferior race, not able to govern themselves. He could now return to the islands and say that those residents did not represent the American people.—Major-General Corbin, now commanding the Department of the East, at New York, will succeed Major-General Wade in command of the Philippines, in October. It is expected that upon the retirement of General Chaffee, in April next, he will be made Liteutenant-General. Some had thought that General Wood (now in Mindanao) would be General Wade's successor.

Colorado's Labor War

It was reported at the end of last week that no member of the miners' union remained at large in the Cripple Creek district. About 100 prisoners were in the "bull-pen." The number of those arrested is said to have been 400; many have been deported to Kansas or New Mexico; others have been transferred to jail. It is said that about 500 other persons who have left the district were summoned to military headquarters and required to choose between imprisonment and departure within 24 hours; also that, in addition, more than 1,000 residents who were in sympathy with the union have found it expedient to go to other places. On the 15th Judge Thayer, of the Federal Circuit Court, in St. Louis, granted a writ of habeas corpus requiring Governor Peabody and General Bell to bring before him, on July 5th, President Moyer, of the miners' union, who had been a military prisoner for three months, and was then confined in Telluride. On the same day Governor Peabody withdrew the militia from Telluride (where martial law had been proclaimed) and ordered that Moyer be turned over to the civil authorities. At first it was stated that he did this after hearing of Judge Thayer's action, but the Governor has since said that the transfer of Moyer was ordered before the news of Judge Thayer's writ of habeas corpus reached Denver. Moyer was at first held by the civil authorities on a charge that he had desecrated the flag; he has since been accused of abetting the dynamite murders at Independ-

ence, and warrants are out for 87 prominent members of the union upon the same charge. On the 13th Frank J. Hangs, attorney for the Western Federation of Miners, was arrested by General Bell and imprisoned in the "bull-pen," where he was not allowed to communicate with any one. His confinement was required, General Bell explained, for the peace of the county and the State. Press reports say that Joseph Reed, a member of the senior class in the University of Denver, has been expelled because he criticised the course of the Governor. Both Governor Peabody and General Bell give prominence in their denunciation of the union to the assertion that it is socialistic. The former says that the union two years ago "indorsed the principles of socialism," which, "as well as dynamiting and assassination, are inimical to the best interests of the Commonwealth." Nearly all the mines that were closed after the murders at Independence are now in operation, but the Portland, which was closed by General Bell's order, is still idle. The suit of the President of the company against Governor Peabody for $100,000 has been repudiated by a majority of the Directors. The Governor is defendant in suits for damages amounting to $1,200,000.

Cuba and Porto Rico

The worst storm known in Cuba for ten years has caused much loss of life and property in the vicinity of Santiago. It culminated on the 13th inst. in a hurricane and a rainfall of 14 inches in five hours. The loss was greatest in places whose names recall battles of the recent war; 14 persons were drowned at El Caney, 60 at El Cobre and 6 at Daiquiri. Rivers suddenly rose above their banks, mines were flooded, and at Guantanamo (the site of our projected naval station) the bodies of the dead were swept out into the bay. More than 100 lives were lost, and 150 houses in Santiago were destroyed or wrecked. Railroad traffic was interrupted, telegraph wires were down and for some days there was communication with the remainder of the island only by boat to Manzanillo.—A controversy has arisen over the action of the House, in Havana, at a recent session. The Speaker, a Liberal, being absent at a funeral, a session was held by the Moderates, who proceeded to admit the members of their party whose claims were subject to contest. The Speaker and his party associates assert that this action was illegal. They have seized the seals of the House and taken measures to prevent the payment of the salaries of the contesting members who were seated.—Charles T. Phillips, a resident of Havana, says in a Washington paper that one-quarter of Cuba's realty is owned by Americans; that at the current rate of transfers they will soon own one-half. This points, in his opinion, to annexation.—Among those arriving at New York last week from Porto Rico were Dr. Brioso, of the Executive Council, and Mayor Todd, of San Juan, delegates to the Republican National Convention, accompanied by Señor Rossy, Speaker of the House of Delegates, and Dr. Barbosa, a negro, who was graduated at Michigan University, and is the leader of the Republican party on the island. The failure of the Legislature at its recent session to pass the loan bill for $3,000,000 is said to have been due to a disagreement of the Americans and the natives, the former desiring that the money should be used for schools, roads and other public improvements, while the latter preferred loans for the promotion of agriculture.

French Politics

The bribery scandal precipitated by the charge of Premier Combes that he had been offered a bribe of $400,000 if he would allow the monks of La Grande Chartreuse to remain in the country, but that he had kept silent by the request of M. Millerand, appears from the investigation of the committee appointed by the Chamber of Deputies to be less serious than was supposed. M. Michel Lagrave, a clerk in the Department of Commerce under M. Millerand and now Commissioner General for the St. Louis Exposition, arrived in Paris on Thursday, and was at once brought before the Investigation Committee. The supposed intermediary, M. Chabert, was called before the committee and

stated that in subscribing $20,000 to the campaign fund of the official candidates he had remarked that the monks would doubtless be willing to give much more than that to be let alone. No one has yet been found who directly offered a bribe, or was authorized to do so by the monastery.—The Nationalists of the Opposition, who have been criticising the Government for its supposed lack of patriotism, have a new weapon in a book recently published by M. Hervé, a former professor in the university, in which he uses most violent language against the institutions and patriotic sentiments of France. The assassination of President Carnot he calls "an impatient act of social justice," and he would "cast the flag of Wagram into the dunghill." In a chapter entitled "European Civilization in Africa" he gives a picture of "the French troops smoking out an Arab tribe." Since an instructor in the public schools had bought the book for himself and for six of his pupils, it was considered by the Nationalists that this indicated a deliberate effort on the part of the Government to teach "internationalism" to the youth of France, and the Government was interpellated on the subject. In the debate the Socialist leader, M. Jaurés, said that he did not approve of the form and language of M. Hervé's history, but he considered it "a very interesting and necessary effort." He demanded that there be no interference with

> "the right of the instructors to teach history according to the socialistic spirit, and to propagate the magnificent ideal of international arbitration, of universal peace and of gradual and concerted disarmament."

—The public religious processions of the *Fête-Dieu* on June 5th were the occasion of anti-clerical riots in some French cities, and were forbidden in others lest they should provoke disorder. At Caen, where the street procession was not allowed, some 8,000 men, women and children marched back and forth through the city singing *Sauvez Rome et la France,* and assembled in front of the Church of St. Pierre to receive the blessing of the curé on the balcony. At Angers the procession was stopped by a noisy mob and a general fight ensued, in which the weapons were stones, umbrellas and canes. The police who attempted to stop the riot were severely injured.

The Woman's Congress at Berlin

The International Woman's Congress called by the League of the German Women's Societies at Berlin closed its week's session on Saturday night. All the Continental countries, the United States and Australia were represented, and every form of woman's activity and interest received attention. The congress was divided into four sections, and about 250 addresses were given, including over 30 by American and Canadian delegates. Miss Susan B. Anthony was made honorary president, and was greeted with the greatest enthusiasm by the audiences, and received marked attention from the Empress of Germany, who gave a reception to twenty-one of the delegates. The Empress was not present. The convention was presented by Mrs. Carrie Chapman Catt with a gavel from the women of Wyoming, who have longest enjoyed the right of full suffrage. Mrs. Catt called attention to the high character of the officials in woman suffrage States, and to the laws enacted there for the protection of women and children, and attributed the low average of divorces in Wyoming to the fact that women there had equal rights. Miss Thomas, president of Bryn Mawr College, spoke on "University Education of Women in the United States," showing that more men than women broke down in university work, and that women were not unfitted for matrimony nor disinclined to it. Educated women raised more children to maturity than others of the same social class. Mrs. Alice Horne, a member of the Utah Legislature, described the art work of women in the Utah schools. Mrs. Maud Nathan, of New York, gave an account of the Consumers' League and woman's work in trade organizations. Miss J. J. Dock, of New York, spoke on "Sick Nursing in the United States," as a representative of the National Association of Nurses, with 6,000 members. Mrs. McTerrel, honorary president of

the National Association of Colored Women, read a paper on "Colored Women as House Servants." Miss Blankenberg, of Philadelphia, traced "The Evolution of American Laws Concerning Women." The congress was opened by an address from Frau Marie Stritt, of Dresden, president of the German League, to which the Countess of Aberdeen, president of the International Council, responded. Mass meetings were held and great interest shown by the German women. The municipality of Berlin voted money to defray the expenses of a farewell dinner to the delegates. Garden parties were given by Chancellor von Bülow and the Secretary of the Interior, von Posadowsky-Wehner. Count von Hönsbröck obtained permission to speak and criticised the delegates for accepting such invitations from members of the Government, on account of their recent action against woman's suffrage. "The Secretary of the Interior," said Count von Hönsbröck, "snubbed the movement, but gave you strawberries and cream." Fraulein Freudenberg, of Munich, repelled the criticism, and Fraulein Helene Lange said that the advocates of woman's rights hoped to have an opportunity to meet their direct enemies socially and explain their views. The action referred to was the refusal of the Government to accept the provision for women's voting in the law establishing mercantile arbitration tribunals which had been added to the bill on the first reading. The clause was struck out and the bill passed.

Assassination of General Bobrikoff

Count Bobrikoff, Governor-General of Finland, was shot at the entrance of the Finnish Senate at Helsingfors on the morning of June 16th and died on the following day. The assassin, Eugene Schaumann, a son of Senator Schaumann, immediately committed suicide. He was a university student and an ardent patriot, but it does not appear that the deed was the result of any concerted attempt of a revolutionary society. Schaumann placed himself at the head of the stairs by which the Governor was to pass into the Senate Chamber. As Bobrikoff, in full uniform, started upstairs Schaumann came down and met him on the second landing, where he fired a concealed revolver and shot him through the body; afterward firing two more shots, one of which struck the Governor in the neck as he turned away. Bobrikoff was appointed Governor-General of Finland in April, 1899, to carry out the severe repression policy determined upon by the Government. He suppressed patriotic newspapers, banished many professors, editors, Ministers and prominent men, who protested against the Russification of the Duchy; at the same time putting a stop to the emigration of Finlanders who did not wish to serve in the Russian army. In April, 1902, the Cossacks, by his order, charged the crowds on the streets of Helsingfors, which aroused intense indignation and resulted in some rioting. In April, 1903, the Emperor Nicholas signed a decree investing Bobrikoff with dictatorial powers, by which he was able to arrest and imprison any one without legal action, to close hotels, shops or factories, prohibit private meetings, dissolve associations, and expel from Finland any persons he considered dangerous. His opinion of the situation in Finland was given to a Russian literary man, Belaieff, a few days before his death, and includes the following important paragraphs, on which we comment in our editorial columns:

"The Finns thoroughly understand the state of affairs, and are maintaining correct relations toward the Russian administration.

"The trouble is all with the Swedes. Swedomania is still a very strong propaganda, and is pushed in the most underhanded and disreputable fashion. In order to poison the people's minds proclamations are showered from Sweden. We seize what we can, but wherever one head is chopped off another grows. My sympathies are on the side of the Old Finns, who form seven-eighths of the population. I believe in them. The majority of the Senate is composed of Old Finns. I selected them. I prefer them to the Swedes, hence the hostility of the latter. Helsingfors gives me no rest night or day. The city is a hotbed of dissension.

"The Finns do not sympathize with us. They rejoice at the Japanese victories. There is no denying that it is a difficult time for us, especially in regard to our frontiers. Concessions are necessary, but at the same time they are not advisable yet."

It is expected that the Czar will prevent

a convocation of the Diet as a punishment on the people. The expectation that Lieutenant-General von Wahl will be appointed Governor-General of Finland increases the apprehension that the repression policy of the Russian Government will be continued and even increased. General von Wahl was Chief of Police at St. Petersburg during the student riots of 1895, and was afterward made Governor of Nizhni Novgorod. On May 18th, 1902, an attempt was made to assassinate him at Vilna by a man who stepped up behind him in the dark and fired at him twice with a revolver, wounding him in the left hand and right foot. The man was arrested and hanged. General Turbine will temporarily succeed General Bobrikoff as Governor-General of Finland. The assassination is strongly condemned by the conservative element among the Finns, but it is recognized by the European press that the act was natural under the circumstances.

Naval Movements

The Vladivostok squadron of three cruisers made a raid on the Straits of Korea last week and attacked three Japanese transports. Vice Admiral Skrydloff left Vladivostok with the armored cruisers the "Rossia," the "Gromoboi," the "Rurik," and some torpedo boats. The protected cruiser "Bogatyr" has been hauled off the rocks and towed into the harbor of Vladivostok, where it is being repaired. The Russian fleet sighted the transport "Hitache" on the morning of the 15th and signaled her to stop. This was obeyed, but she afterward attempted to escape. The Russians followed and opened a heavy fire, hitting the vessel 60 times. One shell struck the engine and killed 200 men. The Russian fire raked the crowded decks until they were covered with corpses. Colonel Campbell, the English master of the transport, jumped overboard, and is missing; the commander of troops, Colonel Luchi, burned the flag, and, together with many of the other officers and soldiers, committed suicide. Some of the crew and troops escaped. By six o'clock in the evening the vessel was submerged. The transport "Sado" was encountered 35 miles west of Shiro Island. A boat was sent by the "Sado" to the Russians, who stated that 40 minutes would be given to permit the non-combatants, said to number 610, to leave. The chief mate, an Englishman, was taken on board. Before the expiration of the 40 minutes, it is claimed, the Russians torpedoed the ship, from both sides, damaging it, but not sinking it. It went aground on Okino Island, and was towed to port. Altogether 509 survivors of these two transports are known to have reached shore. The "Idzumi," a transport homeward bound with sick soldiers, was shelled and sunk. The steamer "Katsuno," which set out to rescue the survivors of the transports, collided with the steamer "Yamatokan," bound on the same errand, and was sunk off Moji. The Russian squadron has returned to Vladivostok. Kai-Ping, on the west coast of the Liao-Tung peninsula, and Ying-Kow, the port of Niuchwang, have been bombarded by Japanese cruisers, and the latter port has been in consequence evacuated by 3,000 Russian troops, with 20 guns.—The British collier "Allanton," loaded with 6,500 tons of anthracite, was captured and taken to Vladivostok, to be tried by a prize court. The crew consisted of 30 British subjects. A fourth unsuccessful attempt to blockade the entrance to the harbor of Port Arthur by four fire ships is reported by the Russians. The "Novik" is said to have passed out of the harbor without interference. The Japanese outposts are 18 miles from Port Arthur, two miles from the Russian outposts.

The Battle of Wafang-Kao

By hard and almost continuous fighting from June 11th to June 16th the Japanese have driven the Russians northward, and have made themselves masters of the whole Liao-Tung peninsula, with the exception of Port Arthur, now beseiged. The attempt of General Stackelberg to relieve Port Arthur, or at least to create a diversion by attacking General Oku in the rear, has completely failed, and, after receiving and inflicting heavy losses, the Russians are in full retreat toward Hai-Cheng. This is a sta-

tion on the railroad near Niuchwang, and, if the Russians attempt to hold the place, it is likely to be soon the scene of the most extensive engagement of the war, since all three of the Japanese armies can be concentrated there, from the Liao-Tung peninsula on the south, from Siu-Yen on the southeast, and Feng-Wang-Cheng on the east. There is also no apparent reason why a Japanese force could not now be landed at Ying-Kow, the port of Niuchwang, and approach to Hai-Cheng from the west. The fighting began by a series of night attacks on the 11th and 12th on the Russian advance posts by Japanese advancing moving north from Polan-Tien. The Russians had chosen a strong position on Hights of Wafang-Kao, overlooking the valley of the Tassa River, and were dislodged only after two days' hard fighting. Here, as in the battles of the Yalu and Nan-Shan hill ,the Japanese artillery did the principal part of the work, both in preparing for assaults and in pursuit of the retreating enemy. Two batteries of the first Russian artillery were literally cut to pieces by the Japanese shells, thirteen out of sixteen guns being put out of action and abandoned. From the Russian reports the Japanese outnumbered them in troops as well as guns, the Russians having 42 battalions while the Japanese had 44 and over 200 guns. The Russian soldiers fought with the greatest bravery and did not retreat until forced to by the Japanese turning their right flank. The total Russian losses were about 2,000 dead, and many times that number wounded and prisoners; 1,100 wounded men and 55 officers were taken by the hospital trains to Liao-Yang. General Oku reports that he buried 1,516 Russians on the field. The Japanese losses are reported as about 900. Seven Russian officers and 300 men were taken prisoners. Both parties claim that the other violated the rules of war, the Japanese by shelling a Red Cross station and the Russians by advancing under Japanese flag. Charges of the mutilation of bodies are also mutually made. One unexpected feature of this battle was the effective use of their cavalry by the Japanese, an arm in which they were supposed to be weak. The Russian left had been reinforced until it outnumbered the opposing Japanese, when the Japanese cavalry, which came from Pitsu-Wo on the east coast of the peninsula, swept round the Russian left and turned the tide of battle, afterward pursuing the Cossacks as they retired. The sixth company of the third regiment in a charge of the Russian left reached the shelter of the Japanese trenches with a loss of all their officers and half their men. Here there was a hand to hand fight with stones and gun-butts on both sides until the remainder of the Russians, taking refuge in a ravine, were cut down by shell fire from the Japanese artillery. Fighting is still going on at Kai-Ping on the railroad as we go to press.

Raisuli Unsatisfied

As fast as one of his conditions is met Raisuli makes more stipulations, until there is some doubt now of being able to meet his demands. The $55,000 ransom was raised and ready to be paid over, the members of Raisuli's band which were in prison were ready to be released, and the two sheiks of Beni M'Suar whom Raisuli demanded on account of their hostile action toward him were captured by the Governor of Tangier, but now he refuses to release Perdicaris and Varley unless the captive tribesmen and the money are brought to him in his mountain fastness. The Sherif of Wazan, who is a more direct descendant of the Prophet than the Sultan, and who has been educated in France, is acting as intermediary, and the matter may be placed in his hands. The situation has been complicated by the action of the Sultan in sending about 400 Moorish troops of the worst type to Tangier. These men are more feared by the foreign residents than are the bandits, and protests have been made against them by Great Britain and the United States, and troops may be landed from the ships if the Moorish soldiers remain. The British battleship "Prince of Wales" has arrived at Tangier from Gibraltar. Raisuli declares that the Moorish people as a whole will rise if foreign troops are landed. He lays the blame of the present trouble on the deposed Governor of Tangier, who, he says, persecuted his tribe, killed boys, mutilated children and disregarded all the principles of their religion.

General Kuroki

General Itei Kuroki, the Commander-in-Chief of the First Japanese Army Corps in the Field, whose portrait is here reproduced, drawn by Shugetsu Shoda, was born in the year 1845 in Satsuma (the province of Satsuma is in the southern extremity of Kiushiu and may be called the Sparta of Japan). The hero of the recent battle of Yalu is a typical soldier of Satsuman character. In him there is no element of cowardice. He is courage personified. He lived the life of a soldier from boyhood, gradually rising from a low rank in the army until he was promoted to a generalship.

In the War of Restoration of 1868 he served at the head of a detachment of the Imperial Army. In 1871 he was promoted to the rank of a captain in the Imperial Guard Division. In the South-Western War of 1877 he fought for the Mikado continually for 180 days against Takamori Saigo, a man from his own provence, who rebelled against the Mikado's Government because it had not taken his counsel to reprimand Korea for her misdemeanor in 1875. Among the Satsumans there was a division of opinion. Some sympathized with Saigo, others rebuked him for his error. In 1884, when a prince of Sweden visited Japan, Kuroki, as a staff officer, surprised the visitor with his show of military tactics. In 1892 he was a Lieutenant-General and the Commander of the Sixth Division at Kumamoto. Two years later war was declared between China and Japan. The orders for the movement of the troops were issued. After the regulars and the first reserves of the Sixth Division departed, Kuroki's nerve was severely taxed while he was replacing the vacancy with the second reserves, party because at times he neglected meals and shortened hours of sleep, but chiefly because he was anxious to go to the front rather than stay at home. Later, when he was in the storms of battle fields, he said to some one, "I feel very much relieved now that I am in the field."

In the capture of Wei-Hai-Wei, which was achieved on the land attack by the combination of forces from the Second and the Sixth Divisions, Kuroki had done all in his power to assist Lieutenant-General Sakuma, who was in command of the Second Division, in the joint attack of the stronghold.

Some years after the war, when Generals Yamagata and Oyama were made Field Marshals, Kuroki, together with Oku and Nozu, was promoted to the rank of a general.

JIHEI HASHIGUCHI.

General Oku

General Hokyo Oku, the Commander-in-Chief of the Second Japanese Army Corps in the Field, whose portrait is here reproduced, drawn by Shugetsu Shoda, first made himself prominent in 1877, when, as a Major-Colonel in the Imperial Army, he defended the Castle of Kumamoto, under the command of Major-General Kanjo Tani, against the firm investment of the castle by the South-Western Rebels under Takamori Saigo, Japan's Jefferson Davis. This war, it must be explained, was, like the Civil War of the United States, the war that might have torn Japan asunder. The Castle of Kumamoto once taken by the Rebels, it was apparent that there was no checking of their advance toward the capital city of Tokyo, where they would force the Government officials to do the pleasure of the ringleader. It was Major-Colonel Oku who boldly led the sortie, broke through the besiegers, and established communication with the Imperial reinforcements outside. Thus, he knows what it is to be besieged, and consequently knows how to deal with the besieged in the Port Arthur fortress.

During the Chinese-Japanese War he stayed at home as the Commander of the Sixth Division at Kumamoto, to succeed Lieutenant-General Kuroki, who went to the front. After the war, when Japan was divided into three different sections of military administration—the Eastern, the Middle, and the Western—Lieutenant-General Oku was made the head of the Eastern. At the coronation of Edward VII of England as the Emperor of India, Oku represented Japan in the Indian part of the ceremony. In October, 1903, he was promoted to the rank of a general, and made a permanent member of the Council of War.

Altho he is not a Satsuman, but a Bungoan (the province of Bungo is on the Pacific coast of Kiushiu and may be called the Corinth of Japan), yet, as the Commander-in-Chief of the Second Japanese Army Corps, he has already performed an epoch-making feat at Kin-Chow and at the Nan-Shan Hill. It is but a question of a week or two before he will reach to the climax of this Russo-Japanese War—namely, the Fall of Port Arthur, which even a three year old child knows by instinct will happen.

JIHEI HASHIGUCHI.

General Nozu

General Michitsura Nozu, the probable Commander-in-Chief of the Third Japanese Army Corps, which has not yet been mobilized, and whose portrait, by Shugetsu Shoda, is here reproduced, was born in Satsuma, like General Kuroki, with all the characteristics of a Satsuman. He is a few years the senior of his fellow-provincial soldier. The reasons why he was not placed in command of the First Army are many. Among others, the fact that he had already been in the similar position in time of the Chinese-Japanese War stands pre-eminent, because, when there are other generals, tho younger than yet just as brave as himself, there was no reason why the younger men should not be given a chance.

In his younger days he served as a Major-Colonel in the Imperial Army, in the South-Western Civil War. In the Chinese-Japanese War, however, he had concentrated his energy, which was inspired in him by years of experience of soldier life, and won his fame.

In the beginning of the war, then Lieutenant-General, Nozu went to the front as the Commander of the Fifth Division of Hiroshima. At Ping Yang, perceiving the weakness of the Chinese in the battle in a plain, he attacked the enemy in a plain around the city before the enemy was able to defend the stronghold. This was effective, and the Chinese fled pell-mell toward Yalu. Driving the fugitives on the spur of the moment, he forced his march to Wiju, where, under the direction of the Commander-in-Chief, General Yamagata, he, in conjunction with Lieutenant-General Katsura (the present Premier of Japan), the Commander of the Third Division of Nagoya, led his men across Yalu. While yet the army was marching on, the Commander-in-Chief was recalled by the Mikado himself, partly on account of his disobedience, but chiefly on account of his ill health. And his duties were transferred to Nozu.

After the war Nozu was promoted to the rank of a general, was made the head of the middle section of the military administration, and a permanent member of the Council of War. His generalship, however, is looked upon as somewhat superior to the other two. Altho the Commander-in-Chief of the Third Army is still a thing of mystery to the public, yet if General Nozu should be obliged to assume the position, it is apparent that he will be a sort of a field marshal, despite the report that Field Marshal Yamagata will go to the front and direct the armies in the field.

JIHEI HASHIGUCHI.

Russia Will Crush Japan

BY PRINCE HESPERE OUKAHTOMSKY

[Prince Oukahtomsky is the editor of the St. Petersburg *Viedomosti,* one of the most influential papers in Europe. He is a gentleman of the bedchamber at the court of the Czar and enjoys the personal confidence and friendship of the latter. He is particularly qualified to speak of the war in the Far East, because he is thoroughly acquainted with that part of the world, by reason of long service there, which incidentally procured for him from the Emperor of China the decoration of a mandarin of the first rank, which his portrait shows him wearing—the sash with embroidered dragons. The prince came to this country to attend the St. Louis Fair as a representative of the Russian press. He declared to the writer that there is no truth in the report that Russia sent him to examine our Constitution and mode of government, in view of an intention on the part of Russia to adopt a constitution. The story is wholly false. Russia has no intention of changing her form of government. The Prince was not impressed by the St. Louis Fair in its unfinished condition. He is now returning to Russia.—EDITOR.]

RUSSIA will most assuredly crush Japan, and I look to see her take a large slice of China to pay the expenses of the war, because it will be impossible for the Chinese generals to restrain their troops. They will commit actual hostilities against the Russians, with the result of bringing on a war between Russia and China, or at least such conflicts caused by Chinese aggression as will entitle Russia to very substantial compensation from the Chinese.

When the situation in the Far East has been cleared up by means of ultimate Russian victory, which is inevitable, there will come a reckoning with England, who is undoubtedly responsible for the Japanese attack upon us. England would now like to have better relations with Russia. She desires to come upon the scene smiling and philanthropic, blandly advising peace and holding out her hand to share with us the spoils of victory. But it is now too late. We recognize her as our old enemy, who has ever stood in the path of Russian development, who has by various means held us back from the sea, has constantly, by means of her publications and her machinery for disseminating news, fostered prejudices against us throughout the entire civilized world. This last attack on us is only one of a hundred scores that we have against England, and when our war with Japan is ended it will be not only possible, but also necessary, that we then proceed with the long contemplated expedition to India.

Prince Hespere Oukahtomsky

We must crush Japan. We must disarm her, because she is a menace to the peace of Asia, a disturber who is an enemy of civilization; and we must also drive England out of India, for then only

can there be a permanent peace. Russia will then be without a rival throughout all Asia, and the White Czar will reign everywhere from sea to sea.

The successes which Japan has gained so far are not at all a surprise to me, because Japan has had five or six men to our one in all the battles, for the reason that Russia has had so many points to cover and guard, and, therefore, the force with which she could meet Japan's sudden attack was very small.

The truth of the matter is that we were caught napping. We certainly did not expect that Japan would be foolish enough to attack us. We thought that their great men had too much sense to precipitate what must ultimately, for them, be such a terrible and disastrous conflict. We felt sure that they could see that tho they might be enabled to strike us a few severe blows at first, yet they could not maintain the conflict, and sooner or later we must crush them.

Taken on the whole, the Japanese have not done as well as I expected they would when they began the war. Considering all their advantages they have certainly not accomplished much. The sinking of some vessels of the Port Arthur fleet was to be expected, as the Japanese fleet on the spot was much stronger than that of the Russians. Russia is so large that she has had to divide her ships in a number of fleets, while the Japanese ships were concentrated.

Save the sinking of a few war ships and the defeat of Russian troops in one battle, where three thousand men were killed, the Japanese have practically accomplished nothing, while at the same time their losses in killed and wounded have been as great as ours and some of their ships have been sunk.

Our early disasters are partly due to the negligent good nature of Russia in her dealing with Japan. It is true that at the close of the war between China and Japan Russia interposed to stop hostilities, but she did not do so to Japan's loss. At the time when Russia interposed Japan had already secured all the glory and emolument which could be gained, and it was Russia which aided China to pay a war indemnity of $400,000,000. By reason of this immense payment Japan was able to equip her great fleet, and later this powerful weapon is turned against us, who gave it to the Japanese. It was a mistake in our diplomacy to allow Japan to become so powerful, and the rectification of this error will cost us a deal of trouble. Nevertheless it will be rectified and Japan's power for evil will be forever broken.

England, France and, I believe, even America, in Russia's place, would long since have taken an opportunity to attack and disarm Japan in the interest of their own safety, but Russia for the past twenty-five years has been at peace, and all her statesmen have striven for peace, and her preachers have preached peace, so that the people grew to believe that peace would last forever. Meanwhile, we were busy growing and extending, as we have been growing and extending ever since the seventeenth century. We marked the Japanese and understood their qualities, but our size and power gave us such an immense feeling of security that we did not think it necessary to weaken or disarm them, while the belief that they would attack us never dawned.

It is only of recent years, comparatively speaking, that we have been a neighbor of Japan, by reason of having come to the Pacific Coast, for tho Siberia has long been ours and tho we even projected our interests across the Pacific to Alaska, yet, nevertheless, we had little contact with the Japanese, by reason of the fact that a vast and almost unpeopled waste lay between the real Russia and the Mikado's islands. We were well aware of the fact that the Japanese were aggressive and that they had tyrannized over their neighbors, the peaceful Chinese and Koreans, and also that they had been the worst of all pirates, but still we did not think it necessary to weaken them, and our good natured tolerance of this rival has earned us the rough lesson which we had been receiving.

It was a conflict which certainly had to come, because the Japanese demanded that we shall stop growing and that, of course, is impossible. The wise thing for us to have done would have been to strike them ten years ago, when our relative strength was greater than theirs.

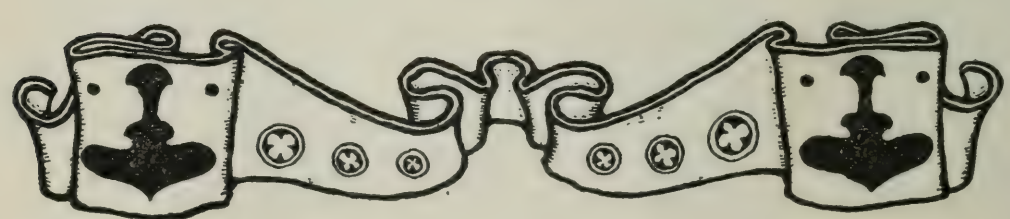
I know that there is some feeling here

concerning Russia's acquisition of Manchuria, but Manchuria lay in the line of Russian advance, and it was the force of evolution that necessitated our occupying that country, which China had practically abandoned. The result of our occupation, involving as it does the construction of the Trans-Siberian Railroad, has been of great benefit, not to Manchuria alone, but also to the entire civilized world.

When the tide of war turns, as it will in a few weeks, and the Americans see that the Japanese are not invariably successful, I expect that there will come a change in the sentiment of the people here, and that they will once more look upon their old friend Russia with favorable eyes. America and Russia should be friends. Together they can do much, and such friendship will be mutually profitable. The reason that America cherishes prejudice against Russia is to be found in the misrepresentation of the English press and news agencies, from which the American newspapers obtain their reports of matters in the Far East. Russia has been portrayed as the enemy of progress and freedom, the oppressor of the poor and indissolubly wedded to despotism.

Really Russia is not a despotism at all, altho the successor of the Czars of Moscow maintains the ancient form of government because of the effect of tradition in a country where one hundred million of the inhabitants are illiterate. So, then, it would seem like a shameful retrogression if the powers of their ruler suffered abatement. Different peoples need different governments.

I note that it has been stated that recently the peasants' communal governments have been taken from them, and the powers formerly vested in the peasants' officers have passed into the hands of appointees of the Governors of Provinces, who, themselves, are appointees of the Czar. There is no truth in that statement. Russia has not retrogressed. The peasants still govern themselves.

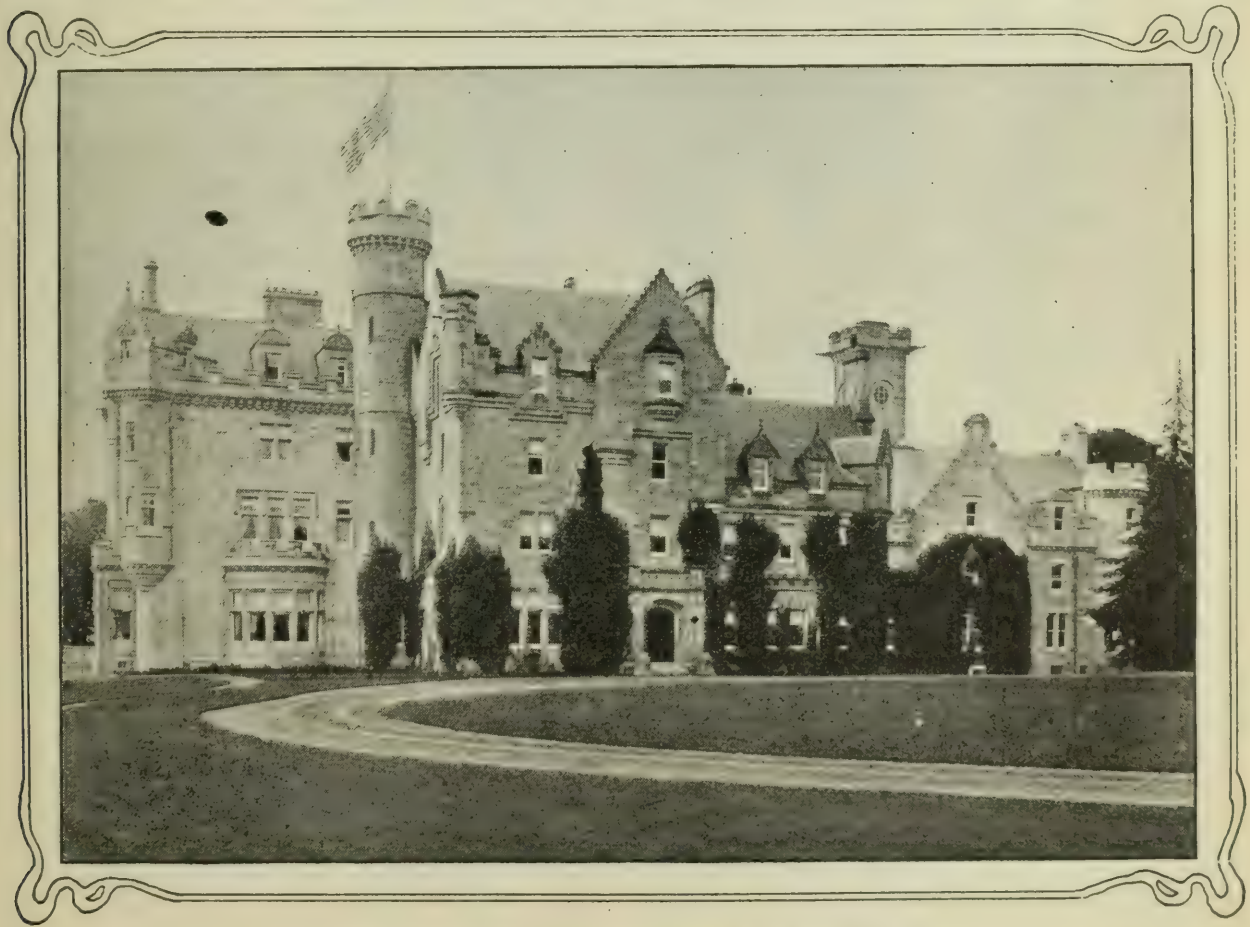


Education also is extending fast. I can see great progress in that matter, and the effect of this work will be to make, in Russia, an increasingly large demand for men of the highest intelligence to carry on her important affairs. That will necessitate the Government paying more attention to education, in regard to which in the past I must admit that we have been lax.

What the world has seen in the past few months in the Far East has been the beginning of the drama "The Evolution of Asia." Russia was asleep when the first blows fell; her people, lulled by twenty-five years of continuous peace, had almost lost their martial spirit. But they are awake now and soon those who stirred them up will regret it. There will be fires in unexpected places.

In a short time we will have 600,000 men in the field, and they will refuse to return home empty handed.

One of the results of the war will probably be the destruction of the present Japanese Government. When the Japanese soldiers are driven out of Manchuria the Japanese nation will turn on their rulers and blame them for venturing to fight on the land.



New York.

Mr. Andrew Carnegie at Skibo

[The following article is written by one of the best-known publicists in England and a personal friend of Mr. Carnegie, but for personal reasons he does not wish his name used. It presents a very charming picture of Mr. Carnegie in his North British home.—EDITOR.]

ANY one more unlike the average millionaire than Mr. Carnegie I have never met. That may possibly be because I have only met him at Skibo or in London on his way to Skibo. In New York he may be quite different; in Pittsburg he may be more different still. The business side of him I do not know. The only Carnegie I have come across is not the Steel King, but the man, the host, the father, the friend and comrade. As such I imagine he would upset any one's preconceived notions of a multimillionaire. They often say in England that the best cure for admiring the House of Lords is to go and see it. The best cure for envying riches is to meet a millionaire. Nothing reconciles me so much to my modest means as to come in close contact with a man struggling in the toils of wealth, tied to it like another Frankenstein to his monster, harassed almost to a certainty, possibly avaricious, probably spoilt, and all but invariably finding out with dull amazement how infinitely harder it is to spend money than to make it. Such a spectacle, and it is far from being an uncommon one, frankly consoles me. I turn from it to my daily work with a firm resolve not to be too successful, not to make too much money. But I will defy any one to keep to this easy contentment after a few days in Mr. Carnegie's company. More remarkable even than his success is the way he takes it. He is the precise antithesis of the conventional "moneyed man." Wealth so far from having spoiled seems hardly to have affected him; he wears it as lightly as a flower. A boy of twenty

Skibo Castle, the Highland Residence of Mr. Carnegie

with a dollar in his pocket and a fishing rod in his hand could not seem more free from care, more chirpy and light hearted than does this modern Maecenas. To a quite extraordinary degree he has kept his heart and nature fresh and green within him; his interest in life and his determination to get as much out of it as possible are absolutely unimpaired. I have never met a man who surrendered himself so wholly and easily to a bout of good humored chaff or enjoyed a yarn with greater zest or was more eager to cap it with a better. Like so many men who have grown up and triumphed in the buoyant American air, he seems to carry within him the secret of perpetual youth. With all his immense practicality and experience he is at bottom a man of great simplicity, not only in his tastes and pleasures, but in his instinctive attitude toward things; perhaps, too, toward people. It is an enviable and delightful quality, only to be found in men who, like Mr. Carnegie, have retained their early enthusiasms, and guarded the elemental emotions, the obvious, wholesome, primal feelings, from the "petty dust" of the outer world. He at any rate has not worn out his soul in piling up millions or blunted or narrowed either his mind or heart in the pursuit of the dollar. No man of our day has shown a keener sense of the responsibilities of wealth, yet no man shoulders those responsibilities with so few signs of effort. In his own room, with his secretary by his side, he may feel the burden of it; but meet him in the corridor outside, in a large-checked knickerbocker suit, a cap on his head and a golf club in his hand, and a blither, jollier, less worried, more entirely detached man you could not wish for. If I could persuade myself that the ownership and administration of a fortune in nine figures would leave me as young and keen and unaffected as it has left Mr. Carnegie, I should be willing to become a millionaire to-morrow.

Andrew Carnegie, from a Cartoon by "Spy," in *Vanity Fair*

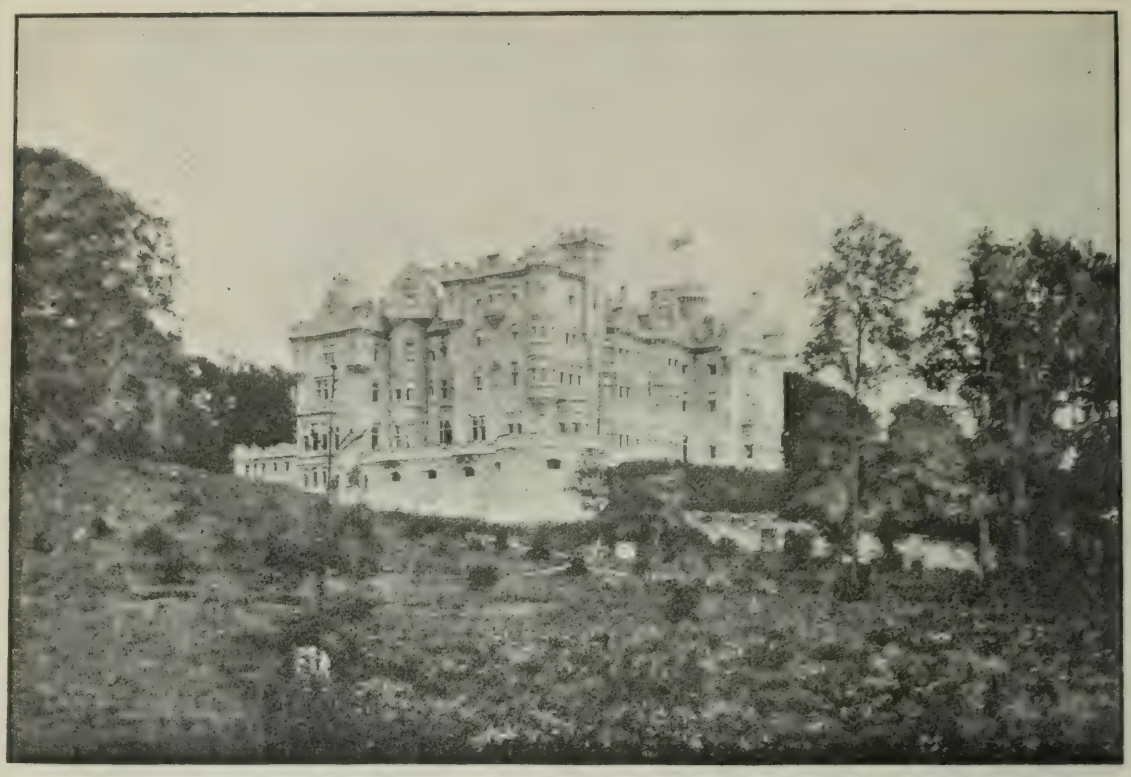
I remember an English journalist describing to me his first evening at Skibo. He missed a train, arrived late and was dining alone. It must have been about a quarter to ten. "While I was eating the door opened just wide enough to allow a man to slip through, and in came Mr. Carnegie. I had never seen him before and my first impression was one of disappointment. This the famous autocrat of the steel trade? A small, wiry, white haired, bronzed-faced, carefully dressed man came gently, half deprecatingly across the carpet. An amazingly small hand of almost womanlike softness was placed in mine. A low,

easy voice said it was extremely glad to know and welcome me. Neither presence, manner, voice nor hand spoke of authority, and it was not till I caught a glimpse of the line of mouth and chin that I could persuade myself that this was really Mr. Carnegie. Stubborn, decisive, strongly edged, the mouth marked the man, or, at least, the manager. But it was his eyes that most held me. They are blue and, like most blue eyes, the mirror of his thoughts. I doubt whether it would be possible for Mr. Carnegie to keep an emotion wholly secret and prevent it from finding a tell-tale expression in those eyes of his. He smiles and frowns with them even tho his lips are silent. I have seen them as hard and forbidding as ice and as tender as a woman's, the face, meanwhile, emotionless. That evening they were active and shining with merriment. A smile of singular sweetness played round his face; it was evident my host was in one of his most sprightly moods. I soon learned why. 'You must finish your dinner as soon as you can,' he said, 'and come downstairs. There's a man there dancing, a Skibo man; just taken three first prizes at the national sports, a thing that's never been done before. It's wonderful. Come downstairs and see it.' I went downstairs into a long oak-paneled room, hung with gun cases, maps of the estate, trophies of rod and gun and the usual impedimenta of a country house smoking room. At one end a movable platform, six inches or so from the ground, was set up. The house party, a rather distinguished one, sat on chairs in rows. The servants stood by the door and round the walls, and the champion dancer danced—reels, sword-dances and hornpipes—till one's eyes began to water. And when it was all over Carnegie stepped on to the platform, put his hand on the man's shoulder and said: 'Angus, you have done better than any one else what a great many men are trying to do. Any one who does that is a man of distinction. You, Angus, are a man of distinction and I am proud of you.' I was delighted. An Englishman might have said the same, but he would have said it in a patronizing way, and he would never have put his hand on his servant's shoulder. Mr. Carnegie spoke as man to man and Angus met him in the same spirit. When he had recovered his breath he made a little speech, beginning, 'My Lords, Ladies and Gentlemen,' in correct form, admitting that he undoubtedly was a man of distinction, but adding that his greatest pride in winning the prizes was the thought that he had conferred honor on Skibo and the Carnegie clan. It was a charming incident and quite impossible south of the Tweed."

I should like to have been present at that scene. It must have summed up many of the characteristics of Mr. Carnegie in his home life—his kindly democratic spirit especially, and his most human interest in all that concerns Skibo. But one cannot be long in his Scottish castle without meeting with instances of both these qualities. There is no more popular laird in all Scotland than the laird of Skibo, and the pride he takes in the affection of the crofters round about is only equaled by the warmth with which he reciprocates it. I was walking one Sunday afternoon in a party that included a baronet, an ex-Cabinet Minister and the head of a great university. A crofter's son took off his hat to Mr. Carnegie. The laird at once left his company, went over to the youth, chatted genially with him for nearly five minutes, and when he rejoined us gave us the whole history of the boy's family and launched into an ardent eulogy of his talent for wood-carving. It is not only because Mr. Carnegie has enormously improved his estate and all who live on it by employing them in drainage works, fencing, building roads and so on, that the people love him; it is that they feel him one of themselves, perfectly accessible and genuinely interested in all their doings. He has the happy knack, wherever he goes, of attracting by the power of sympathy, heartily given out and heartily returned. He is interested in others because he is interested in himself and takes a quietly complacent satisfaction in all he does or says. Mr. Carnegie has found the world a thoroughly agreeable place and does not conceal his approval of it. He is pleased with himself, his friends and above all with Skibo; and his pleasure is totally free from vanity. I have known him to stand for half an hour pointing out to guests the improvements he has already made in the estate and those he intends making, and

tracing on the gravel his plan for forming a loch here and building a dam there to perfect the fishing. Fishing and golf are the hobbies of his life. He has his own golf course laid out on the Skibo estate, and within the last few years has built two elaborate salmon and trout hatcheries. Billiards he plays, but only occasionally. Cards I have never seen him touch, tho I believe whist may be included among his pastimes. He never shoots, but those of his guests who do are welcome to an admirable grouse moor and some first-class deer stalking. Mr. Carnegie keeps a private yacht, anchored almost at the foot of the castle, and from time to time takes a cruise on the firth, but in the Cowes and Larchmont sense he would hardly rank as a yachtsman. Motoring he hates, and his is probably the only great house in the United Kingdom where no motor car is to be found. On the other hand, he keeps about twenty of the finest horses I ever set eyes on, and a bewildering variety of carriages. But nothing will drag him from his allegiance to fishing and golf. Of his links I cannot speak from personal experience, but the rivers and lochs that he either owns or rents furnish unequaled sport.

Skibo Castle stands on Dornoch Firth in Sutherlandshire, away up in the extreme north of Scotland. The climate for some inexplicable reason is that of a northern Riviera, mild and bracing. The best of highland scenery—and there is none better—lies all round. The neighborhood is rich in history and romance.



Private Swimming Pool at Skibo Castle; Hot or Cold Water

Ten miles away stood Macbeth's Castle, with the woods of Dunsinane close by. From the terrace of Skibo one looks over a magnificent panorama of firth and blue hills and rocky streams and woodland, so wide and various that each moment fresh beauties reveal themselves. "If I owned this place," I said to Mr. Carnegie one morning, just before he sailed for America, "I should be sorry to exchange it for New York." "Ah!" said the laird with wistful tenderness, "I just count the days till I get back again." The estate itself includes three or four villages and I know not how many thousands of acres—somewhere I should hazard between forty and sixty. The grounds im-

mediately around the Castle are well laid out and boast some fine cedars and hollies and a remarkably good kitchen garden, but, on the whole, they will scarcely compare with those of many an English estate. The Castle, tho, would hold its own with any modern residence. Most of it is new and built to Mr. Carnegie's orders, but parts of the old mansion still remain —the tower, for instance, from which floats a novel kind of flag—or, rather, two flags in one—the Union Jack on one side and the Stars and Stripes on the other. Inside, while there are naturally few of the curios and relics and famous pictures that belong to ancestral homes, everything is in admirable taste and the best of its kind, and an atmosphere of restfulness and " homeyness " infects one the moment the threshold is crossed. Mr. Carnegie keeps up the old Scotch customs and has added to them one or two of his own. Every morning at eight o'clock a piper marches round the Castle and in the evening plays through the dinner hour. His reveillé lasts till twenty minutes past eight. Punctually at that moment he re-enters the Castle; punctually at that moment the organist sits down to the organ in the hall; and guests who have risen to the wild skirling of the pipes descend to breakfast with the salutation of the organ in their ears. Breakfast at Skibo is a meal that rigorously enforces the equality of the sexes. Nobody is allowed to wait on anybody else; each forages for himself or herself alone. If it is a Sunday there is usually a post prandial stroll through the grounds under Mrs. Carnegie's guidance, to inspect the model dairy, the poultry farm, the stables and the trees along " Ambassadors' Walk," each one of which has been planted by a duly accredited Ambassador. Then a choice between a drive to church and doing as one pleases at Skibo—Mr. Carnegie choosing the latter. Sunday evening host and hostess, guests (if they care to) and all the members of the household assemble in the hall and sing hymns to the organ's accompaniment.

There is one feature of life at Skibo which is rather unusual. Mr. Carnegie detests tobacco. It was some years after Skibo came into his possession before he would consent to so far pander to the frailties of mankind as to add on a smoking room. Up till then guests had been obliged to take their cigars and cigarets and pipes out of doors. To-day smokers at Skibo have everything they can possibly desire except their host's company. He shuns the smoking room; nor does he even allow an after dinner cigaret to be taken in the dining room. There is no lingering over the walnuts and the wine at Skibo, and one of the pastimes of the older guests is to watch a novice lighting his cigar while strolling round the grounds with Mr. Carnegie. He does not do it twice. I do not mean to imply that Mr. Carnegie says anything, but the smoker gradually becomes aware of an anti-nicotine atmosphere, and, being naturally anxious to respect his host's whims, retires to the smoking room when he wishes to light up. In another way, too, the laird of Skibo is carefully deferred to. He likes to lay down the law, and people let him. When they disagree they do it in silence, under the impression—whether right or wrong I do not know—that Mr. Carnegie does not care to be contradicted or argued with. While a man of remarkably wide reading and information, he has, as every one knows, his prejudices. I often think him intolerant and shortsighted in his views, but I do not on that account feel called upon to challenge them. The atmosphere of Skibo somehow makes for acquiescence in Mr. Carnegie's dicta and one is well content to let them pass without argument, especially when they relate, as they usually do, to social and political questions. These are matters on which Mr. Carnegie rather prides himself as an authority, and as he holds forth on them, with closed eyes and wagging forefinger, in a pithy and picturesque style, it is at once easier and pleasanter to listen than to dispute.

In a rich man's castle one expects to find some magnificent toys. At Skibo by far the most magnificent is the private swimming bath, splendidly housed in a building that stands within a few minutes' walk of the Castle. Its glass roof is so constructed as to slide away at the pull of a lever and leave one bathing in the open. The dressing rooms are numerous enough to accommodate a large house party and all the fittings and appointments touch the top notch of comfort. The water is salt and can be warmed at will; and if you have never

Skibo Castle.—Another View

bathed in warm salt water you have still something to live for. Close by the swimming bath stands an electrical power house for lighting the Castle with electricity. That, too, is a splendid toy, if, indeed, one ought not rather to call it a necessity. In the Castle itself the most remarkable features are the organ and electric elevator, that the merest amateur can run, so ingenious is its mechanism, and a huge cabinet in the drawing room filled with the caskets containing the freedom of I know not how many cities. Altogether Skibo is a delightful place, not only in itself, but in the genial, friendly, unpretentious atmosphere that surrounds it. A visitor there may be sure of meeting distinguished men and women, of having all the resources of an ideal country house at his disposal, and of finding in his host an intensely human and attractive character. No one who has studied Mr. Carnegie's career from a distance can help admiring him. No one who has seen him in his singularly happy home life at Skibo can help both admiring and liking him.

London, England.

"Ima Toki Naru Zo"

("NOW'S THE TIME")

TRANSLATED FROM THE JAPANESE BY A. LLOYD

[A popular ballad which I found with this refrain in a Japanese magazine. I have translated it fairly literally, with the exception of the last stanza, which contained a play upon words which it was quite out of my power to reproduce. The piety of the last stanza is a little accentuated in the translation.—A. LLOYD.]

WIDE as the firmament above
Spreads over us our country's love,
While deeper far than Ocean's bed
Our Sovereign's mercy doth us stead.
Your gratitude now would you show?
Ima toki naru zo.

Heroes of the Sacred Land,
In grim array of war that stand,
Sworn to defend your country's right
With steeled hearts and fists clenched tight,
Your loyal bravery would you show?
Ima toki naru zo.

Man's life is but a little space:
In fifty years he's run his race;
Sooner or later he must die;
With chivalry and loyally
To death for Japan would ye go?
Ima toki naru zo.

Heroes that, all along the shore,
Lest the fierce foe his army pour
Into these isles, stand sentinel,
Do your duty brave and well.
The hour of danger would ye know?
Ima toki naru zo.

Trusty seamen of the fleet,
Would ye know when best to meet
Your foe with storm of shot and shell,
From every floating citadel,
From guns above and guns below?
Ima toki naru zo.

Would you know when best to hurl
Through black of night and running swirl
The fell torpedo dealing death?
Would you, holding fast your breath
Deal the swift and secret blow?
Ima toki naru zo.

Now's the time for deeds of fame,
Small your country, great her name.
Bear, and watch, endure, and toil,
Think of glory, not of spoil,
Strike, and Heaven direct the blow?
Ima toki naru zo.

TOKYO, JAPAN.

Spike Riley's Revenge

BY JAMES H. WILLIAMS

[Our readers need no introduction to Mr. Williams, the implacable foe of the crimps and the unswerving champion of the American sailor. Since this article was written Mr. Williams has shipped before the mast and is now on the ocean experiencing the discomforts and pleasures of the sailor's life, which he has so often described. The following yarn, as are all of the author's, is strictly true.—EDITOR.]

BEFORE commencing this yarn I must prepare my readers for what is to follow by introducing my old shipmate and evil genius, Spike Riley. Spike and I have been cronies for years. We have worn the same oil-skins, eaten from the same mess-kid, drank from the same pannikin and slept in the same bunk—by turns. Together we have toiled through many a dirty night at sea, and engaged in many a happy frolic ashore. Sworn brothers, boon companions and bosom friends, Spike and I have gone down the world together looking fate in the face, and taking things as they came without complaint, until our last voyage, when we both got " shanghaied " through Spike's recklessness. But Spike Riley has played a conspicuous part in the adventures which I am about to relate, and in order to appreciate that part the reader should know something of his personality, for Spike Riley is a real, living, sentient person and not a myth.

Spike Riley was born somewhere in Rhode Island, and I was born somewhere in Massachusetts, and to me he has always been the picture of bad luck, for I never met him yet that he did not succeed in getting me in some sort of trouble.

But this is the first time he ever got me shanghaied, and I'll take fine care it will be the last. Spike is a good deal older than I am, old enough to be my daddy, in fact, but I am glad he ain't.

I first met Spike in Calcutta a good many years ago, no matter how many. I had been paid off from the ship "Maine" and went to the Sailors' Home to board. Spike had been discharged from an English ship the same day and came to board at the same place.

He was a long-geared, cadaverous looking individual, with a slight stoop and a resonant nasal twang. The Britishers ashore called him "Yank," and the Yanks dubbed him "Razorback;" but I always addressed him as "Spike," and the name has stuck to him since.

From the first there seemed to be a natural affinity between Spike and me. He was long and slim and I was short and thick, and extremes meet, you know. Spike is not a handsome man. He says it was his watch below when good looks were served out. But tho his features are not in his favor, Spike's heart is in the right place. He is an open-handed, warm-hearted, rollicking sailor of the old school; courageous to the backbone and generous to a fault. A good shipmate, a true friend and an able seaman—I could not say more than this in Spike's behalf, for it takes a good man to make a true sailor and a good animal to make a grizzly bear.

But, as I have said, Spike Riley has always been my evil genius, tho, withal, my best friend. I have never met the old villain yet without serious consequences to myself. At Calcutta he got me "broke" on the police force. In Colombia he got me shot at by a lot of ragged revolutionists. At Valparaiso I came near being knifed by a jealous *caballero* through the unintentional conduct of mischief-making Spike. At Rio he got me marooned during a yellow fever epidemic and I had to stay there six weeks. In South Africa he got me chased through the bush for fourteen days by the Cape Mounted Police, by mistake for a diamond smuggler. In London he got me involved in the big sailors' and dock laborers' strike, and I came near doing a long turn on the treadmill in consequence. At Singapore he got me nearly slaughtered for refusing to drink the Queen's health under compulsion. In America he induced me to squander my substance in riotous living for three days and then got me shanghaied.

But for all these injuries and many more which Spike has consciously or unconsciously inflicted on me I freely forgive him in consideration of one noble deed. One dark night, off the Cape of Good Hope, while we were furling the main topgallant sail in a howling gale of wind, Spike Riley saved me from coming down by the run and nearly lost his own life in the effort. The sail "ballooned" before the wind and struck me in the face, breaking my hold on the "jack stay" and knocking me from the foot rope. "I am gone," I ejaculated, as I felt myself falling, for I fully expected to lose the number of my mess then and there.

"Not yet, sonny," said a familiar voice beside me on the yard arm, and I suddenly felt myself grasped in the steel embrace of one of Spike's long, sinewy, wasplike arms, while with the free hand he clung to a becket on the yard with a tenacity that defied grim Death himself. God bless the man who put the seizings on that becket, for I know that Spike would have gone to oblivion with me sooner than let me go alone. Is it wonderful that I should love this kind-hearted old sailor, who has dared so much for me, or that I should feel disposed to tolerate his natural failings out of sheer admiration for his noble virtues?

In order to recount all the scrapes that Spike has got me into, first and last, and the dare-devil escapades we have been through together I should have to write a big book. For the present I shall only tell how he got me "broke" on the Calcutta police force to gratify his thirst for revenge, for he is a vindictive old scoundrel.

I was quite young and strong in those days, and young sailors of my build were in special demand by the British Indian authorities as police recruits. In an evil moment I enlisted on the Calcutta police

force without consulting Spike Riley. Having been duly examined and found qualified for service, I deliberately took the Queen's oath, accepted the Queen's shilling, donned the Queen's uniform and proceeded to enforce popular compliance with the Queen's statutes regardless of consequences.

My first official exploit was to arrest Spike Riley for fighting and disorderly conduct. My beat included the lower end of Flag Street and "The Numbers," the toughest section of sailor town. "The Numbers" was simply a row of disreputable rum shops in a little side street. They all adjoined each other and were numbered from 1 to 12, hence the name "The Numbers." These places were all conducted by natives and principally frequented by sailors on a frolic. In each place the bar was protected by a row of steel bars reaching from the floor to the ceiling, exactly like a jail, to prevent the sailors from making a raid on the stock behind. The drinks were handed out between the bars to the thirsty tars after the money had been first handed in.

About 10 o'clock one hot night, shortly after my appointment, I was called upon to quell a disturbance in "The Numbers." On my arrival at the scene of turmoil I found Spike in the middle of the narrow street, loudly proclaiming his unfaltering devotion to the Stars and Stripes, and his unquestionable ability to lick anything under the British flag, lion and all. I approached Spike with all the familiarity of an old shipmate, hoping to pacify him and get him down to the Home.

Spike did not recognize me at first, but he did recognize my uniform, and he went for it like a cage full of wildcats suddenly turned loose on a jack rabbit.

Then followed a struggle such as the natives or transients never witnessed before between a minion of the law and a legal offender. I had youth and strength on my side, but Spike had length and reach and a wriggling way. I got a dozen different holds on him—strangle hold included—but he wriggled out of them all with the dexterity and ease of a freshly captured eel. He bit and tore and scratched like a mad tiger, and I fought back for all I was worth, except that I would not use my baton on him. It was in the rainy season and we rolled and tussled and struggled together in the muddy street with the reckless abandon of wild beasts. The whole affair finally settled down to a mere question of lung power, and here the chances were in my favor. Spike finally collapsed through exhaustion and permitted himself to be handcuffed. As I was adjusting the steel bracelets to his wrists he recognized me for the first time during the *mêlée*.

"I'm glad it's you, sonny," he said, savagely, "for I would hate like h—— to give in to a Britisher. But what are you doing in this line of business, anyhow? You are a disgrace to the country you came from."

There were no patrol wagons in Calcutta in those days, and Spike absolutely refused to walk. So I had to shoulder the old scamp and carry him all the way to the "compound," to the great amusement of the onlooking sailors, who had witnessed the exciting arrest.

When I lugged Spike into the "compound" and presented him at the rail, our old Scotch captain stared in unfeigned astonishment at us both. I was bare headed and my once immaculate white uniform was a mess of mud and blood bespattered rags. As for Spike, he was chiefly clothed in lamp-light.

When the old man had satisfied himself as to which of us was the offender and which was the officer, he adjusted his goggles and proceeded to take Spike's pedigree and enter the charges which I glibly preferred against him. He muttered something into his big beard about "Greek meeting Greek," and consigned Spike to cell No. 9 for the night.

Next morning I was on hand in a brand new uniform and a black eye. Before the commissioner I urged every crime on the calendar against Spike short of highway robbery and deliberate murder. Spike stated that I was a notorious liar, that I had forsaken Old Glory for the bloody banner of Old Albion and should not be believed.

The commissioner sentenced Spike to thirty days on the stone pile and to pay a fine of 15 rupees. As Spike did not have the rupees, that meant thirty days more for default—not a pleasant prospect by any means.

When my anger was assuaged somewhat and the first sting of my bruises had worn away, I felt sorry for Spike

and repented for my harshness toward him. In this mood I went up and fixed it about the rupees, and I pled so hard with the commissioner that at length he was reluctantly persuaded to relax his rule and reconsider the sentence imposed on poor Spike. Eventually Spike got off with ten days and a severe reprimand that might as well have been delivered to the Hindu idol, Juggernaut.

But, would you believe it, the ungrateful old wretch returned no thanks for my friendly services in his behalf, but, instead, went off to sea swearing to "get square" with me; and he did.

Spike sailed for Mauritius in the bark "Dundonald" and was gone several months. Meanwhile I continued to wear the Queen's uniform and fight the Queen's battles, regardless of consequences or threats.

One night there was a riot in "The Numbers." A big crowd of tipsy sailors had taken charge of the whole precinct and a whole squad of police was sent down to restore order. A number of arrests were made, and "The Numbers" were peremptorily closed until further orders. When quiet had been restored I was left alone to patrol the district.

By eleven o'clock the streets along my beat were as silent as a grave-yard. For some time no sound reached me, save the echo of my own footsteps on the pavement or the occasional howling of a pack of jackals from the distant woods.

At length, however, I heard footsteps approaching from the direction of the waterfront. By this time I had learned to distinguish between the firm, unfaltering footsteps of an honest man and the stealthy, uncertain tread of a prowling sneak thief or an evil-minded footpad. But these steps had the right ring about them. They indicated to my practiced ear the long, firm stride of a tall man on a business trip, who was not afraid to make himself heard, and one who was prepared to defend his right of way.

The loneliness and silence of my vigil had rendered me unusually inquisitive, and the approaching footsteps excited my curiosity to an unusual degree. Somehow they sounded familiar, but still they sounded all right.

I stepped out to the corner of Flag Street and looked down, just in time to be confronted by a tall apparition in a white suit, cork tobie, alligator shoes and a pleasant look. It was Spike Riley.

"Hello, sonny," he said, cheerily, extending his fin. "I came up looking for you. Glad to see you are still on the force and looking so well. I heard you pounded the stuffin' out of some of them blasted Britishers in 'The Numbers' tonight. Bully for you, sonny; don't spare the baton on them; we've licked 'em twice and we can do it again. But," he continued, good-naturedly, "I am on the sober tack myself now, and so I kept out of it. You mustn't think hard of me for the scrap I gave you last time I was here. You know I was about three sheets in the wind that night and did not recognize you. And, besides, you know how I hate that uniform."

I assured Spike that I entertained the kindest of feelings toward him and told him how glad I was to see him again.

Spike informed me that he had returned from Mauritius that very day with four months' pay under his lee, and that he had come up on purpose to apologize to me and to treat me to a little "blow-out," to show his appreciation for the considerate way in which I had treated him after our late unpleasantness.

I agreed to meet Spike in Bentinck Street as soon as possible after being relieved from duty. As I expected to be relieved at midnight, which was now drawing near, Spike went on ahead to make arrangements for the impending "blow-out."

I now began to look forward with the pleasantest of anticipations to our supper of reconciliation. I counted the minutes until my "relief" arrived, and swore at him roundly for being ten minutes late. As soon as I had made a hurried report to my superior at the "compound," in conformity with the regulations, I repaired at once to Bentinck Street in a gherry without stopping to change my uniform for civilian's dress.

As my chariot dashed around the corner Spike was on the lookout and hailed us to "heave to." I ordered the gherry wallah to pull up. Jumping eagerly to the ground, I met Spike with both fins extended in welcome and wearing a smile that threatened to part his jaw tackle fall.

I discharged the gherry and followed Spike to my own undoing.

At the corner of Chowringie Road and Bentinck Street, obliquely opposite from the Hotel de Europe, was a very snug and well appointed *café*, conducted by a bustling, good-natured German and his frau. The frau was too big to bustle much, but she was good company and could appreciate a joke. When she laughed, which was very often, she always reminded me of a vat full of soft soap riding on a hand-car, she quivered so. It was pleasing to see so much humanity having a good time all at once, and her mirth was highly contagious.

This was the place Spike had selected for the preparation of his diabolical plot to get revenge and, incidentally, to bring irreparable disgrace on my unsuspecting head.

Pursuant to orders previously issued by Spike, our German boniface had everything ready, on our arrival, for our comfort and entertainment.

An eight-course dinner was ready to be served, and two coolie waiters were ready to serve it. The punkah waved back and forth with a vim and regularity during our meal that plainly showed the punkah wallah's high opinion of Sahib Spike's respectability. The night was hot, even for Calcutta, and Spike ordered up four bottles of imported stout to top off our repast.

English ales are not recommended for Americans in the East Indies, either by doctors or reputable saloon keepers. They are heady and liable to capsize your mental faculties and leave you on the broad of your back.

Spike, who had an ax to grind, pretended to be on the "sober tack," and modestly confined himself to one bottle. I polished off the other three with incontinent recklessness.

We sat at the table and spun old cuffers to each other by the fathom for a couple of hours. By and by an "educated" Mahgee came in and started up the piano at a wild gallop. I found out afterward that Spike had bribed her to perform for the occasion. At length she shunted into a soft, dreamy, voluptuous Oriental air that obscured my senses and nearly lulled me to sleep. I saw Spike in duplicate, then I saw him in triplicate, and then—I doubt if I saw him at all.

I remember going into the adjoining room and lying down on the nicely upholstered couch. For a few moments I felt a dumb appreciation of the perfumed air fanned by the regular movement of the punkah swinging over my head. And after that, temporary oblivion.

When I awoke the early daylight was laughing at me through the latticed window. My head seemed to be the only limb I had, and I began to grope around in a dazed sort of way for the other portions of my anatomy. The more I looked the less I found. My mortal remains seemed to be there all right, but nothing else worth mentioning.

My lofty helmet was gone, my weapons were gone, the two rows of brass buttons which had adorned my coat were gone, my shoes were gone and—Spike Riley was gone.

On a further investigation of myself I found a label attached to one of the forsaken buttonholes on my coat bearing this legend:

"DEAR SONNY: I forgot to tell you that I shipped yesterday in the 'Dundee,' and must go down the river with this morning's tide. Am sorry to leave without bidding you good-by, but did not like to disturb your nap. I took some of your runnin' gear to keep you from losing it. See you in Liverpool. SPIKE."

There are certain moments in every man's life that he is loath to recall and would gladly forget if he could. This was one of those profanity-inspiring incidents with me. I made some futile tho emphatic remarks that were not complimentary either to Spike Riley or his ancestors. But what is the use of writing blanks and exclamation points? They never make a story or express your feelings.

The following day I went to Howrah and shipped in the "Allanshaw." Eighty-five days afterward I found myself in Demerara, where, after a good deal of haggling, I managed to get paid off. Then I shipped in a Newfoundland brig and went to Barbados for orders, and there I managed to get paid off again, with tu'pence and a good discharge. After that I shipped in the American bark "Atlantic," bound for Antigua, and eventually landed in New York with $15.50 and a strong determination to lick Spike Riley on sight.

About three years after that I sailed up the noble Penobscot River in a four-masted schooner, with a fair wind and

tide and two thousand tons of coal, to the city of Bangor.

We docked just before dark and got paid off in the cabin. After supper I went ashore with several of my shipmates in search of a drink (for Bangor is a prohibition town).

Passing one of the many saloons which grace the water front, we were attracted by a boisterous Irish parliament within. We mounted the steps and entered, hoping to witness a good disturbance and quench our thirst at the same time.

In the bar-room a jolly crowd of excited mariners were holding forth all at once, everybody talking and nobody listening.

At the further end of the bar stood a long, lanky gantline, dressed in dirty jean pants, a dungaree jumper and a "bucko" cap, who was making more noise than any one else.

I walked over and took a good look at him, and, blast my eyes if it wasn't Spike Riley. I started at once to shed my coat, but the action reminded me that I had on a brand new suit, and I did not feel that I could afford another. So for the time being I decided to act with discretion, instead of valor, and depend on diplomacy instead of fight.

Spike recognized me without asking. "Hullo, sonny!" he exclaimed boisterously, "where did you hail from? When did you leave the police force? I've been inquiring all around for you. You're looking first-rate."

I paid but little attention to Spike's blandishments. I made short answers to his questions and asked him to meet me next morning down on the dock.

"All right, sonny," he answered pleasantly; "I'll be there; but wait a minute." Then he vanished through the back door. In a short time he returned with a canvas ditty bag dangling from his hand by round sinnet lanyard, ornamented by Turks' heads and crowned with a Flemish eye. Dipping his hand in between the nettles, he groped about in the bottom of the bag for a moment and then extracted a lot of badly corroded brass buttons, each one tailed with a patent clasp and surmounted with a raised profile of the British crown.

"Here they are, sonny," he said gayly, extending the handful of trinkets. "I saved 'em for you. The shoes were a little too big, but I managed to wear 'em out. I lost the tobie overboard, going down the Bay of Bengal, and somebody swiped the other things from me in Filmore's house in Liverpool. I'd hate like —— to see you wear them buttons again. They'd look all right with eagles on 'em."

I have never felt such a strange admixture of passions as I did when I took that handful of buttons. Pride, anger, admiration and friendship all struggled for the mastery. At first I was tempted to tackle Spike and prove that I could lick him, suit or no suit. But as I gazed into his honest face and noted the twinkle of his merry blue eyes a big thought surged up in my heart and I forgave him.

I thought of that dark, stormy night in the middle of the drear Antarctic. In imagination I heard again the dismal howling of the wind through our tautened rigging and the booming of the big seas that swept alongside. I heard the breakers swashing across our decks. I saw the white phosphorescent streak astern. Again I felt the mighty floundering of the big topgallant sail struggling in the buntlines. Then I remembered the horrible, despairing sensation as I was leaving the topgallant yard, and again I felt Spike's strong grasp around my back and heard his faithful voice sing out: "Not yet, sonny," and I repented. A big frog leapt into my throat, but I gulped him down. With an impulsive movement I threw the handful of brass emblems of British tyranny into the middle of Union Street. Then, turning to my old chum, I seized his eager, outstretched grappling and we shook.

"Spike," I began, "you saved my life once, and—"

At this juncture Spike tightened his grip on my hand with a force and emphasis that put a stopper on my jaw tackle at once.

"Aw, stow that, sonny!" he exclaimed testily, towing me along toward the bar. "What a' you goin' to have?"

Catching Black Bass on Lake Minocqua, Wisconsin

The Game Fish of the Middle West

BY T. E. GILPIN

[Mr. Gilpin's article, telling of a paradise for fishermen which is too little known throughout the country, is illustrated with photographs made by the author during a recent tour of the Minocqua region.—EDITOR.]

THE countless lakes amid the wild forests of Wisconsin are an angler's paradise, where the great muscallonge strikes savagely, where the bass and wall-eyed pike are plentiful, and where the dainty brook trout, the finest of all fish for sport or eating, are abundant.

Nature here is still wildly beautiful—wildly lovely. The valley of the Wisconsin River is full of picturesqueness. There are evergreen forests of white and Norway pine, with their thin-bunched needles; amid the black oaks grow many-hued hemlocks; fringes of white and black birches surround numberless lakes of clearest water, whose shimmering light is seen through the woods long before the sunlit ripples appear.

Game fish, in spendid abundance, rise to the wiles of the sapling pole of the poorest dweller in a log house as well as to the finest rod in the hands of the sportsman from the comfortable hotel. Guides there are at Lake Minocqua—jolly, rough, good-hearted men, well advised as to the haunts of fish, deer and partridge, whose short harvest time of three months entitles them to their charge of three dollars a day.

We realized at once on arrival why so many of our friends of the Middle West betook themselves to Wisconsin's wilds, and that, instead of needing extra fortitude to withstand the hardships of the wilderness, we were on the lines of travel, with good accommodations. The conditions are much the same as one finds on the banks of Newfoundland, on the Passamaquaddy, or off Biddeford Pool, except that the catching of muscallonge, bass and pike of the northern Middle States produces sensations of stirring delights of contention much more acute than the slow cod and haddock of the East, where the fish are pulled in by a heavy hand-line run over a roller at the vessel's side.

The most central place and the best for outfitting is Minocqua. Upon the banks of the lake the many beautiful homes, picturesquely set in this new country, where the log-cabin, so typical of American pioneer life, is still the accepted mode of house construction. The bountiful forests supply saplings for the rough and ready dwellings, while at the village there are good hotel accommodations. A sportsman inclined to be sociable will find pleasant men among the cottagers and the tourists who delight in days by the streams and camp fires. They are

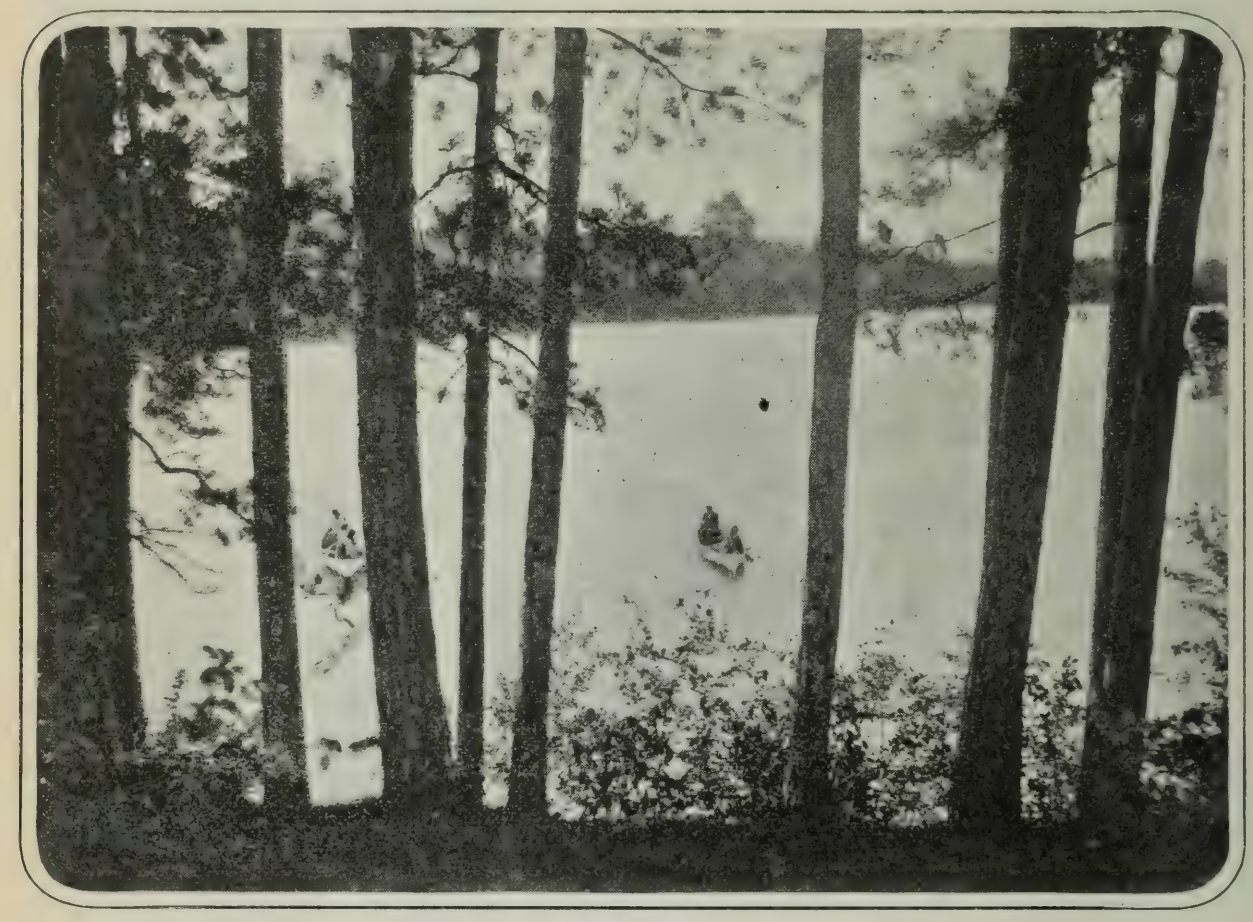
often the pick of the fishermen of the Middle West, who know where to find fish to a certainty and are continually proving that "fishing" is one thing, while "catching fish" is another. In passing through the woods one comes across whole settlements of logging camps, long disused, with old dams falling into ruin, wind-brakes and corduroy roads, while the deer runways and bear trails give the traveler the feeling of the untamed wilderness, little changed by the lumbermen or even by these later, more polite *voyageurs* of the teeming waters.

It is a place that serves annually as evidence of the duties the State owes to all its living creatures and of the manner in which nature will respond to man's care of her welfare. The State of Wisconsin has established a hatchery for muscallonge, bass, lake trout, pike and white-fish at the head of Lake Minocqua, from which the surrounding lakes are supplied, to make food and sport for the anglers. The muscallonge is a difficult fish to hatch, handle and raise, only about fifty per cent. of the eggs being productive of healthy fish, while with spawn of pike some seventy-five per cent. are hatched and grown.

During the early spring men well posted on the haunts of the fish are sent to gather in quantities the grown females and males. They select the females best adapted for the purpose and take from them the spawn, or eggs, while from the male fish the milt is obtained. The fish are returned to the water. The eggs are placed in peculiarly shaped jars, about six inches in diameter at the top and fifteen inches long, sloping toward the bottom. Here they remain, the lake water continually running in and out of the top in a small stream, until they hatch; and, as they do so, they rise and run off with the overflow into troughs, where they are allowed to remain until they have grown to a sufficient size to ship to different lakes.

Thus it is with muscallonge and pike, but not so with bass. It has been found impossible to take the spawn from bass. Large pens, or reservoirs, are built, with banks of soil. At intervals of some ten feet in each direction are placed nests, made of boards, four feet long and eight

A Typical Cottage in a Niche in the Woods, Costing Less than $100; Dimensions 12 Feet by 16 Feet.



Cedar Falls, on Cedar River, Eighteen Miles from Minocqua, Wisconsin.—Catching bass as fast as one can handle them

inches in width, nailed together in the form of a trough or drain, one side being left open. The nests are placed perpendicularly and are partially filled with gravel. The bass, caught with line and hook, are put in the ponds to spawn. The mother fish soon finds the more secluded portion within the nest, burrows an exactly round cavity and lays her eggs. As soon as they are laid, or just before they are ready to hatch, the employees draw a piece of cheese cloth around the entire nest, so that there is no possibility of injury or of escape for the fry, which are put into a trough, there to remain until they are large enough to ship.

Opinions vary as to the best methods of taking the three principal game fish—the muscallonge, pike and bass. City anglers expatiate upon the alluring qualities of frogs; others advise passionately the silver minnow, or "shiner," and still others prefer a fly. But twenty-five years' experience with the men who know every nook and corner of the grounds, who know the habits of the fish, who net them in the spring for the State's use, goes to show that a No. 6 or a No. 7 Skinner spoon, trolled with moderate speed over the haunts of the muscallonge, has a witchery that is irresistible to the most self-satisfied of the giants. The best outfit is a Bristol steel rod, in two joints, of three and a half feet each; a good reel—Louisville preferred—to hold braided silk line of forty pounds breaking strength, five hundred feet or more in length; a large reel, three times the size of those ordinarily seen; half a dozen Skinner trolling spoons—about No. 6—and a gaff, with a handle two feet long and a large size cod hook in the end, made of ¼-inch steel, with a shank at least eight inches long. With these tools the true Wisconsin expert masters the largest inland fish. They are ample for the luring and the conquering of the mighty muscallonge, altho he frequently weighs twenty-five pounds and sometimes forty pounds. One, which marked the maximum, was about five feet in length and eight inches in diameter in the thickest part.

The fish most sought—and most plentiful in the interior lakes—is the bass, the

black large mouth and the small mouth. For bass a proper selection of the ground is absolutely necessary. It should be chosen adjacent to some submerged logs, or tree tops fallen in the water, or within twenty-five feet of lily pads, in ten or twelve feet of water. The line should be baited with a dark backed "mud minnow," of which bass are particularly fond. Blessed little beasts, these minnows of the lakes, for they will live for days in the same half pail of water without change—a fisherman's luck that is strangely true, and very convenient. The bass average from three and one-half to four pounds. I knew of one catch which weighed one hundred and two pounds to twenty-four fish of the large mouth variety.

Bass Fishermen on Twin Lakes

The bass call for a rather stiff bamboo pole, about six feet in length, in two joints; an ordinary reel carrying one hundred feet of braided line, and a landing net fully fifteen inches in diameter. They are caught by "still fishing," and not by casting. No casting is done except in the early spring, when the fish go up the rivers to spawn. It is lazy man's work, sitting in a boat in a high-backed chair, with cushions in plenty, good cigars and what not, unless the fish are biting with their usual avidity. Then they demand all a man's energy and quickness.

Many people think fishing for brook trout an expensive amusement—the rich man's sport. The reverse is the truth, in Wisconsin at least. I have known one of the most successful trout fishers to start for the streams with three flies and a fine braided short silk line in his inside pocket, cutting the limb of a sapling for a pole, and returning in less than an hour with two dozen fine trout.

The streams, as a rule shallow and narrow, are lined with thick underbrush and bushes, where a six-foot pole is of little use. In some few localities, however, wading is necessary, and the streams are wide, with plenty of room for casting. The waters the trout frequent, farther north than Lake Minocqua, are from cold springs; and, as the seasons are so backward in Northern Wisconsin, the best time to fish for trout is in July and August, when the fish are fully alive to the dancing midges.

The wall-eyed pike frequent deeper

Disciples of Izaak Walton Bass Fishing on Lake Minocqua

water, from twenty to thirty feet, and are caught "still fishing," in the same manner and with the same bait as bass. They run in schools, one impressive evidence being one hundred and two pounds of pike caught with three lines within two hours, early in July. They averaged eight pounds, and some of them were nearly fifteen pounds. That noble catch was made in Gunlock and Fence Lakes, near Minocqua, in Northern Central Wisconsin, and undoubtedly came from some small fry put in by the hatchery a few years ago.

On the ordinary shallow lakes, easy of access, where but few fish are found owing to the accessibility of the grounds, and where the few remaining fish have no cover but the lily pads, I have seen the frog used as bait for casting; but in lakes and rivers, where fish are plenty, and where they are fished for by skilled men, I have never seen a cast made or a frog used, except early in the spring, when the fish are in shallow water previous to spawning.

These three tribes of fish are a provoking lot. They may be plenty and yet refuse to strike for days at a time—a prolonged Fast of the Ramadan, most trying to the waiting angler whose vacation is nearing its end. And joyous he is when they return to their voracity and bite for days consecutively.

OAK PARK, ILLS.

My Fox Terrier

BY HARRY W. FRENCH

A LITTLE demon, in defense;
Brave as a lion he.
I wish I had the courage
Of this atom on my knee.

A little universe of love;
Unselfish as the sea.
I wish I did by others
As he has done by me.

A little lump of loyalty
No power could turn from me.
I wish I had a heart as true;
From fear and favor free.

A little fountain full of Faith,
Forgiveness, Charity.
I wish I had his patience
And true nobility.

A little flash of fire and life,
Whate'er the summons be.
I wish that I could face the world
With half his energy.

A little white Fox-terrier,
In whose brown eyes I see
The little windows of a soul
Too large to live in me.

BOSTON, MASS.

Archeology in Crete

BY EDITH HALL

[Miss Hall is one of the students at the American School of Classical Studies at Athens, Greece, where she holds two scholarships. During the past few months she has had the privilege of excavating in Crete with Miss Harriet Boyd, the American archeologist, who has already won great success in this field of work.—EDITOR.]

THE spade is busy again in Crete. The Italians at Phaestos, on the southern coast (not far from the site of St. Paul's shipwreck); the English at Knossos, three miles from Candia, and at Palaikastro in the East, and the Americans at Gournia, on the Gulf of Mirabello, have renewed their work of laying bare the relics of the Mycenean civilization of the island. Already, in four years of their excavations, an upper room in the abandoned Turkish barracks at Candia has been filled with rows of cases, for any one of which the great museums of the world would pay a goodly sum. To judge by this rate of finds there is every reason to believe that this spring's campaign from March till June will add to important contributions and crowd the little museum still more closely with pottery and bronze and stone implements which tell the tale for him who has eyes to read it of the days of long ago, fifteen hundred years before Christ.

To learn exactly what the season is bringing forth one should travel by horse over the Turkish cobblestone roads, keeping up his archeological enthusiasm by occasional gallops through olive orchards, or on the beach, and should spend a day at each site where excavations are going on. Perhaps the visitor will have the good fortune to be invited to luncheon to the house of the excavator, and if his chair is opposite the shelves of portable finds, he will have the chance to see for himself what the new possessions of the museum will be, and whether they will throw light on the much vexed question of who the Myceneans were. At least, he will find his host not too busy to show him the excavations and to explain what is being done.

At Knossos he will find Mr. Evans employing only a small squad of men on the great Mycenean palace, which is now practically cleared, and which has already become famous with its shining gypsum floors, its plaster frescoes (now in the museum), its large elaborate drainage system, its baths, its dungeons for prisoners, its olive press, and all the rest of its appliances, even to the "chess-board," all of which is down in the books for him who loves archeology. The main force of workmen are digging out a tomb situated nearly a mile from the palace and commanding a lovely view of the minarets of Candia and the island of Dia beyond. The tomb consists of a passage, or dromos, and a rectangular gable-roofed chamber, into which it leads. The shape of the chamber is noteworthy for the contrast it presents to the beehive tombs of Greece. Unfortunately, the tomb had been plundered and many of its squared stones carried away for building purposes. There is accordingly little hope of finding either gold ornaments or pottery.

Between the tomb and the palace there have been opened as many as seventy graves cut into the soft rock of the hill. Grave-hunting has become a profession in itself. Mr. Evans's overseer has hunted graves for forty years, and has learned to detect them by the presence of a long-rooted plant. If he sees this plant growing in what he knows to be a shallow depth of soil, he suspects a grave beneath, and makes a trial dig. The first of the graves were discovered early in March, and it was hoped that they would prove to be the great cemetery of the owners of the Knossos palace, and rival the shaft graves of Mycenea. But with the exception of a few bronze swords and plain clay ossuaries, they were signally unproductive. A rich cemetery of the Knossos lords is still to be found.

In Eastern Crete the visitor will be chiefly interested in the bronze and stone tools, which Miss Boyd continues to find at Gournia, and in the Palaikastro pot-

tery, which is notable for its combination of the two technics of vase-painting, of light paint on dark ground, and dark paint on light ground.

So far this year, however, all the finds from Knossos, Palaikastro and Gournia will, taken together, hardly compare in importance with the fragments of a black steatite vase which Mr. Halbherr has found at Agia Triada. The small palace which has been uncovered there is thought to be a country house of some rich Mycenean lord, perhaps of the king himself, when he tired of his larger Phaestos palace, an hour's ride to the East. It was accordingly expected that the finds here would be of unusually good technic and style, and yet archeologists were hardly prepared for the remarkable steatite vase, which Mr. Halbherr found there years ago, on the shoulder of which is carved in relief a procession of singing harvesters, or, as others think, of soldiers. Last year a delicate bowl with three figures in relief was found. It attracted the attention and admiration of those who saw it in the museum this winter, because it shows a new type of Mycenean shield, and because one figure is so beautifully carved that it may fairly be said to foretell the bloom (was it a renascence?) of Greek art, a thousand years later. Toward the end of last season's campaign, as late as August, when other archeologists had sought cooler climates, Mr. Halbherr

The So-called Warrior Vase, Excavated Near Phaestos, Crete. The material of the vase is steatite. The figures are in relief, and form a procession, half of which is represented in the illustrations. This vase is a wonderful example of the art of the period—*i.e.*, about 1500 B. C.

found fragments of a third steatite vase, carved with scenes of a bull-hunt. Early this spring he was so fortunate as to get several other fragments, so that the vase, which has already been brought to the museum, has been in great part restored.

It is of the filler shape—*i.e.*, a cone with its end cut off, and is a little more than a foot high. Its ornamentation is divided into four zones, three of which show scenes of fighting, while the fourth has to do with the bull-hunt. The helmets worn by the fighters are remarkably like the classical Greek helmet. The other pieces of armor, faithfully and clearly depicted, will be of great use to students of Homeric armor. The bulls, especially one with upraised head tossing a man in air, are treated with a skill and vigor which recall the Vaphio gold cups, and it is safe to say that the new vase does not suffer in the comparison with those lovely masterpieces of the Mycenean goldsmith.

These three steatite vases have revealed a new page in the history of Mycenean art. While the soil of Crete still contains such treasures, it is no wonder that scholars are turning excavators. Theories may well wait till the evidence is in. In the meantime the prestige of the Candia museum is growing with every year's acquisitions. Plans have already been accepted for a new building which will properly house its possessions, and more visitors study its unique collection each succeeding year.

CANDIA, CRETE

Arbitration, Conciliation, Trade Agreement

BY JOHN R. COMMONS

[All students of social problems will be glad to know that funds have been subscribed to the amount of at least $30,000 for the preparation of a "History of Industrial Democracy in the United States." Professor Ely, of the University of Wisconsin, will have charge of the work, and his chief collaborator will be John R. Commons, who has contributed some of the most valuable articles, signed and unsigned, on industrial conditions published in THE INDEPENDENT, and who has just been made Professor of Political Economy in the University of Wisconsin to enable him to take part in the production of this work. Professor Commons, until he accepted this call, was the statistician of the National Civic Federation. In the following article he seems to point out a really practicable solution of the labor problem, if there be a solution In our opinion Professor Commons knows more that is true about the mutual relations of capital and labor than any man in the United States.—EDITOR.]

IN this article the word arbitration is used to mean a decision by an umpire or board of disinterested outsiders.

By conciliation is meant the good offices of disinterested parties in bringing together the representatives of the contestants and helping them to reach an agreement without, however, making a decision.

By trade agreement is meant an agreement between the representaives of the interested parties to govern future work and wages.

These definitions are given to begin with because it is expected to show that arbitration, in the proper sense of the term, is a makeshift and a sign of weakness; that only imperfectly does it establish justice or guarantee peace; that it has been abandoned or limited wherever the parties have had experience with it, and that the true solution of the problem of organized labor and capital is the trade agreement.

First, the distinction should be drawn between making a trade agreement and interpreting an existing agreement. A trade agreement lays down rules and regulations for the guidance of all indi-

viduals who accept its terms. It is an act of legislation wherein the different parties come together and work out an adjustment of their more or less conflicting interests. Such legislation will always be indefinite on some points of detail and will not cover all of the conflicting interests that may arise. When such a case occurs it requires interpretation, but this interpretation is simply a statement of what it is believed the agreement itself would have stated had the case been brought up when the agreement was made. If the parties themselves cannot agree on this interpretation, they call in an arbitrator, and the arbitrator's task is comparatively a simple one, for he has the agreement before him as a guide. In discussing the proper place of arbitration I refer less to this strictly judicial field than to its use in the legislative field of the trade agreement. Yet, even in the field of interpretaion it has been found that the arbitrator is seldom needed. A board of conference or concilation, sometimes inexactly called an "arbitration board," composed of representatives of both sides, can usually agree upon an interpretation, and it is no unusual thing to learn of an agreement system like that of the stove founders, the bricklayers, the mine workers and others, in which, in the course of five, ten or twenty years the conferees have never, or at most only once or twice, called in an umpire. Setting aside, then, the minor question of the interpretation of an existing agreement, we come to the main question of the trade agreement.

Consider, first, the probability that a trade agreement will be faithfully enforced compared with the probability that an arbitration award will be enforced. A trade agreement is a contract between two associations drawn up by their representatives. An arbitration award is also a contract, but it is drawn up by an outsider irresponsible for its enforcement. Now, fidelity to contracts is the first essential to a renewal and continuance of contracts. But in our American jurisprudence there is no authority that compels the parties to observe either a trade agreement or an arbitration award. It is not a contract in law—it is only an understanding. Its observance depends solely upon the self-interest and the honor of the parties. Which of the two kinds of contract will appeal more strongly to this self-interest and this honor?

A trade agreement is a contract accepted and signed by the representatives after all its terms have been fully discussed and understood. But an arbitration award is a contract accepted and signed in the dark before either party knows what he is binding himself to do. It stands to reason that every representative who has had a voice in making the agreement, and then accepts it with his eyes open, will feel more keenly his personal obligation in having that agreement faithfully obeyed, than he will when he can disclaim personal responsibility for any unsavory terms of the agreement. The representatives who sign the agreement are the most influential and respected of the members of the two associations. They nearly always include, moreover, the executive officers of those associations whose duty it is to enforce the contract on any recalcitrant members. These officers are certain to be more independent in forcing obedience when they know that they have the backing of the strongest representatives of the rank and file.

For this reason a trade agreement should always be made by as large a body of representatives as can possibly be admitted to the conference. The Interstate Conference of the bituminous coal industry seems an expensive affair, with its 500 mine workers and 100 operators, and the detailed work is actually done by a small committee. But every one of these delegates realizes, as he could in no other way, the impossibility of getting a settlement that will suit everybody, and he goes back to his local a missionary to explain the agreement and to show why it is the best that could be obtained. The expense of these delegates is but a small price to pay for the enormous educational results of this contact with the operators and their influence with the locals. For in the observance of an agreement neither the leaders of the men nor the leaders of the employers can be most successful unless they have their constituents educated up to the conditions of the industry and the strength of the opposition. If these negotiations were conducted by only a small number of the executive officers the opportunity

would be open for charges of undue pressure, secret understandings or ignorance of local conditions, and the result would be dissatisfaction and difficulty in enforcing the agreement. But with a large and representative committee on each side, the prospects of effective enforcement are greatly improved. The trade agreement, therefore, when the proper machinery is adopted for drawing it up, much more than an arbitrator's award, is likely to be observed faithfully and renewed peacefully.

This is emphasized by the difference in attitude of the two parties when they appear before an arbitrator and when they meet to make an agreement. It is all the difference between arguing a suit in court and settling it out of court. In the court proceedings each side takes advantage of every point, makes no concessions and becomes generally belligerent and unconciliatory. By meeting out of court any liberality or concession on one side is likely to induce similar liberality on the other side. Appeals are made to the spirit of equity and fairness, and it is only as this spirit of equity is cultivated that a permanent solution can be found. A decision reached in any other way leaves a bad taste and rankles in the breast, and must be decided over and over again on the occasion of any petty dispute, with always the imminent danger of outbreak and defiance.

When the stove founders and the molders adopted their agreement system they debated long and earnestly on this subject, and finally decided to have no arbitration even on questions of interpretation. Mr. Castle, one of the participants, in speaking of this debate, relates that " the question was asked of one who was most strenuous for arbitration, 'Would you, if a member of an arbitration committee, representing your side, concede anything of importance, even if you became convinced it was right to do so?' and his reply was 'No; I should feel obliged to win, if possible, through the odd man.' "

The word " arbitration " makes a sentimental appeal, because it seems to call for justice between man and man. But it is doubtful whether an arbitrator can possibly satisfy even himself as to what is justice in a given dispute. The conditions are too complicated and he has no rules for his guidance. See what the arbitrator must take into account: He cannot, of course, determine what share labor produces and what share capital produces of the joint product, for he gets no help, for example, from the socialist, who holds that labor produces the whole product, nor from the economist, who holds that each produces what he actually gets. Abandoning this search, suppose he tries to discover what are fair profits and fair wages? Here he meets two kinds of problems, one that of wages and hours, and the other that of rules and regulations. Wages and hours are by far the simpler of the two, yet consider what a just decision involves. The arbitrator must first decide whether the industry can afford to pay the increase. To do this he must decide what is a fair rate of profit. Shall it be 5 per cent. or 10 per cent. or 15 per cent.? This is a matter upon which no two persons will agree if their interests clash. But even after this is decided, he must decide whether that rate of profit shall be earned on the par value or on the market value of the stock and bonds, or on the actual investment, or on the cost of reproduction, and whether good will shall be entitled to profits as well as tangible capital. If he decides in favor of the actual investment or cost of reproduction, he must have the help of an accountant and an engineer, or a purchasing agent, to discover what has been the actual investment, or would be the cost of reproduction. After determining all these essential points he finds that his work is useless because the profits of different employers are not the same, and some of them are already on the verge of bankruptcy, so that if their expenses are increased they must get out of business. Finally, the arbitrator cannot take into account the possibility of the employer being able to shift the increase over to the public through raising the prices of his products, because he does not know the condition of the business. No wonder, therefore, that the Anthracite Coal Commission refused to listen to testimony respecting the ability of the companies to pay the increase of wages demanded. Such would have been a hopeless and endless task, and even if they could have satisfied themselves, which is impossible, they could not have

satisfied either the operators or the workers. They limited their inquiries to determining what would be a fair wage and fair hours of work, leaving to the companies the problem of meeting the increase granted as best they could.

But fair wages and fair hours of work involve another investigation, almost as hopeless as that of fair profits. Whether the cost of living has decreased or increased and how much; whether the wages and hours of similar labor in other fields should be taken as a standard; whether hardships and dangers reduce the trade life of the workman; whether employment is steady or interrupted; whether luxuries, comforts, leisure and the fruits of civilization are included in the standard of living—it only needs a statement of these vital questions to show how impossible is their answer from the standpoint of justice. The arbitrator looks about for something more definite. He finds nothing but the demands and the counter-demands. The workmen ask an increase of 20 per cent. in wages and eight hours. The employers ask existing wages and ten hours. Here is something definite, and since both cannot be right, and each appears to be right, the arbitrator can usually do nothing but split the difference. So frequent and unsatisfactory has been this experience with arbitrators that they are avoided wherever possible, and the English agreements generally require the arbitrator to decide " yes " or " no," as in a court of law, without trying to satisfy both parties.

So much for wages and hours. When it comes to the rules and regulations the task of the arbitrator is even more difficult, and his decision sometimes actually brings confusion. In order that he may be disinterested it is usually necessary to select an outsider who is not acquainted with the business. Union rules designed to meet specific evils have, therefore, little significance to him, or he does not understand the way in which they work. No one can appreciate the reasons for these rules who lacks the technical knowledge. A technical man is really required, but he could not be disinterested. The history of the agreement between the International Typographical Union and the American Newspaper Publishers' Association shows clearly this defect, and the recent revision of that agreement is an acknowledgment of the failure of arbitration in so far as rules and regulations are concerned. The revision consists in taking these subjects out of arbitration and leaving them solely to negotiation, first, between the local unions and the local publishers, then, on appeal, between the International Union and the commissioner and general committee of the publishers. There are left to the arbitrator only the questions of wages and hours, and of such local rules as directly affect hours and wages. This experience in the newspaper business bears out the experience in all trades where arbitration has been tried.

Besides rules and regulations there are certain questions of policy and expediency, which are not subject to arbitration and must be settled by negotiation. Among these the largest is the union *vs.* the open shop. When this subject was submitted by the Typographical Union and the Typothetæ to Mr. Seth Low some years ago, he refused to pass upon it. He said, in explanation, that " this is a question ordinarily decided by power. If the union is strong enough to carry its point an office is made a card office. If the employer is strong enough to maintain his position, he declines to have his office made a card office. No arbitrator," he said, " could find that an employer should be constrained against his will to shut his office either to union men or to non-union men." If that question is not to be decided by arbitration, then, of course, one of the important causes of strikes and lockouts must be handled salely through the trade agreement. And, indeed, this is the only proper solution, for the question is one of expediency and mutual advantage, to be determined by experience and good judgment. Whether the union can and will provide greater security and other advantages to the employer through the closed shop than through the open shop is a question solely for the employer to decide under the circumstances. It involves questions too large for arbitration, such as the character of the union and its leaders, its record as a business organization, its observance of agreements, its policy on sympathetic strikes, its control of the supply of competent mechanics, its terms of admission and apprenticeship, and its modes

of discipline. In these respects unions differ widely, and the same union is continually changing, so that there is no constant standard to guide the arbitrator. The question is wholly one of the balance of advantage, and if it cannot be settled by negotiation and conciliation, it cannot be settled at all.

It is plain from the foregoing observations that arbitration, in the correct sense of the term—*i.e.*, an award by an umpire or distinterested board of outsiders—is a makeshift in that it does not enlist the hearty support of both sides in its enforcement, while it tends to confuse the rules and regulations of the trade, fails to establish justice in the matter of wages, and cannot even be invoked in matters of policy and expediency.

We can learn a lesson on this subject from the experience in England, where the unions are older, and there is no more convincing account of the dissatisfaction occasioned by arbitration than that to be found in the chapter on that subject by Mr. and Mrs. Webb in their book on "Industrial Democracy." From the year 1850 to 1876 trade unionists persistently strove for arbitration, but since that time, altho arbitration has risen in popularity with the public, the two combatants have seldom shown any alacrity in seeking it, and they "can rarely be persuaded to agree to refer their quarrel to any outside authority" (p. 224).

It is not maintained that arbitration can be wholly and everywhere displaced by the trade agreement and the conference board. It is, perhaps, well enough to provide for an umpire in matters of interpretation in order that a deadlock may not continue too long. And if it is considered desirable to bind the parties to an arbitration system for a period as long as five years, as is done in the newspaper business, it seems also necessary to provide for an arbitrator on questions of wages and hours. But if we reduce the matter into its simplest terms we shall probably find that the occasions when it is necessary to fall back on an arbitration proper are the following:

1. When a representative of either side does not want to face his constituency in making a concession.

2. When a new union or a new employers' association, inflated by a novel feeling of strength, finds itself unexpectedly against a hard reality, and looks about for a way out.

3. When the parties have agreed between themselves on all points, except one or two, and these have been reduced to such simple and untechnical terms that any person of integrity and intelligence can give a decision.

4. When the public is so seriously damaged that it practically forces the contestants to submit to outside interference.

In mentioning these cases and contingencies, which seem to call for arbitration, it will be seen that the resort to the arbitrator is a sign that the parties are not well organized, and therefore are inexperienced, or that the representatives are afraid of their constituents, or that the industry is a public utility. It may well be argued that in the case of a public utility arbitration is necessary; but, if that is so, it is because the rights of the public become paramount and the parties must subordinate their business to public control. If this is conceded there is no half-way measure short of making arbitration compulsory or legal, not, however, as a means of securing justice between the parties, but as a means of securing peace. In other cases the public can wait until the time when, through the better acquaintanceship and confidence promoted by the trade agreement, the arbitrator will gradually fade into the background.

New York City.

Literature

Novels, Japanese and Japanned*

As a help to the understanding of Japanese character and difficulties there is no book that takes the place that Tokutomi's novel in its English translation is likely to fill. The story was published in Japan for Japanese readers about four years ago, and is what we should call in English a "problem novel." While we seriously question the good taste of so open an exploitation for purposes of fiction of the Tokyo gossip in connection with the sorrows and difficulties of prominent persons now living in Japan, who can be readily identified under the changed names used in the book, this objection does not extend to its circulation in America, where the characters and events are alike unknown to the readers. Considering the novel, then, simply on its merits as a story of Japanese life and character, it opens a window for us through which we can see the very minds of our neighbors across the Pacific.

One of the curious things about modern Japan is the moral awakening that has come through the holding up of the light of Christian standards to the old customs of the land. Little by little both laws and public opinion in regard to the family relation are changing, and even now the circumstances that hastened the end of the unhappy Nami-Ko would be no longer possible. The sending home of a wife beloved by her husband at the whim of her mother-in-law was a thing happily rare, we believe, even in Old Japan, but the possibility of such things has been for a thousand years or more the curse of Japanese home life, and it is a great thing for the nation that under the new code a divorce without the consent of both husband and wife can only be obtained through the courts.

Of all the important characters in the story, none seems more admirable or better drawn than General Kataoka, the father of the unhappy heroine. Little Nami-Ko, with her quiet ways, her sad home life, her love for her husband, and her untimely end, is more vague—perhaps because lack of individuality is regarded by Japanese men as the ideal to be sought by the well-bred Japanese woman. Takeo, the hero, is the ancient samurai brought down to date. In his code of morals obedience to his mother and his duty as head of the family rank higher than his duty to his beloved and suffering wife, and it is through the conflict of these duties and affections that his character is brought out by his creator.

The setting of the book is Japan itself. From the first chapter in Ikao, where the young couple are introduced on their bridal tour, to the sad close at Aoyama cemetery, where the old General and his whilom son-in-law weep together over Nami-Ko's grave, the atmosphere is complete, all-surrounding. The reader is in New Japan; thinks its thoughts, conforms to its customs, fights its battles and understands its perplexities.

As is the japanned tea-caddy in your kitchen to the lacquered box in the collector's cabinet, so is *The Daughters of Nijo* to Tokutomi's novel. If it were not that to a great many persons Mrs. Babcock's work seems a true picture of Japanese life, it would be hardly worth while to review it seriously, so many and so glaring are its errors. There is nothing Japanese about it save a few words, usually misspelled and wrongly used. The story which we are at present considering begins somewhere before 1867, for we are expressly told that "the country was torn with the dissensions of Imperialist and Bakufu," a state of affairs that ended with the resignation of the Shogun in that year; but the young girl born a year later is still a child at the time of the death of the Empress Dowager in 1897. As the Crown Prince was married in 1899, the action of the story from Chapter II to the end necessarily belongs to the period between those two dates, a time so recent that names and facts are easily verified, and the novel-

* NAMI-KO. *By Kenjiro Tokutomi. Translated from the Japanese by Sakae Shioya and E. F. Edgett.* Boston: H. B. Turner & Co. $1.50.
DAUGHTERS OF NIJO. *By "Onoto Watanna."* New York: The Macmillan Co. $1.50.

ist who deals with it should pre-suppose a certain intelligence on the part of her reader.

This is what Mrs. Babcock does not do. Her description of life at the present Japanese court comes as near to the facts as do the "shilling shockers" or the "penny dreadfuls" to an understanding of the ways of the British aristocracy. The Emperor, on his knees beside his mother's death-bed, is a beautiful creation; but the Empress Dowager was not the Emperor's mother, she was only his father's wife, and his own mother is still living, or was a year or two ago. A Princess addressing her servant as "honorable maid" would be something of an anomaly, even in the land of honorifics. Sado-ko's relations with her grandmother, the Empress Dowager, are of a free-and-easy type not belonging properly to "the ancient style to which her grandmother still clung." And that any Imperial Princess, brought up under the old *régime*, should ever find herself sufficiently free from surveillance to chase butterflies about the garden all alone, and flirt with audacious boys who might climb over the wall and pelt her with cherries from the tops of trees, is a flight of imagination quite beyond the Japanese grasp. That the cherry trees of Japan bear no fruit is a minor fact overlooked by our author.

But perhaps Mrs. Babcock is not to be blamed for not knowing more of court life. All who live in Japan cannot consort with the nobility. Let us see what she can do in giving us the atmosphere that hovers over humbler circles. Her young farmer's wife, for instance, is badly instructed in the first duty of the Japanese peasant, when, after hastily dismounting from her kuruma at the approach of Prince Nijo's train, she climbs a hillock above the road that she may look down on the procession. Even foreigners learn before they have been long in Japan that no one is allowed to look down from above at the comings and goings of his betters, and in the stormy times before 1867 such temerity on the part of a young peasant woman would have been more likely to result in her ruthless destruction by the swords of the samurai than in her capture and conveyance to Kyoto in the princely palanquin.

Even in so small a matter as the washing of a dog in Japan there is a right way and a wrong way, and the way described on page 60 is quite the wrong way from the Japanese point of view. The housewife herself was washing the dog, and when her daughter informed her severely that the animal was clean enough, the obedient mother let him go and "he darted about the veranda for a moment, shaking his still wet little body, then rushed through the shoji indoors, disappearing under a mat over a warm hibachi." A wet dog is the last thing that a Japanese of any social class will allow either on the veranda or on the floor mats, for the family must walk in stocking feet, and sit in nice dresses, and eat from flat trays on this very floor. As for the dog's "rushing through the shoji"—that is, the paper screen that serves as a window—no Japanese housewife would think of allowing such a liberty on the part of a dog, and its immediate sequel would be a rush for paper and paste to mend the break, and not "a morning gossip with Masago" or anybody else.

The geography of the story is as bewildering as are the ways of the characters. Kamakura is made a suburb of Tokyo, and the Aoyama Palace, the home of the Empress Dowager, is, by the magic of the story-teller, moved from Tokyo to Kamakura and adorned with gilded towers and spires. As a matter of fact, the Aoyama Palace is a rather ramshackle old building, with none of the graces of architecture here attributed to it. Again, "The palace Nijo, the resort of West-desiring nobility and court, was possibly the oddest, if most expensive, residence in Tokyo. Originally it had been a Yashiki of the Daimio of Mito." Any one with a copy of Murray's Hand-Book of Japan ought to do better than this in laying the scene for a story. Nijo Palace is in Kyoto, Mito Yashiki is in Tokyo, and this violent mixing of the two together would be quite likely to produce "the oddest if most expensive residence in Tokyo," especially as the Mito Yashiki is at present the site of the great arsenal where Japan's newest firearms are made.

As to Mrs. Babcock's knowledge of the Japanese language, there is little to be said. Her use of words is inexact, her spelling far from the accepted standard. Some of the names are real, as that of

Prince Komatsu; some are slightly misspelled, as Ohano, which is probably meant for Hana, with the honorific before it, and Sado-ko, which seems to be a wrong spelling of Sada, the name of the Crown Princess of Japan, with the Ko after it that shows that the name is that of a woman. We are at a loss to discover the etymology of Masago until we find, on page 158, that the hero, Junzo, translates it "morning-glory," and then we known that "asagao" has somehow got twisted into Masago in its voyage across the Pacific. Kwannon (spelt Kuonnon by our author), the Buddhist Goddess of Mercy, seems to be confused with Amaterasu, the Shinto Sun Goddess, ancestress of the Imperial line.

But the time would fail us to tell of all the strange little errors that rear their heads here and there throughout the book—errors so slight, so subtle, yet so convincing, that by internal evidence alone we should judge that the "Daughters of Nijo" had been written by one who had not even an intelligent globe-trotter's knowledge of Japan.

Culture or Anarchy

THE volume which we shall attempt to discuss under this borrowed but appropriate title consists of "six papers read before the National Educational Association, at the sessions held in Boston, July 6th and 7th, 1903," on liberal education and the length of the college course.* The speech of the occasion appears to have been President Eliot's "A New Definition of the Cultivated Man," wherein he purposes to show that the ideal of culture has undergone a change. As far as we can see this change is essentially identical with that of which we recently spoke in reviewing Professor Beers's "Points at Issue." According to the older conception of culture the main thing is the formation of correct moral ideas—that is, of perfectly clear and sound ideas about the significance of human life and conduct. For this ideal President Eliot proposes to substitute a certain amount of positive knowledge and a certain amount of skill in its practical application. In short, the new culture is to consist mainly in an ability to do. Very well. We do not deny that such a change is taking place; the question is whether it is really desirable—is it for the best? To discuss the question in this particular place seems beyond our competency; the singular thing is that President Eliot should have neglected to do so, as he did presumably on the assumption that "whatever is, is right," and that to establish the existence of a certain state of affairs is identical with demonstrating its desirability. Under the circumstances the mistake is perhaps a natural one; at least it is the result of a common confusion between moral and scientific ideas, or, in other words, between nature and human nature. In the physical world to show that a certain condition exists is precisely to show its necessity, and the question of desirability is purely irrelevant. In the province of morals, however, the establishment of a condition does not imply even a necessity, much less confer a sanction.

Now, President Eliot prefers, for example, the study of current events as reported in the newspapers to the study of history. And upon the fancied objector who would reply that "the stream of the world is foul" he retorts that the Greek tragedies, tho "means of culture," are "full of incest, murder and human sacrifices to lustful and revengeful gods." Is it not a startling, a painful illustration of the weakness of the moral sense among us that a man of this eminence, speaking upon a matter so important, should not see the difference between a disorderly jumble of facts and a great work of literature presided over and controlled by a distinct moral idea? And yet he insists that "character [is] a more important element than it used to be in the ideal of a cultivated man." After these remarks it will astonish no one to read the following plea for the study of literature.

"When we ask ourselves why a knowledge of literature seems indispensable to the ordinary idea of cultivation, we find no answer except this: that in literature are portrayed all human passions, desires, and aspirations, and that acquaintance with these human feelings and with the means of portraying them seems to us essential to culture. These human qualities and powers are also the commonest ground of interesting human intercourse, and therefore literary knowledge exalts the quality and enhances the enjoyment of human intercourse."

* PRESENT COLLEGE QUESTIONS. *By Chas. W. Eliot, Andrew F. West, Wm. R. Harper, and Nicholas M. Butler.* New York: D. Appleton & Co. $1.00

Now science holds a very high place in the modern idea of education, and justly, because it aids in the formation of correct moral ideas by determining in a large measure man's relations to the universe. Its position, however, is definitely understood; it is in no danger. But if no better reasons can be found for the study of literature than that it seems indispensable because it seems essential and that it affords a pleasant subject of conversation, how long, we wonder, is it likely to retain its influence or even its place? Under these circumstances the question in which President Eliot sums up the purely negative results of his address seems of melancholy and ominous augury for the immediate future of education:

"On the other hand, is there any single acquisition or faculty which is essential to culture, except indeed a reasonably accurate and refined use of the mother tongue?"

Of the following address by the Dean of Princeton's Graduate School we can, unfortunately, take no more than passing notice. It is in substance what its name imports, a review of the "Perils to Liberal Education," from "the common defects of our American civilization," "from the weaker tendencies in young men," and "from the confusion of counsels inside the college itself." On these topics Dr. West's remarks are excellent, but they hardly go to the root of the matter after all. Matters of elective education and the like are important, to be sure, but they depend entirely upon the ideal of education. Once establish a standard of culture, and these matters will settle themselves. The same remark is applicable to the length of the college course and the papers that deal with the subject. The upshot of the discussion is briefly as follows: If the ideal of education is to be "commercial and utilitarian," it will be desirable and even necesssary to shorten the college course in order that the student may complete his professional courses in time to make a fair start in his profession.

The Duke of Cameron Avenue. By Henry Kitchell Webster. New York: The Macmillan Co. 50 cents.

The political novel is not very old—it might be called a new genus, at least in American literature. The Duke of Cameron Avenue is a political boss, and the story of his fight against Reform in the person of a doughty settlement worker is told with spirit. The style is reminiscent of Jacob Riis's true tales of the fight for Reform in New York.

Juniper Hall. By Constance Hill. Illustrated. London and New York: John Lane. $5.00.

It is interesting to turn from Austin Dobson's delicately appreciative biography of Fanny Burney, which forms the latest volume in the English Men of Letters Series, to Miss Constance Hill's *Juniper Hall,* where Miss Burney, or rather Madame D'Arblay, is again the central figure. Juniper Hall is a quaint old house still standing at Mickleham in Surrey, near to the home of Miss Burney's sister, Mrs. Phillips, and famous as having been in 1792 and 1793 the resort of a party of distinguished French émigrés. Mrs. Phillips's enthusiasm for her charming neighbors was communicated by letter to her sister Fanny, and it is from this lively correspondence and the Burney diaries that Miss Hill gathers most of her information about the Juniper colony. Madame de Staël and Talleyrand, then still a young man, were its most famous members; but General D'Arblay's romantic marriage with Miss Burney makes him of greater prominence in the present narrative. For this "Juniper Hall" is a somewhat misleading title, since the geographical interest of the neighborhood is very limited and the French colony lived there only a few months. Miss Hill has eked out this slender supply of material by harking back in three introductory chapters to the parts played by Madame de Staël and her friends in the tragic summer of 1792, before their flight to England, and devoting the last half of the book to Fanny Burney's marriage,—which took place some months after the dispersal of the Juniper household,—and the life of the D'Arblays in England during the eight years following. But in spite of the discursiveness of the book, its lack of unity and its diffuse, over-sentimental style, *Juniper Hall* contains much that is interesting, and forms an admirable supplement to Mr. Dobson's biography, in which Fanny Burney's married life is passed over very briefly.

The book is handsomely bound and printed in large type, with lavish margins. The illustrations, which are abundant, consist of sketches made in the neighborhood of Mickleham by Miss Ellen G. Hill, and photogravure portraits of the various personages who figure in the text. Among these are several which have never before been reproduced.

Golf for Women. By Genevieve Hecker (Mrs. Charles T. Stout). With a chapter on Impressions of American Golf, by Miss Rhona K. Adair, English and Irish champion. New York: The Baker & Taylor Co.

We have read many dissertations on golf, but this is the first petticoat golf that has come to our notice. Miss Hecker (the links know her only by this name), our National Woman Champion, ought to know how to instruct not only the amateur, but the veteran, and she has succeeded, and succeeded admirably. Most of our books on golf require the assistance of a caddie and a lexicon to be read intelligently. Miss Hecker uses but few technical terms and handles her subject in as masterly a manner as she does her clubs. We have always been told it takes two years to learn to play this royal game for "middle aged duffers," but there are those who agree with the old professional who said, "Well, if your father, and his father before him, were muckle good golfars, and you began as a little child, by the time you were grown up you should play pretty fair." Progress by women in golf has been more pronounced than with men. It is not uncommon now for a woman to make a drive with a carry of over 120 yards, which formerly used to be beyond her drive. Over fifty illustrations add greatly to this book; those describing the grasps are excellent and are true "discourses in golf photography." We make this suggestion, however, a picture of a football player in a dress suit and smooth hair, or a champion swimmer in cap and gown, does not suggest the eternal fitness of things or dress; this applies equally to the author, who appears in evening dress as a frontispiece in her book. We have seen her in a fetching golf outfit and wish that that picture might have adorned her production. Miss Adair has been very gracious in her criticism of American women golfers. She thinks they display a wonderful amount of pluck, particularly in an uphill game, where they are given credit for remarkable cheerfulness when even starting to play with four up and five to play against them. She concedes first place to the American women in driving and believes that they will give her English sisters a good stiff game in the International tournament now being played in England. Miss Adair declares Miss Hecker displays ideal form in playing, and is quite the equal of any woman golfer in the world. We bow to her verdict.

The Shame of the Cities. By Lincoln Steffens. New York: McClure, Phillips & Co. $1.20 net.

This work of Mr. Steffens is one of the utmost importance. It is true, as he himself acknowledges, that it belongs, both in substance and treatment, to journalism and not to social science. No strikingly novel truths have been enunciated, no fundamental principles have been established. It is, in a word, the contribution of a reporter, not of a trained sociologist. But for all that it is, by reason of its graphic presentation of the facts of political corruption and of its insistence on the truth that private business is at the bottom of it all, a book of unquestioned power. It brings home to men's business and bosoms some of the truths about corruption which they should know and remember. There is nothing hesitant or evasive about Mr. Steffens's generalizations. He has pandered to none of the popular prejudices —such as that which holds corruption to be an alien rather than a native product—and he has spared none of the great names and powerful interests that are responsible. As far as he has seen he has reported. The conditions as he found them in Minneapolis, St. Louis, Pittsburg, Philadelphia, Chicago and New York have been set down boldly and clearly where all who have the mind may study them. We hope for this book the widest possible circulation.

Free, Not Bound. By Katrina Trask. New York and London: G. P. Putnam's Sons.

Altho the scenes of this story are laid in New England during the Revolutionary War, the author wisely keeps off the battlefield. The heroine is an English girl married to a young American, and is persecuted by her puritan neighbors for entertaining certain religious "heresies." This shortcoming in theology eventually alienates her from her "deacon" husband as well. But the separation of many months, during which he is campaigning in the American army, heals all bitterness, and reunites them under the happiest circumstances. The story abounds in adventures familiar to every reader of historical novels. But apparently much repetition is required before we weary of the lovely woman with sunburst hair and coral lips, who is invariably captured by the enemy, held prisoner for a couple of days, courted assiduously, then providentially released to the right party just before she capitulates. Some are skeptical enough to wonder what would happen if the real lover or husband was not hurried upon the scene in the nick of time by the breathless author. But, perhaps, it is immoral to speculate upon such a matter. Still the urbanity of the lovely lady to her persecutors tempts conjecture.

Literary Notes

STUDENTS have their share of criticism and counsel. Fleming H. Revell Company has issued a book, by Dr. Henry Van Dyke, entitled "Not in the Curriculum," addressed to students, and full of the wise and genial advice we have learned to expect from the author (Fleming H. Revell Company, New York, 50 cents).

....Ashmore's Manual of Pronunciation (Ginn & Co., 30 cents) is not only useful in schools, for which it is primarily intended, but is a convenient reference book for any one. The pronunciation of over a thousand words is given, according to ten different dictionaries, in such a form that one can see at a glance just what "authority" there is for each variant.

....The old publishing house of D. Appleton & Co. has a new president. William W. Appleton has resigned and Joseph H. Sears has been elected to succeed him. Mr. Appleton becomes chairman of the Board of Directors, and Charles A. and Edward D. Appleton retire from the board. They are succeeded by Mr. Sears and George S. Emory, Mr. Emory being chosen a vice-president.

Pebbles

WE do not see how medical men can tell one germ from another. To us they all look like lobsters with stovepipe hats on.—*Atchison Globe.*

INCREASING CIRCULATION.

"Let us," said the ardent youth
To the journalistic miss;
"Let us," shyly, "go to press,
So that we may print a kiss."

One edition soon was done—
He knew what he was about.
"Our success is fine," he said,
"We must get some extras out!"

—*Judge.*

....The Japanese Anthem.—At a musical evening last week a singer was requested by an extremely sedate looking individual to oblige with the Japanese national anthem. It was explained to him by the serious one that the tune was the same as the British national anthem, and that all he had to do was to pronounce the Japanese words provided for him on a sheet of paper, precisely as they were spelled. Accordingly up rose the willing warbler and burst out with the following lyric:

O wa ta fu lyam.
A fu lyam.

He was only pulled up by roars of delighted laughter from continuing the confession. There was no encore.—*London Globe.*

GOT THE PRIZE.

Edward E. Lee, of Baltimore, manager of a well-known wickerware house, is a fiend after coupon collecting. His friends tell this story on him: He had been collecting all kinds of tags and coupons bearing premiums, for some time, when he one day noticed an advertisement of a New Jersey firm that upon receipt of fifteen of their tags they would forward one chance for a series of prizes, the first prize being a horse and runabout. Mr. Lee began industriously to get all the tags he could find until he had the requisite number, which he forwarded. A few days later he was notified that he had won the first prize. Immediately following this letter came a tiny rocking horse. He sat down and wrote a sarcastic letter to the firm. "I beg to acknowledge receipt of the horse," he wrote, "but you failed to inclose the runabout." In an early mail he received this letter: "*Dear Sir:* We have your letter acknowledging receipt of the horse. As for the runabout, *go chase yourself.* Yours truly, ——— ———." —*Lippincott's.*

Editorials

Lessons of the Slocum Disaster

WHAT are we to learn from this dreadful slaughter of the innocents in New York waters, this disaster that has shocked the civilized world? Here were 1,500 persons, a vast majority of them women and children—the pupils of a Sunday School, with their parents—happily setting forth on a bright June day to enjoy a picnic at a point on the shore of Long Island Sound, only a few miles from their homes. An hour and a half later, 700—possibly 800—of them were dead. They had perished by fire or by drowning in the upper reaches of the East River; not at sea, far from land, but in the tributary waters of our harbor, within sight of the city, almost within touch of the shores between which the steamship was passing. The "General Slocum" was only thirteen years old. She was regarded as one of the best boats of her class. She had been in use for years on excursion routes. Her captain was a man of good reputation and long experience. Official inspectors had recently declared that she was in good condition. And yet this appalling disaster took place.

The Iroquois Theater, a new structure, had passed inspection, and was believed to be under competent management. But investigation showed that the inspection had been dishonest or deplorably lax, that exit doors were locked and barred, that the safety skylight over the stage was fastened tightly by nails and wire, and that there was no adequate apparatus for dealing with fire. The people of Chicago and many other cities gained something after the causes of that disaster had been made known. Investigation compelled reform in many a theater and assembly hall. What ought our people to gain from inquiry as to the awful fate of St. Mark's Sunday School?

Let us see what the facts are, so far as they have been ascertained. The fire started in a cabin or store room where oil and other highly inflammable material had been placed. To this, on that day, a quantity of hay had been added. For this room there was no watchman. Immediately after the discovery of the fire by a deckhand, word was given to an officer. He attempted to use the fire hose, but the hose burst in several places. A piece five feet long, since taken from the wreck, has no rubber in it. It consists of weak canvas, that could stand but little strain. No further attempt to extinguish the fire was made. The crew—only 23 men, officers included, on a boat permitted to carry 2,500 passengers—had not been trained in fighting fire on board ship. None of the six life-boats was lowered; none of the four life-rafts was floated. There is trustworthy testimony that the boats were full of gaping seams; that the rafts were so fastened to the deck by wire cables that men, using all the strength of desperation, could not loosen them.

There were life preservers, so-called, but they were rotten. Filled with granulated cork, instead of cork blocks, and covered with canvas in which holes could be punched with one's finger, they were worse than useless, for they dragged down the bodies to which they were attached. Thirteen years ago they were inspected and approved. The Federal inspector, when asked by the Coroner to tell when the last inspection was made, by advice of counsel declined to say, on the ground that an answer might incriminate him!

Captain Van Schaick drove his boat ahead at full speed for more than three miles, after the fire was discovered. The "General Slocum" was going up the East River to the Sound. He asserts that when the fire was found, the boat had passed and was 2,000 feet beyond the Sunken Meadows, off Randall's Island, where she could have been beached in shallow water. There is good testimony that when the alarm was given the boat had not reached the Sunken Meadows, but was two or three miles south of them, abreast of Blackwell's Island. Even as far south as Fifty-sixth Street a deck hand cried "fire;" flames were seen by

passengers before the boat had passed Blackwell's Island; at Eighty-fourth Street and at Ninety-second Street men jumped overboard to save themselves. How to explain the Captain's strange course we do not know. He drove ahead past Randall's and Ward's Islands, past the Sunken Meadows, past several places where the "Slocum" might have been brought to shore, until he beached and wrecked her beyond North Brother Island. Not many of her passengers were then living to take advantage of any chance to escape.

What is the lesson that the destruction of the "Slocum" and her passengers should teach? Such a disaster might have taken place on any one of hundreds of excursion boats at points along the coast. In the construction of such boats there has been very little improvement, to insure the safety of passengers in case of fire, for many years past. This is not true of ocean steamships or ships of the navy. There should be reform in construction, even if such reform would increase the cost, as experts say, by 30 per cent. Hulls should be of iron or steel; upper works should be fire-proofed, so far as this is practicable. Crews should be drilled in the work of fighting fire; all parts of the boat where fire may start should be under the eyes of watchmen. Fire pumps, hose, life preservers, life boats and other safeguards should be subject to the frequent inspection of honest officers. These reforms can be introduced in part by State and municipal legislation. Neither the people of New York nor those of any other of our large ports should be content to rely upon Federal statutes and officers for the safeguarding of local excursion traffic.

In this instance we see ample proof of the inadequacy and even the dishonesty of Federal inspection. Under local laws and officers it might be possible to prevent a boat from providing ancient and rotten life preservers, flimsy hose and chained life-rafts for the protection of a party of 1,500 women and children. Federal inspection in harbor waters would have been more searching and more honest this season if the bill which Secretary Cortelyou asked Congress to pass had been enacted. It was a bill so to enlarge his powers that more frequent and adequate inspection could be required by him, with respect to certain classes of traffic. The Senate passed it in April last, but in the House it was laid aside, owing to the influence of corporations that own ships.

Even such inspection as is now required is made ineffective by political influence, corrupt or otherwise. Such is the testimony of General Uhler, Chief of the Inspection Service. The laws are repeatedly violated, he says, because an almost entire remission of the fines imposed for violation of them is procured by the influence of politicians. We find in several newspapers this report of a statement made by him last week:

"The laws no longer act as a deterrent. We discover a boat with rotten life preservers, bad boilers and a dozen other things, a boat that somebody is operating in defiance of the law. This is punished by a heavy fine. Now what happens? The violator of the law appeals to a Senator or Congressman and to others high in political authority. The fine is reduced. I know of scores of cases where fines have been reduced from $1,000 to $20, and others from $500 to $10. The records will show where fines of $1,500 have been reduced to $25. Do the owners care for such fines?"

These charges will not, of course, be overlooked in the investigation to be made by Secretary Cortelyou.

Russell Sage on Vacations

When we asked Mr. Sage to contribute to our Vacation Number an article giving his views on the uselessness and injustice of vacations, it was not because we shared his opinions on the subject, nor have we, since reading the article, changed our own plans for the summer season, but we thought it desirable, in order to insure variety and balance in the magazine, to add to the ten articles on the benefits of vacation one showing its abuses. We expected some criticism of it and in the amount of this we have not been disappointed, but in its character we are. Out of some 300 clippings not over half a dozen show any appreciation of the points which Mr. Sage makes or make any attempt to meet his arguments. It seems that in this land of toleration and freedom of speech a man cannot express an unpopular opinion without bringing upon him a torrent

of personal abuse from the press, and subjecting himself and his family to the annoyance of numerous scurrilous and insulting letters; besides being made the subject of caricatures and vaudeville sketches.

The argument of a large proportion of the critics can be reduced to the following syllogism, which, tho not recognized as valid in the logics, is nevertheless very convincing:

I want a vacation;
Russell Sage does not want a vacation;
Therefore, down with Russell Sage.
Q. E. D.

We all of us have a natural antipathy to a man who does not agree with us, because it makes us distrust our own opinion, and that is painful. Still it is difficult in this case to see the connection between the major and minor premises in this syllogism, and therefore why we should object to Mr. Sage spending the summer in his office.

The work he does has to be done by somebody. If he is willing to do it so indefatigably, so much the better for the rest of us. Presumably under present conditions what he does is of value to other people, otherwise they would not pay him so much for it. While we can conceive of a radically different organization of society in which part of our financiers would be laid off on account of a reduction in the force, still all would admit that some at least of his multifarious activities are useful as things are. All he gets for it is his board and clothes, and so far as we can judge from the newspaper accounts, in neither of these is he as extravagant as many who take a vacation the whole year round.

If society has a right to concern itself with a man's private business, a right which will be undoubtedly more exercised in the future than in the past, it will be those who work too little, not those who work too much, who will receive attention first. If we felt ourselves authorized to inquire in suspected cases we should go first, not to the office where Mr. Sage is spending his eighty-fourth summer, but to some sturdy young man, idly leaning on his club while his caddie poses a gutta percha ball upon a cone of wet sand, and ask him what great service he had done to society during the past year to entitle him to thus make of himself merely a scarlet picture on the greensward.

The two points which Mr. Sage made, the joy of work and the abuse of vacations, have been treated with scant consideration by his critics, yet they are of fundamental importance. It is much more important that a man take pleasure in his vocation than in his vacation, because he spends more of his life at it. Indeed, it is not too much to say that unless a man enjoys his daily work he will not enjoy his vacation, however much he may expect to, for he has not the capacity for the enjoyment of the realities of the present. He deals only in futures.

The only happy man is he who feels that he is accomplishing something, doing something worth while; who feels himself an indispensable cog wheel in the great machine of the universe; who believes that nobody can quite take his place when he goes on a vacation. Without this faith in himself and the importance of his work a man is lost. No pay, however large, no prospective vacation, however enticing, can compensate the man who does not feel delight in the job he has completed because he realizes that he is of use in the world, that he is enlisted in the social service.

We do not all of us possess equally this power of seeing the real object and true value of our labor, sometimes on account of our dispositions, sometimes on account of our occupations. It is easier for a road-mender to see what he is good for than for a stock-jobber, therefore the former is usually more contented. There is, however, no drudgery so monotonous, hard and intrinsically uninteresting that one cannot find delight in doing it. To our mind no business could be so dull and distasteful as attending board meetings, reading market reports and calculating margins on puts and calls, and therefore the statement from Mr. Sage that a man can find delight in such an occupation is one of the most inspiring and reassuring utterances we have heard for a long time. No one now need despair of being able to love his own work.

When Mr. Sage said that so far from

recuperating, men will, while on their vacations, make inroads upon their vitality and purses that cannot be repaired in the following months, he was obviously thinking of vacations as they are, not as they might be; the real, not the ideal vacation; your last one, not your next one. It is an undeniable fact that the industrial evolution of mankind has far outstripped the recreative. Man has learned how to work better than he has learned how to play. When we see what harm men do to themselves and others during the short periods of independence and relaxation which they now have, we shudder at the prospect the socialists offer us of a four-hour working day for everybody. More crimes are committed for pleasure than for all other causes combined. Man is cruel in his business, but still more cruel in his pastimes. Every police court has more than double duty after a holiday, even a religious one. The devil does most of his business out of office hours. Almost any one of us would feel relieved if he could tear from the pages of the Recording Angel those pages which bear the dates of days of idleness. Churches and moralists of all ages have planted their red lights thickest over our amusements. The dangers of vacation to our quadruple personality are real and pressing, and the injury which it does to us, morally, mentally, physically and financially, should be carefully and conscientiously considered.

Leap Year Half Gone

And nothing done yet. We do not wish to urge any one to rash and precipitate action, but it is our duty to call the attention of young ladies, and, indeed, of all unmarried ladies, to the exceptional privileges which immemorial custom allows them in the quarternary period through which we are so rapidly passing. The number of June weddings shows no increase over ordinary years, and it is to be feared that the feminine world has not realized how time flies, and how little potential energy there is in water which has passed the mill. The decay of the peculiar customs of Leap Year is strongly evidenced by the almost complete lack of jokes on the subject in the newspapers, since it is well known that topical humor lingers long after the vanishing of its cause.

This is all the more remarkable since, owing to an eccentricity of the earth's orbit, which we have not here time to explain, it has been eight years since the last Leap Year. A Rachel may have worked seven years for her Jacob and not until this year had an opportunity of telling him so. It would seem that during this long period many women must have come to realize that an attitude of pure passivity is not the best adapted to win the prizes in the matrimonial market. A girl who was, say, 18 in 1896 might feel that she had but to choose one from the swarm of suitors who would soon be buzzing about the bud, but now, when she is 26, she should have acquired more sense. She should have come to realize that men adapted for making into good husbands are hard to find, and when found are often strangely blind to the virtues of those who are best adapted to become their life mates. If, however, she still clings to the policy of *laissez-faire* she will certainly regret it by 1908, when she will be 30, and her efforts must needs be still more strenuous, with less promise of success.

Perhaps we can put the matter most forcibly by saying that Leap Year is a sort of bargain year, during which husbands are within the reach of all. In that millennium to which we are all looking forward (tho directing our gaze in very different directions), all artificial restrictions and prejudices will vanish, and it will be merely a question of policy with a woman whether she shall be proposer or proposee. As it is now woman is only one-quarter enfranchised. In ordinary years man alone has the initiative and woman the referendum. Very chivalrously, however, woman is granted the longest of the years.

So far from Leap Year sinking into noxious desuetude, it might be expected that its peculiar privileges would be more widely used than ever before, now our young women are becoming more adventurous and also much harder to suit. The requirements for admission to matrimony imposed on the young men by the opposite sex have risen as rapidly

as the standard of scholarship in the universities, and a young man whose attainments a few years ago would have been considered sufficient to qualify him for the position of master of a household would nowadays have to be content with his degree of bachelor. Woman is no longer a sessile sex. The sea anemone is content with whatever food floats her way and can be wafted by the currents caused by the imperceptible motion of her cilia into the embraces of her graceful tentacles, but the fish that swims has a greater range of choice and represents a higher stage of evolution.

Really, it is not at all certain that women do not do most of the proposing every year. Very little is known about this mysterious tho important topic, any way. Each person's experiences are limited to a comparatively few instances and these are always regarded by both parties as exceptional in all respects. Novels are altogether unreliable and the Government has not added questions concerning the methods of matrimonial negotiations to the census queries, altho many more personal and less important vital statistics are procured. It may even be doubted whether matrimonial engagements are necessarily or even commonly preceded by formal declarations any more than are military engagements. We are inclined to the belief that our books of romance have deceived us in leading us to think that coldness and disdain, and even hatred, are changed instantly into confidence and love at the sound of a simple verbal formula.

However that may be, we do not recommend our maidens no matter how desirous they are, and should be, to obtain the best of men for husbands, to adopt the conventional form of proposal. Breaking the ice is a disagreeable process. It is better to thaw it. And let no one abstain from such maidenly maneuvers as she can advantageously use for fear lest the man should, through gallantry, accept her unwillingly. It is rare that a man is persuaded into doing anything he really does not want to do; much more rare than women think. A man's affection for the opposite sex is in the beginning general and diffuse. It is like a cloud heavily charged with electricity, but passing calmly over the level landscape until, attracted by a building, a tree, or even a lady's parasol, it discharges all its accumulated energy on the single point. A man is naturally so altruistic that he normally loves all women, and on which one of them he ultimately focuses the full force of his affection depends on circumstances—and on the woman.

Academic Ceremonialism

WHAT is the meaning of this outburst of ceremonial splendor and formality which has transformed the old-time college commencement? A simple and dignified function has become a spectacular performance, which the populace tumbles over itself to witness, as it scrambles for seats at the Grand Opera or for a footing on the curb-stone to see the bride at a Fifth Avenue wedding. Gorgeously attired scholars march in long processions to spacious stages, where their chromatic gowns and hoods are effectively displayed to an admiring throng, while baccalaureate sermons are preached and estimable young men and women are "admitted" to all the rights and privileges of their various degrees. Honorary degrees are conferred with all the pomp of flattering speech and of formal decoration.

Ceremonialism is not in general a mark of intellectual evolution; quite the contrary. The undeveloped mind, which lives in its sensations and perceptions and gets tired when it tries to think, loves spectacular exhibitions. The scientific mind, the scholarly mind, is supposed not to care for such excitements, and when a people that has hitherto been distinguished among the nations for the plain living and high thinking of its educated men—a people that has justly been as proud of its Emerson and its Henry as of its Lincoln and its Grant—suddenly gives itself over to processionals and flummery on its most strictly academic occasions, the causes of so startling a conversion should be worth seeking.

It is not a sufficient explanation to say that ceremony has always characterized the academic life of the old world. In the old world ceremony is an inherit-

ance from semi-barbaric days. Like monarchy and an established Church, the monkish cap and gown persist in English life because it is not always worth while to cast off the old shell of things even when the life within has been renewed. Heirlooms have a sentimental value, and ancient institutions make a legitimate appeal to the affections of men who would not create or recreate them out of hand. He that is to the manner born may appropriately do certain things that other men may not in good taste imitate. America has not set up an imitation monarchy or an established Church. Why should we imitate monastic ceremonies?

The true reason for the growth of academic ceremonialism in recent years lies much deeper than any mere desire to perpetuate old-world forms. The character of the American people is changing. A smaller proportion of our population than formerly lives a simple, uneventful life. The increase of wealth has provided the wherewithal to satisfy a desire for sensuous enjoyment, and it is not to be denied that material pleasures play a much larger part in our scheme of existence than they did 50 years ago. In the earlier days there was a hard-working class, agricultural, manufacturing and mercantile, and an intellectual class, chiefly professional. The hard-working class was on the whole a frugal and saving class. It did not spend large sums upon any kind of pleasurable indulgence or upon mere display. The standards of morals and of manners were set by the intellectual class.

To-day a well-to-do class that cares chiefly for pleasures of the senses is large enough to set new standards of manners, if not, indeed, of morals. To this class, not mentally advanced enough to care for intellectual attainments, yet wishing to be thought in some sense cultivated, the ceremonial and the spectacular make a powerful appeal. It is good proselyting material for the stage manager, who has usurped the functions of the dramatist; for the ritualist, who has displaced the theologian, and for the educational "administrator," with an eye to tuition fees and endowments.

So far as the academic world itself is concerned it is safe to say that ceremonialism has not been accepted because of any appeal that it makes to the tastes of the professorial body. It has been taken up as a "business proposition," because a spectacular show appeals more and more to the American public. The great university, like every other American enterprise, has drifted into self-advertising. It puts itself on parade for the same reason that the merchant displays his wares.

The effect of it all will not be wholly bad or wholly good. Ceremonialism accepted as intrinsically worth while would indeed be a sorry product of American educational effort. There is too much vigorous intellectual life in American academic circles to allow of such an outcome. Accepted as a concession to an existing state of the popular mind, academic ceremonialism is perhaps not to be taken too seriously.

Bobrikoff and the Finns

HOWEVER strongly the world may condemn the assassination of the Governor-General of Finland, both on account of the wickedness of the act and its probably injurious consequences to the cause of the oppressed people, we cannot be surprised at such an event, for Bobrikoff had come to be looked upon, despite all the sophistries of his sponsor, von Plehve, as the embodiment of a faithless and truculent despotism, whose continued existence means nothing less than the spoliation and ruin of the one tract in the Czar's huge empire where liberty was indigenous and full grown.

That studied policy of misrepresentation which Bobrikoff, in common with the ultra-Chauvinist elements at St. Petersburg, had pursued ever since his accession to office in Finland, had a striking exemplification in the published interview, which we quote in the Survey of the World, with the Russian journalist Belaieff, only two days before the shooting. The opening assertion that "the Finns thoroughly understand the state of affairs" is, of course, true in a sense Bobrikoff did not intend, but that "they manifest correct relations toward the Russian administration," meaning thereby "contented and submissive relations," is contradicted flatly by nearly every succeeding paragraph in the interview.

The ground assumption upon which Bobrikoff bases his arraignment of the

"agitators" is knowingly false, invented by the Russian bureaucracy for the express purpose of minimizing or localizing the Finnish opposition and thus throwing dust in the eyes of European and American critics disposed to sympathize with Finland—viz., that "the trouble is all with the Swedes." As a matter of fact, the pure Finns are as bitter over the fate of their country as the Svekomans (the Swedish-speaking part of the population) themselves, as is evidenced among other things by the fact that the Finns in America who recently offered their services to the Japanese in the present war are not Swedish-speaking, but of the pure Finnic stock. Undeniably there has been, and unhappily still is, party rivalry, sometimes very bitter, between Svekomans and Fennomans, both in and out of the Finnish Diet, and it has all along been Russia's systematic policy to envenom this rivalry and use it for the furtherance of her own designs upon the autonomy of the Grand Duchy.

"I sympathize with the Old Finns," declared the autocrat. Of course, he did. When the Swedish and Finnish speaking elements united in 1899 in face of the comman danger threatening the constitutional existence of Finland, it was Yrjö-Koskinen and a few others who, under Russian pressure, afterward broke away from the thus newly formed Constitutional Party to form a pro-Russian camp, there to preach the doctrine of abject submission, thinking thus to gain the half-loaf proverbially better than no bread at all; but it was a stone that they received, a reward from their new Muscovite lords that broke their leader's heart last November. But they constitute only a fraction of the Finnish element, that seven-eighths of the total population spoken of by the Governor-General. In point of fact, it is among the Young-Finnish wing, by far the more numerous, that are found most of the extremists, the impetuosity and occasional tendencies to violence of some of whom have been held in check, with infinite trouble, mainly by that conservative and orderly Swedish element, on whose shoulders the Russian Government seeks to lay the blame for the present universal dissatisfaction and unrest.

The Senate consists of Old Finns mainly, said Bobrikoff again, and boasted of having selected them, his creatures. But he discreetly refrains from telling the world how he forced the original Senators, who opposed his Russianizing policy, to resign, General Schaumann, the father of his slayer, among them; and how he first offered the post of Senator to numbers of prominent Svekomans and Fennomans, who alike contemptuously rejected the proffered honor at his hands.

Again, the "peaceable" passing-off of this year's conscriptions, to which Bobrikoff referred, was due to wholesale intimidation, taking the form of summary arrests, even of unsuspecting onlookers, and went the length of threats of long terms of imprisonment, of heavy fines, of deprivation of civil rights, of financial ruin, and even, as is well known, of actual banishment, at forty-eight hours' notice, of some of the most prominent Finnish citizens, whose influence was considered detrimental to Russian designs. If, then, the Finnish nation has been reduced to a seeming acquiescence in the program of Russification, it is solely because they lack the means of successful resistance, but even Bobrikoff recognized the need of concessions, and it is to be hoped that the Russians will not take advantage of the situation to adopt a still more violent policy.

❧

Concerning Judge Gray

There is a very perceptible drift toward Judge Parker in the Democratic delegations, it is true, and he is now far in the lead; but the two-thirds majority needed for his nomination cannot yet be counted. It may be at hand when the convention opens, or after one or two ballots; and it may not. There is much gossip about subterranean intrigues against him in large uninstructed delegations. The bitter opposition of Mr. Bryan must count for something with those who long for harmony and the possible fruits of it. While the defeat of Judge Parker and his friends in the convention cannot reasonably be predicted, the situation still permits a consideration of other candidates. If he should fail to obtain the two-thirds vote, to whom could the Democratic party turn with a more complete exhibition of common sense and restored sanity than to Judge George

Gray? It is true that he openly ranged himself with the Gold Standard seceders in 1896, but that should not be a sufficient bar against him now in a convention that will be controlled by the conservative element and in which many of that year's bolters will have seats. Unlike Judge Parker, he has an open political record. Everybody knows, or can easily ascertain, where he has stood as Senator, Peace Commissioner, member of The Hague Court, and chairman of the Anthracite Strike Commission. At the beginning of the Peace Commission's deliberations he was an anti-expansionist; at the end of them he signed the treaty and accepted all that it implied. This ought not to be counted against him. Imperialism is no longer a paramount issue of his party. Nor should it be his political misfortune that he lives in a small State. His party needs a well-equipped man, and he is one. There is much in the character and the achievements of Judge Gray that deserves the admiration of the American people. There is nothing that should excite the hostility of what is called the radical element of his party. He has no political agents or allies or promoters to divert attention from his merits by their own defects. If Judge Parker should encounter stubborn and effective opposition, the Democratic party, it seems to us, could not do better than to take up Judge Gray. And what an interesting ticket Gray and Folk would be!

Attempts to Muzzle the Press

We find a very interesting statement in a pamphlet containing the report of an address recently delivered by the Rev. Dr. Henry A. Stimson, pastor of the Manhattan Congregational Church of this city, and well known throughout the country as an eminent clergyman of his denomination. Dr. Stimson was reviewing a series of Sunday evening addresses upon questions of the day, delivered in his church by Superintendent Maxwell, President Butler, District-Attorney Jerome, Prof. John B. Clark, Mr. Robert W. De Forest and Mr. Thomas Thacher. To his remarks he gives the title "Some Plain Speech," and in the course of a defense of an independent press, he says:

> "A financial journal has recently called attention to the fact that one and another of our great newspapers, to enlarge its plant or increase its capital, has recently had to borrow large sums of money. For this reason, it says, the financial columns of such papers must henceforth be read with due regard to their Wall Street affiliations.
>
> "It also tells of pressure recently brought to bear in person by an eminent financier-politician upon one of our best known papers to secure the discharge from its staff of a writer on finance who had the courage to state, in a conservative paper read before an academic body, some of the salient facts in the history of the 'Ship Building Trust.'
>
> "I have personal reason to know the correctness of this report, and I also know that it is in line with other similar efforts to control our more fearless newspapers, in the interest of individuals or corporations. These attempts take the form of efforts to buy the papers, or to silence particular lines of discussion, or to withdraw profitable advertisements, or to secure the discharge of individuals from their positions. You read little of this in print. Obviously, the papers find it to their interest to say nothing. But so much must be told in order to secure a proper support for those who are loyally serving the public."

We are unable to ascertain clearly from this statement whether the pressure of the "eminent financier-politician" was exerted successfully, but we think Dr. Stimson desired it to be understood that the offending writer had to go. The public should be thankful for these revelations, even if they do not fully satisfy a righteous curiosity by giving names. Still, we should be glad if Dr. Stimson would consent to point out by name the journal in question, and also the "eminent financier-politician," because definite and complete knowledge of such transactions enables the public to punish the guilty by its disapproval and to encourage honest journals by its sympathetic appreciation and support.

Military Fumigation in Colorado

Perceiving that their course has not been universally approved, the Governor of Colorado and his interesting Adjutant-General have been sending signed explanations to the Eastern press. General Bell, who quotes passages from the Declaration of Independence as parts of the Constitution, remarks that he

regards with indifference the approval or disapproval "of adjoining States," and adds: "I am going to fumigate this district and the State before I finish. I am going to banish the agitators and then I will establish a military quarantine that will keep them banished." Fortunately, these extraordinary proceedings are in a fair way to be reviewed by the Federal Courts, either by means of the writ of habeas corpus granted by Judge Thayer in the case of the President of the miners' union, or in some other way. Those who control the Government of Colorado have made the blunder of assuming, as a dominating principle of civilized procedure, that crime or injustice on the part of individual citizens, or small groups of them, calls for and justifies crime and injustice on the part of the State. There should be no encouragement or room for such an assumption in a civilized Commonwealth. General Bell seeks to defend his despotic treatment of union men, and of all who would permit the maintenance of unions in the district where he now rules, by saying that the miners' union has been "a vehicle for the promotion of socialism." Socialism is a comprehensive term. It is not a crime to be a Socialist of any of the kinds with which we are familiar. Socialists can be found in Eastern churches and even in Eastern pulpits—possibly in the pulpits of Colorado. What the Governor and his military commander are unable to see is that their action is virtually an admission to the world that, in their opinion, Colorado cannot establish the guilt of criminals, and punish them, by ordinary civil process—that the civil power in the State is inadequate for the work, or cannot be trusted to administer justice. We think they misjudge the people and institutions of Colorado, and we shall be glad to see these vindicated by reaction that shall express popular disapproval of despotism, deportation and all kinds of military deviltry.

Government Printing

The fact that the Government Printing Office has only just now decided to use linotype and typesetting machines, so many years after they have been tried and found indispensable in every commercial office in the country, is very discouraging to those of us who look forward to an extension of Governmental management of industries. The question will come into every one's mind, What chance would there be for the introduction of any labor-saving invention if all industries were under State control? The publication of the *Congressional Record* and of bills and reports demand the quickest possible production; the enormous amount of work done authorizes the most extensive use of large machinery; being paid for by the people, it should be most economically managed; being a national establishment, its products should be creditable in appearance and execution. On the contrary, the public printing office has been a laughing stock on account of its delays, its old-fashioned methods, its extravagant and wasteful production and the poor quality of its products.

Imprison Them

One can scarcely open a paper these days without reading of the arrest of automobilists for overspeeding. It is evident that $10 fines have no more effect than the protests of countless horse owners have, or than the methods of those vulgar people in the cities' crowded districts who have lately taken up the practice of heaving bricks. Something, however, must be done. While not seriously advocating the shotgun, as did the English philanthropist last year in the *London Times,* we think that a short and sure imprisonment would do the business. Personal incarceration will have much more effect on a millionaire hog than any bagatelle fine, which he cynically sends his chauffeur to pay on the following day, and which he has now come to reckon as part of the cost of the sport.

Jim Crow Presbyteries

We call special attention to the fact that at the Presbyterian General Assembly in Buffalo four colored members spoke, and every one of them in earnest opposition to any agreement with the Cumberland Presbyterians that would set them off in separate presbyteries and synods. The only answer was that separate presbyteries

would assure them larger representation in the General Assembly—that is, it was an appeal from their honor to their vanity. It meant that if they would consent to go into presbyteries regarded as inferior, more of them might have the honor of appearing in the Assembly. But they were too clear-headed to be deceived by this argument. They had seen too much of separation in Jim Crow cars to want Jim Crow presbyteries. The argument might deceive Northern white men, but not Southern black men. Fortunately, the final decision rests with the presbyteries, and there we trust that the wiser and more Christian second thought will prevail.

The Batavia Experiment

Grading in our modern schools has proved as disastrous in one direction as it has favorable in another. The weaker and slower have been compelled to compete with the physically stronger and the intellectually more rapid workers. John Kennedy, superintendent of the schools at Batavia, N. Y., found this problem crowding for solution. Then came an inspiration. "Let us," said he to the Governing Board, "put an end to this killing of children." He proposed an extra teacher in every room, whose office would not be to hear recitations, but to give personal counsel and aid to any pupil falling behind in his class. It was to be purely a work of sympathy, requiring a person of fine tact. The experiment was tried in a single room, but the result was so marked on both pupils and teachers that what is called the Batavia Experiment is now spreading through the better class of schools in the whole United States. Altho at the time when the experiment was first made we had an article about it, the value of the experiment cannot be too often reiterated. The recitation teacher is stimulated to do less nagging, while released from goading. The pupils, on the other hand, are relieved from trying to go beyond their strength and ability. Superintendent Kennedy says "Schools may be administered to death; they may ministered into life." The president of the Board says: "This method of meeting our problem is not only a revelation; it is a revolution. It is of more than local importance." The effect on the health of the children was as marked as that on their scholarship. Children found it no longer necessary to take books home for night study—indeed, were forbidden to do so. A mother, rejoicing over a boy restored to health and intellectual vigor, declared it to be "A new phase of Christianity." As many as six times the number of pupils remain to graduate from the high school. This seems to be due in part to the fact that school life is more attractive and in part to the better health of the pupils. Perhaps there is nothing new in the idea of this experiment, but there is something new in the method. It is a realization of the Pestalozzian idea, that each pupil has a right to be personally educated for what he can best achieve. It is apparently a solution of one of the most anxious problems of modern life. We cannot afford to break down our young people in the process of preparing them for citizenship.

Satolli

In and out move the two figures in the toy which tells the weather, the man appearing in rain and the woman in sunshine. Somewhat so the Papal Delegate Martinelli disappears just as his predecessor, Cardinal Satolli, lands. We have not forgotten Satolli, nor has the American Church. He came to us first as the friend of the progressive men in the Catholic Church; but he saw a new light and suddenly reversed himself, attacked "Americanism," got it condemned at Rome, had Bishop Keane removed from the Rectorship of the Catholic University, and returned to Rome for his Cardinalate and with money to support its dignity. But of late years the influence of Archbishop Ireland has been restored, Keane is Archbishop of Dubuque, and Americanism is no longer a by-word. Satolli has officiated at a wealthy wedding, and may see a new light, but he is not a greatly loved man in the Catholic Church. If his object is to have a Nuncio received at Washington, he will be disappointed. Our Government can have no such official relations to a Church as it can have to a nation. An Apostolic Delegate to Catholics is all right, but never a Nuncio to our Government.

Insurance

Credit Insurance

THE hazards of business are so many that it is by no means strange that the subject of credit insurance has been attracting more and more attention among bankers and financiers. For ten years at least one company has been writing this class of business, and the system has now been tested very thoroughly. Credit insurance grows in popularity. It is more popular now than it ever has been before and it is more generally carried. The only insurable risks to which credit insurance is applicable are manufacturers and wholesale merchants whose business capability ranks high. All this indicates that the plan of credit insurance is practical, the conditions are reasonable and the methods generally are satisfactory. The statement that the company doing the largest business in this particular line has had but one lawsuit during the last five years is entirely satisfactory and it has yet to be denied. The methods of settlement must have been fair and the terms of the contract clear and definite or the results must inevitably have been otherwise.

Goods are generally insured against fire while they are in the store or warehouse, frequently while in transit, and the need for some form of insurance protection from loss through insolvency or otherwise, after the goods have been delivered to customers and have merely the form of book accounts, is quite as important as is insurance in any other form. There is, in point of fact, a greater need for credit insurance than for fire insurance, since the lesson of statistics is that the total losses in the United States through insolvency exceed greatly the total losses by fire. Bankers from their loan operations ought to be particularly interested in credit insurance. They may well as an additional protection to themselves encourage borrowers to avail themselves of credit insurance. This plan is in effect merely an adaptation of the collateral system to merchandising. Such a system in general use would tend toward the upbuilding of confidence in commercial circles, which would, of course, make it interesting to bankers.

Any important commercial failure is usually followed by the financial weakening, if not destruction, of a number of other mercantile firms. It also exercises a depressing influence upon business generally. Credit insurance universally prevalent would certainly prevent this. Its very plan and scope would make it impossible for the failure of one house to drag down others after the fashion of the falling of standing bricks. Panics would also be rendered impossible.

The purpose of credit insurance is to limit the annual risk of loss because of the insolvency of customers. The insurance policy or bond of indemnity provides for the assumption of an initial risk of loss to be borne by the insured. This is determined as to amount by a calculation of the average loss in the line of business of the insured, the loss record for a term of years of the insuring firm and an expert consideration of other conditions or influences which affect the hazard of the risk. The initial risk is termed the "known risk" and is a percentage of the gross annual sales of the assured. Credit insurance as at present organized provides for the refunding in cash to the beneficiary by the indemnity company of any amount of loss that is in excess of the known risk. The credit insurance policy holder is of necessity a co-insurer, so that in self interest he uses reasonable discretion, care and judgment in extending credit. There are certain restrictions, based on capital and credit ratings, as to extending credit to customers which amount in actual practice to a kind of supplement to the systems of the mercantile agencies. That is to say, the mercantile agency furnishes certain information as to a customer's financial standing, and credit insurance indicates how great a line of credit may be extended on his rating, and pays losses that may arise because of following its guidance. Credit insurance is adaptable to any business. Policies are written for one year.

ACCORDING to official reports the net losses sustained by the companies because of the Toronto fire aggregate $8,550,000.

Financial

Our Trade with Canada

Owing to the tariff changes proposed in Canada a few weeks ago, and adopted on the 16th inst., our Government's reports concerning trade with the Dominion deserve consideration. Those changes, which we discussed last week, include some slight increases of duties, designed to assist domestic manufacturers who have been affected injuriously by the British preference of 33 1-3 per cent., and also a provision for a special tax upon goods "dumped" upon the Canadian market by foreign producers at prices much lower than those for which similar goods are sold in the country where they are produced. In addition, it is intended that there shall be, after an investigation, maximum and minimum tariff schedules, which can be used for retaliation or to promote reciprocity.

It is interesting to observe that the growth of our exports to Canada has been more rapid since the adoption of the British preference, in 1897, than it was in the preceding years. In the year ending with the present month this export trade has been greater than ever before. The record of ten months shows a total of $104,000,000, against only $98,000,000 in the corresponding months of 1903, and $89,000,000 in those of 1902. It is expected in Washington that the total for the year will be about $130,000,000, against last year's $123,000,000. Canada's policy of a preferential reduction of her tariff in favor of imports from Great Britain began to be enforced in April, 1897. At first the preference was 12½ per cent.; in 1898 it was increased to 25 per cent., and it has been 33 1-3 per cent. since 1900. The following table shows our exports to Canada and our imports from that country in recent fiscal years:

	Exports to Canada.	Imports from Canada.
1885	$38,245,634	$36,695,685
1890	40,282,108	39,042,977
1895	52,854,769	36,574,327
1897	64,928,821	40,309,371
1898	83,714,086	31,870,486
1899	87,974,961	31,220,967
1900	95,319,970	39,369,074
1901	105,789,214	42,482,163
1902	109,642,993	48,076,124
1903	123,266,788	54,781,418
1904 (ten months)	104,164,521	41,312,214

While our sales to Canada have so greatly increased, those of Canada to us have remained almost stationary, and for the present year will not largely exceed the $43,000,000 of 1888, sixteen years ago. The effect of the British preference is seen in an increase of imports from Great Britain from $29,500,000 in 1897 to nearly $59,000,000 in 1903; but this addition of $29,500,000 was much less than the increase of imports from the United States ($58,00,000) in the same period.

Prof. Charles E. Sprague, President of the Union Dime Savings Institution, is preparing for the press a book comprising his course of lectures at the New York University School of Commerce, Accounts and Finance, on the "Accountancy of Investments." The work will comprise a full treatise on Compound Interest, Annuities and Sinking Funds, showing the method of valuing bonds at an interest basis, and how to write off premiums progressively and mathematically. There will also be chapters on the actual methods of account keeping for all kinds of permanent investment securities, mortgages, etc.

....Dividends announced:

Trust Co. of America, quarterly, 2 per cent. payable July 1st.

Franklin Trust Co., Brooklyn, quarterly, 3 per cent., payable June 30th.

Minn. & St. Louis R.R., Preferred, 2½ per cent., payable July 15th.

Am. Locomotive Co. (Tanner & Delaney Eng. Co. Bonds), principal and interest payable July 1st.

Western Union Tel. Co., quarterly, 1¼ per cent., July 15th.

United Fruit Co., quarterly, 2 per cent., payable July 15th.

Am. Teleph. & Tel. Co., $1.50 and extra 75 cents per share, payable July 15th.

Wells, Fargo & Co., 3 per cent. and extra 1 per cent., payable July 15th.

N. Y. Central & H. R. R.R., 1¼ per cent., payable July 15th.

Buffalo & Susq. R.R. Co., Common, 1¼ per cent., No 21, payable July 1st.

Buffalo & Susq. R.R. Co., 1st Mort. 4's, Coupons No. 7, payable July 1st.

Gulf & Ship Is. R.R. Co., Refunding 5's, Coupon No 5, payable July 1st.

Bowling Green Trust Co., 3 per cent., payable July 15th.

Real Estate Trust Co., 5 per cent, payable July 1st.

Vol. LVI NEW YORK, THURSDAY, JUNE 30, 1904 No. 2900

Survey of the World

Roosevelt and Fairbanks

At the Republican National Convention, in Chicago, last week, Mr. Roosevelt was nominated for President and Senator Fairbanks for Vice-President, both by acclamation. On Sunday Governor Odell and others in the New York delegation were urging the expediency of giving the second place on the ticket to Speaker Cannon. This was resented by the Speaker, who criticised the Governor in a characteristic statement. On Monday night the New York delegates decided to vote as a unit for Senator Fairbanks; other delegations took similar action, and there was no longer any doubt as to the second name on the ticket. The great event of the first day of the convention (Tuesday) was the admirable address of the temporary chairman, ex-Secretary Elihu Root. Obviously, within the limits of our space, we cannot summarize either his speech or any of the others which assisted in making the convention notable for oratory. In the course of his long review of the Republican party's work, Mr. Root said, concerning the Philippines:

"None can foretell the future; but there seems no reasonable cause to doubt that under the policy already effectively inaugurated, the institutions already implanted, and the processes already begun in the Philippine Islands, if these be not repressed and interrupted, the Philippine people will follow in the footsteps of the people of Cuba; that more slowly indeed, because they are not as advanced, yet as surely they will grow in capacity for self-government, and, receiving power as they grow in capacity, will come to bear substantially such relations to the people of the United States as do now the people of Cuba, differing in details as conditions and needs differ, but the same in principle and the same in beneficent results."

The Credentials Committee followed the National Committee in sustaining the Addicks delegates from Delaware and the Spooner or Stalwart faction in Wisconsin, but divided the vote of Louisiana between the Lily Whites and their opponents. Governor La Follette and his delegates formally declined to appear before the committee, alleging that their case had been prejudiced, as several members were also members of the National Committee. The vote concerning both Wisconsin and Delaware was unanimous. On Wednesday Mr. Cannon took his place as permanent chairman. For the first time in his life, he said, he had written a speech of 2,500 words, but he couldn't memorize it. Therefore, he would submit a few remarks. "Now, boys," said he, "we'll begin to ramble." In his address he was very successful, but the report of it did not agree with the prepared speech already given to the press. Then came the platform, and at the end of it the great audience was aroused by the reading of a dispatch saying that Secretary Hay had demanded "Perdicaris alive or Raisuli dead." On Thursday the nominations were made, Alabama's delegation, first on the roll, yielding to New York's, for which ex-Governor Black named Mr. Roosevelt in an address full of forcible epigrams. The audience cheered for 22 minutes. Following ex-Governor Black were Senator Beveridge, George A. Knight, Harry Stillwell Edwards, William O. Bradley, Joseph B. Cotton and Harry S. Cummings, a negro. Mr. Cannon called the roll for a Vice-Presidential nomination with confidence that he himself was safe.

Senator Fairbanks was nominated by Senator Dolliver, and the nomination was seconded by Senator Depew, Senator Foraker, Governor Pennypacker and ex-Senator Carter. Mr. Hitt's name having been withdrawn, the name of the Senator from Indiana was placed on the ticket by acclamation. Formal announcement of the convention's action will be made to Mr. Roosevelt at Oyster Bay, on July 27th, by a committee. It has been pointed out that he is the first Vice-President succeeding to the office of President by reason of death in the higher office, who has been nominated to succeed himself; also that he is the first Republican nominee for President from the State of New York. One of the delegates in this convention was a woman, Mrs. J. B. West, of Idaho. Four women were alternates, and one of them—Mrs. Charles A. Eldredge, of Colorado,—voted, in the absence of the delegate for whom she was an understudy.

The Republican Platform

Beginning with a review of the party's early history and achievements, the platform points to what has been accomplished since 1897, including the firm establishment of the gold standard, the war with Spain, the liberation of Cuba, the suppression of insurrection and the organization of civil government in the Philippines, the acquisition of the canal route, the reorganization of the army, the irrigation act and the "fearless enforcement" of the Anti-Trust law. The essential parts of the utterances concerning the tariff and reciprocity are as follows:

"The measure of protection should always at least equal the difference in the cost of production at home and abroad. We insist upon the maintenance of the principle of protection, and therefore rates of duty should be readjusted only when conditions have so changed that the public interest demands their alteration; but this work cannot safely be committed to any other hands than those of the Republican party. To intrust it to the Democratic party is to invite disaster.

"We have extended widely our foreign markets, and we believe in the adoption of all practicable methods for their further extension, including commercial reciprocity wherever reciprocal arrangements can be effected consistent with the principles of protection, and without injury to American agriculture, American labor, or any American industry."

The platform "favors legislation which will encourage and build up the American merchant marine," approves the "exclusion of Chinese labor," promises that the Civil Service law shall be "thoroughly and honestly enforced," calls for "a liberal administration of the pension laws," and "favors the peaceful settlement of international differences by arbitration." Paragraphs relating to Trusts, labor and negro suffrage are as follows:

"We favor such Congressional action as shall determine whether by special discriminations the elective franchise in any State has been unconstitutionally limited, and if such is the case, we demand that representation in Congress and in the electoral college shall be proportionally reduced as directed by the Constitution of the United States.

"Combinations of capital and of labor are the results of the economic movement of the age, but neither must be permitted to infringe upon the rights and interests of the people. Such combinations, when lawfully formed for lawful purposes, are alike entitled to the protection of the laws, but both are subject to the laws, and neither can be permitted to break them."

In a review of Mr. Roosevelt's administration, his action concerning the coal strike is called "an inestimable service to the country," his "prompt and vigorous action in Panama" is commended "in the highest terms," and his foreign policy is characterized as "not only able, vigorous and dignified, but in the highest degree successful." In the enforcement of the laws, it is said, "he has shown not only courage, but the wisdom which understands that to permit laws to be violated or disregarded opens the door to anarchy, while the just enforcement of the law is the soundest conservatism." The platform had the unanimous support of the committee, in which there was decided objection to reciprocity, except in non-competitive products, and from which the Iowa idea had been excluded by a vote of 23 to 3 in the Iowa delegation.

The Democratic Candidates

Positive instructions in Texas and Louisiana, together with favorable resolutions in one or two other States, so increased the number of votes for Judge

Parker, last week, that carefully prepared tables gave him 421 on the first ballot, to say nothing of 209 delegates not yet committed. One of his political friends will soon publish a statement, it is said, designed to show that the Judge will have two-thirds of the convention on the second ballot. The Minnesota delegation is almost evenly divided between Hearst and Parker. There are reports that James H. Eckels will lead a bolt against the Hearst instructions in the Illinois delegation and may gain the support of more than half of his associates. In the North Carolina convention there was a very large majority against a resolution asking for a division of the school fund between the races on the basis of the taxes collected. Mr. Bryan came to New York on the 20th and addressed a large audience, repeating his attacks upon Judge Parker and the New York platform. Another speaker was F. W. Hinrichs, Gold Standard Democratic candidate for Lieutenant-Governor in 1896, who opposed the candidacy of Judge Parker by alleging that the latter's judicial decisions had been in favor of corporations and predicting that he would, if elected, so readjust the Supreme Court that its decisions would nullify the Anti-Trust law. Mr. Bryan asserts in his paper that Judge Parker's candidacy was suggested and is supported by J. Pierpont Morgan.

Changes in the Cabinet

Several changes in the Cabinet are announced, to take place on July 1st, the beginning of the fiscal year. The vacancy caused by the retirement of Attorney-General (now Senator) Knox has been filled by the appointment of Mr. Moody, now Secretary of the Navy. Secretary Cortelyou having resigned, owing to his election to the office of Chairman of the Republican National Committee, his successor at the head of the Department of Commerce and Labor will be Victor H. Metcalf, now and for several years past a Representative in Congress from the Third district of California. Mr. Moody's successor at the head of the Navy Department is Paul Morton, Vice-President of the Atchison, Topeka & Santa Fé Railroad Company, and the eldest son of J. Sterling Morton, who was Secretary of Agriculture in Mr. Cleveland's second term. Mr. Moody was formerly a lawyer in general practice, and for a time was District Attorney for the Eastern District of Massachusetts. It is said that in practice he was not employed by corporations, but frequently appeared against them. He was graduated at Harvard in 1876, and is 50 years old. It has been understood that he intends to retire from the Cabinet on March 4th next. Mr. Metcalf is 50 years old, and was graduated at the Yale Law School in 1876. Mr. Morton's age is 47, and since his youth he has been in the railroad service. Originally a Democrat, he became a Gold Democrat in 1896, voted for McKinley in 1900, and recently became definitely a Republican, having been Speaker Cannon's alternate (delegate) at the Chicago convention. He has been an officer of the Colorado Fuel & Iron Company, among the directors of which are John D. Rockefeller, Jr., E. Parmalee Prentice, George Gould and E. H. Harriman. At first he declined the Cabinet office, but after a time he yielded to the urgent solicitation of Mr. Roosevelt, who was his personal friend. It is expected that Mr. Cortelyou will succeed Postmaster-General Payne after the November elections.—In his letter to the President, resigning his office, Mr. Knox expresses his "unfeigned respect and admiration for the lofty purpose and splendid courage you have ever manifested, and which has inspired and sustained your Cabinet." The President replies in a letter of the warmest commendation. "Many great and able men," he says, "have preceded you in the office, but there is none among them whose administration has left so deep a mark for good upon the country's development. You have given proof, not merely of the profound learning of the jurist, but of the bold initiative and wide grasp of the statesman. You have deeply affected for good the development of our entire political system in its relations to the industrial and economic tendencies of the time."

The Slocum Disaster

Every day has added to the number of bodies recovered from the wreck of the burned steamboat "General Slocum" and from adjacent waters. At the beginning of the present week 938 had been

found, and 80 of these could not be identified. About 100 persons known to have been on board were missing, and there were indications that the entire number of lives lost would be a little less than 1,000. An investigation made by the police pointed to a loss of 1,031, but this total included some duplications. The discharge of cannon over the waters where the steamboat was beached brought 70 bodies to the surface in one day. There were about 1,400 persons on board the boat when she started from her pier to go up the East River; only 236 escaped without injury. Testimony taken at the Coroner's inquest excites popular indignation against the owners of the boat, the crew and the official inspectors. Only 10 members of the crew (there were 23 in all) had had any experience on board ship. Nearly all of them had been picked up on the docks at cheap prices. The first mate was an iron worker and had no mate's license. Only one member of the crew was lost; it appears that he was dragged down to his death by one of the so-called life-preservers. It was proved that all the life-preservers (except 250, purchased in 1895) had been on board for thirteen years, and that as a rule they were either rotten or so constucted that they would speedily become water-soaked and heavy. Mrs. Kirchner, a passenger, was confident that she and two of her children could save themselves, because they could swim, but to another, and her youngest, child she attached one of the life-preservers. When this little girl was dropped from the deck into the water her mother was horrified to see her sink. The life-preserver pulled her under and drowned her. Scores of bodies were found with these worse than worthless life-preservers attached to them. Survivors testified that some of these appliances, when taken from the racks, crumbled in the hand like soda-crackers. Federal Inspector Lundberg, whose duty it was to see that life-preservers, fire hose and other safeguards were trustworthy, persisted in declining to testify on the ground that he might incriminate himself by answering the Coroner's questions. What was called fire hose had been bought for only 16 cents a foot; good hose would have cost nearly ten times as much. It seems clear that the inspection by Federal officers was a farce. In the compartment under the deck, where the fire started, there were barrels of highly inflammable oil. Hay and straw were scattered about, together with other combustible rubbish. Some of this appears to have been ignited by a porter, who lighted a lantern in the place to find some lamps. There was no valve for turning steam into this compartment; there had been no fire drills; one of the deckhands, who capsized a boat load of passengers by jumping upon them, and who escaped without injury, testified that he would not have known a fire alarm if he had heard one. It is expected that the owners and officers of the steamboat will be indicted by a Federal grand jury for manslaughter. An inquiry will be made by a Commission, appointed by Secretary Cortelyou, among the members of which are Major-General John M. Wilson, Commander Cameron McR. Winslow and Supervising Inspector General Uhler. Rear-Admiral Melville says that a few years ago, when he was Chief of Engineers of the Navy, he sought to procure an amendment of the defective inspection laws. A special Commission was appointed. "The recommendations of this Commission," says the Admiral in a published interview, "were so radical as to the reforms necessary to secure the safety of steamships that the mercantile marine interests rose up and killed the bill."

Panama Tariff and Currency

By executive order the Dingley tariff has been applied to the ports of the canal zone, "until otherwise provided by competent authority." That is to say, the zone has been declared open to the commerce of all friendly nations, but imports from all countries, the United States excepted, must pay the same duties that are levied upon imports at New York or any other port of the States. Imports from the States will be admitted free of duty; imports from our insular possessions at rates imposed at our ports. Goods crossing the isthmus, in the zone, by rail or otherwise, must go in bond. There are to be two collection districts, and the collectors (salary, $2,500) will be appointed by Governor Davis, who is authorized to make a reciprocal tariff agreement with Panama. There are to

be post offices at Crystobal, Ancon, Gatun, Bohio, Gorgona, Bas Obispo, Empire, Culebra and La Boca. The nine postmasters have already been appointed by Governor Davis. Goods imported from the zone into the States will probably be dutiable. An agreement as to Panama's currency has been reached. Our gold dollar is to be the standard of value. Panama is to coin silver to the value of $1,500,000 in gold by recoining the silver in local use, and the parity of this is to be maintained by a gold deposit of 15 per cent. of its nominal value in some one of our banks, together with the net seigniorage arising from the recoinage. It is expected that this agreement will be confirmed by the Panama Legislature or Convention.—This Convention has decided to encourage various industries and to establish a school of music. The commander of Panama's army has been authorized to visit and inspect the armies of the United States, France and Germany, $50,000 having been appropriated for his expenses. Some expect a revolution in Colombia following the approaching election of a President. The electoral college is said to be evenly divided for two candidates, General Reyes and Dr. Joaquin Velez. Several prominent supporters of Velez have recently been arrested.

The Haitian Incident

M. Deprez, the French Minister at Port-au-Prince, Haiti, while driving past the palace with the German Minister on June 22d was attacked and stoned by soldiers forming the palace guard. The Ministers' wives, who were in a carriage following, were also subject to attack. M. Deprez was slightly injured by a stone which struck him on the leg. The affair was the outcome of a general feeling among the population, as well as the Government, of the "Black Republic" against foreigners, the natives, it seems, being desirous of holding them responsible for the lamentable financial situation in Haiti. Proceedings against the French and German officials of the National Bank, who were charged with participation in issuing $200,000 in unwarranted securities, begun early in 1903, have not yet been concluded. Some of the banks' officers are still detained in an unsanitary prison, notwithstanding the protests of their Governments. French and German war ships have been reported as assembling in the vicinity of Port-au-Prince in case a show of force should be required. This statement, however, lacks confirmation, and as M. Deprez has since received a letter from the Haitian Government apologizing for the action of the palace guards in stoning the carriages in which he, the German Minister and the ladies of their party were driving, the incident will probably attract no further attention.

The Boundary of British Guiana

The controversy between Great Britain and Brazil on the boundary lines of British Guiana, which was referred to the King of Italy, has been decided by him in favor of the British claims, on the whole, altho it is a compromise between the extreme claims. The line fixed is nearly the same as that proposed by Lord Salisbury in 1891 and rejected by Brazil, and is described as follows:

"The frontier between British Guiana and Brazil remains fixed by the line which starts from Mount Yakontipu, continues in an easterly direction along the watershed to the source of the Ireng (Mahu), proceeds down the course of that river to its confluence with the Tacutu, follows the course of the Tacutu to its source, where it joins the line of frontier established by the declaration annexed to the treaty of arbitration concluded in London by the high contracting Powers concerned on November 6th, 1901. In virtue of that declaration, all that part of the zone in dispute lying to the east of the line of frontier will belong to Great Britain, and all that part which is to the west will belong to Brazil. The frontier along the rivers Ireng (Mahu) and Tacutu remains fixed by the *Thalweg*, and the said rivers will be open to free navigation of the two states bordering on it."

In the award the King states that neither Great Britain as the successor to the Dutch Government, nor Brazil as heir to the Portuguese territory, had an indisputable claim based upon possession, but that each had acquired by colonization, commerce and acts of sovereignty rights over some portions only of the area in question, and that the boundary should be so drawn as to follow natural lines and make an equitable division. The following general principles were laid down by the Court in the decision:

"1. That the discovery of new ways of traffic in regions which do not belong to any state cannot constitute by itself a claim of sufficient validity to give sovereignty over such regions to the state whose subjects made the discovery;

"2. That, in order to acquire sovereignty over a region not in the domain of any state, it is indispensable to effect occupation in the name of the state which proposes to acquire dominion;

"3. That occupation cannot be regarded as accomplished unless it be consequent upon an effective, uninterrupted and permanent taking of possession in the name of the state, and that the simple affirmation of the rights of sovereignty or intention manifested of proposing to render occupation effective cannot suffice;

"4. That the taking of effective possession of a part of a region, altho it can be regarded as efficacious to acquire sovereignty over the whole region when the latter constitutes a single organism, cannot be regarded as efficacious for the acquisition of sovereignty over a whole region when, on account of its extent or physical configuration, it cannot be regarded as a *de facto* organic unity;

"5. That as the result of the consideration given to the matter it cannot be admitted as established that Portugal first and then Brazil had carried out an effective taking of possession of the whole of the territory in dispute, but it can only be recognized that these states took possession of some places of the said territory and that they exercised their sovereign rights there."

The Belgian Election

Since the downfall of the last Liberal Government in 1884 the Liberal party in Belgium has been eclipsed; and, in fact, almost disorganized. The extension of popular suffrage under the peculiar system of plural voting, which it was expected would strengthen the Liberals, had just the opposite effect. The Catholics obtained control of the Government, and have kept it for twenty years, while at the same time the more radical members of the party were attracted by the Socialists. Two years ago the Catholic majority rose from 20 to 26 votes in the Chamber of Representatives of 166 members. By the last election this majority has reverted to 20, and the Liberals have gained in all nine seats, part from the Catholics and part from the Socialists. The total number of councillors in the nine provinces of Belgium has been increased from 655 to 668, the Roman Catholics having lost 26 seats, while the Liberals and Socialists have gained 36 and three respectively.

The Diamond Workers' Strike in Belgium

The strike of the diamond workers of Antwerp, which has lasted four months, has been closed by the acceptance with a vote of 2,169 to 271 by the union of the plan of the Socialist deputy, Terwagne. The propositions adopted are as follows: (1) The admission of 300 apprentices, including those already at work; (2) nomination of a mixed commission to determine the number of apprentices to be admitted in 1906; (3) the day to be 9½ hours until the end of the year and 9 hours afterward; (4) amnesty for all acts during the strike; (5) the diamond workers' association is not to sustain morally or materially any strike which may be declared by a union because of the admission of non-union men to the shops where they work; (6) a 10 per cent. increase of wages. These conditions will undoubtedly be accepted by the employers. The diamond workers in Amsterdam have made the same propositions to their employers, with the exception that the number of apprentices allowed is 500. The men at Antwerp will pay 15 per cent. of their wages to the strikers at Amsterdam so long as the strike shall last.

Turkey

The American Minister at Constantinople, Mr. Leishman, is about to enter earnestly into negotiations with the Porte to insure for American citizens, both born and naturalized, the same rights in Turkey as are granted the citizens of European nations. The European squadron under Rear-Admiral Jewell may visit Turkish waters soon to add force to his demands.—The Italian General Degiorgis, in command of the international police force in Macedonia, is reported to be doing his work carefully and justly, altho the task of bringing this long disturbed section under the sway of law and order is apparently a hopeless one. Hilmi Pasha, the Inspector General, is also working very hard to restore normal conditions, but his power is very limited

by interference from Constantinople. Neither the troops nor the civil employees have been paid for three or four months, and a revolt or strike is liable to break out at any time. The peasants, who are now enabled to return to their fields, are too late for planting and are likely to starve during the winter. The towns are still overcrowded with refugees driven out of their homes by the burning of the villages. In Monastir alone there are 5,000 men who cannot find work. Out of 323 prisoners taken from Monastir last autumn, 203 are now returned home; the others have perished from ill treatment. The refugees who have returned from Bulgaria find their houses burned and property destroyed, and they are not able to take care of themselves. The Austro-Russian program, to which Turkey has been forced to agree, provides that the peasants returned to their land shall be furnished with houses, food and implements of industry through the authority of a special commissioner, but nothing has been done to alleviate their condition. Many of the refugees, deterred by these circumstances and fearing the cruelty of the Turk, refuse to leave Bulgaria, where they are supported in part by Governmental charity. The Bulgarian and the Servian Governments have both ordered the suppression in their territories of the Macedonian Revolutionary Committees, and apparently the reform measures are to have a fair trial. The associations for the relief of the Macedonian poor are allowed to continue their work so long as it is purely non-political. If the report that the Porte has ordered that the foreign officers of the reorganized police service must restrict their action to the instruction and direction of the native police and not have anything to do directly with the people is true, then the whole scheme becomes a farce, since the primary object of the appointment of foreign officers was to get directly at the feelings and needs of the people, instead of working through the inefficient and corrupt Turkish officers.—The Sultan has signed an irade ordering complete restitution and redress to the persecuted Armenians. This is done at the demand of the Powers. An international convention in behalf of Armenia is to assemble in London, June 29th. According to the latest and most reliable reports more than 3,000 Armenians, men, women and children, were massacred in the Sasun district between April 25th and May 29th, and 50 Armenian villages were destroyed. There are 4,000 destitute refugees now at Mush, who were protected from massacre by the intervention of the French Consul.

At Port Arthur

The Russian fleet moved out of the harbor on the 23d and stopped at the entrance, waiting for night to come before starting for the open sea. Admiral Togo was speedily informed by wireless telegraphy from his patrol boats, and he advanced with all the vessels at his command. The Russian fleet was composed of six battle ships, five cruisers and fourteen destroyers. As soon as it was dark the Japanese torpedo boats attacked the fleet, which was sailing south, and drove it back to the harbor entrance, where the "Peresviet" was hit by two torpedoes and sunk. The "Sevastopol" was seriously disabled. The cruiser "Diana" also seems to have been injured, as she was towed into the harbor on the following morning. The Japanese torpedo boat destroyer "Shirakumo" was hit by a shell, which killed three men and wounded three. There was no other loss of life on the Japanese side. The Russian fleet did not get more than eight miles from the port, toward which it retired in confusion when the Japanese approached. The mines planted by the Japanese in the harbor entrance were cleared away by steamers preceding the fleet. Hector Fuller, the correspondent of the Indianapolis *News*, who entered Port Arthur in an open boat rowed by two Chinamen, and was put in prison for five days before being released and sent to Che-Foo on board a Chinese junk, says that the Japanese blockade is ineffective, and that supplies are being received all the time from Chinese ports. The garrison consists of 50,000 to 60,000 troops, and they are in good health and spirits. This is quite contradictory to the reports which have been continually received from the Chinese, that the garrison of the besieged city were already on the verge of starvation. There has been no important fighting on the land side at Port Ar-

thur. It is reported that a fourth Japanese army under General Nogi will land near Port Arthur and conduct the siege, leaving General Oku free to follow the Russians northward. Probably the two transports which were intercepted by the Vladivostok squadron were conveying part of this army.

The Japanese Advance

The main armies are now being brought up in line of battle, and it is probable that the most decisive land engagement of the war will be fought very soon before the rainy season begins, when field operations on a large scale will be impossible. Since their defeat at Wafang-Kao the Russians have made no further effort to check the northward march of General Oku's army up the Liao-Tung peninsula, and he has now effected a junction with General Kuroki's left wing at Siu-Yen. The Japanese front, therefore, extends in one long semicircle of 150 miles, extending from Samaja on the northeast through Feng-Wang-Cheng and Siu-Yen to Kai-Ping on the Gulf of Liao-Tung, to the southwest. The concave side is then toward the railroad along which, below Mukden, the Russian forces are concentrated. If, as is reported as we go to press, the Russians are withdrawing from Kai-Ping without a contest, it is for the purpose of securing a better position to make a stand; probably at Tashi-Chiao, where the railroad branches off for Niuchwang, or Hai-Chen, still further north at the crossing of the Pekin road.—The official report of General Oku gives the Japanese losses at the battle of Wafang-Kao (or Telissu) as 247 killed, including seven officers, and 946 wounded, including 43 officers.—The Vladivostok squadron on its return with booty and prisoners received a great popular welcome. The American commercial agent at Vladivostok, Richard T. Greener, is looking after the interests of the Japanese prisoners and sending messages to their relatives. Mr. Greener reports that no inhabitants are permitted to remain at Vladivostok unless they deposit 432 pounds of flour, 72 pounds of buckwheat and 27 pounds of salt as a guarantee of ability to stand a siege. The three English officers of the transport "Sado" captured by the squadron in the Straits of Korea are prisoners at Vladivostok. The "Sado" lost $1,000,000 in English gold. The commander of a Russian torpedo boat in the recent raid sent his card to the Governor of Hakodats, excusing himself for not calling in person and saying that he would return soon.

Perdicaris Released

Secretary Hay put an end to the intricate diplomacy which seemed likely to delay indefinitely the freeing of the captives, by telegraphing to Consul-General Grummere at Tangier to demand from the Moorish Government "Perdicaris alive or Raisuli dead." Three days later, on June 25th, five weeks after their capture, Ion Perdicaris and Cromwell Varley arrived at Tangier. No guarantees of any kind were made by our Government and no marines were landed. The State Department will not make any demands on the Moorish Government for indemnity or punishment. The Sherifs Muley Ali and Muley Ahmed conveyed the ransom to Raisuli and escorted back the prisoners. The American fleet under Rear-Admiral Chadwick has left Tangier for Gibraltar and will cruise down the east coast of Africa to Cape Town. Mr. Perdicaris, who, on account of his age, has suffered in health from the hardships of his journeys, will soon leave for Europe. The ransom of $70,000 demanded by Raisuli was paid from the new French loan of $12,500,000, and France takes the credit for securing the release, which will give an opportunity for France to strengthen and increase her control over Morocco, as she is permitted to do by the recent Anglo-French treaty. The French Foreign Minister, M. Delcassé, has selected M. Raindre, the representative of France at Geneva, to take charge of the custom houses of the Morocco ports. The French loan is secured by the custom receipts, and his position and power will be similar to that of Sir Robert Hart, who for many years has managed the Chinese customs. A French police force will also be organized in Tangier. Raisuli gets the governorship of four large tribes covering some 500 square miles of territory between Tangier and Larache and Alcazar.

Unpublished Letters*

BY HERBERT SPENCER

Part III.—The Henry George Controversy (Concluded)

[With this instalment we conclude the publication of Spencer's letters to American friends. All of these here included relate to the Henry George controversy. With the exception of Letters XXXII and XXXIX, they are all addressed to Mr. Skilton. A reply to the personal attack of Mr. George was eventually prepared by a committee, including John Fiske and Daniel Greenleaf Thompson, and published in the New York *Tribune,* November 12th, 1894. A rejoinder by Mr. George was subsequently published in the *Tribune* and reprinted by the Manhattan Single Tax Club. With the publication, in the spring of 1895, by Spencer's American friends, through the house of D. Appleton & Co., of a pamphlet on the philosopher's views on the land question, Spencer, according to his own words, "washed his hands entirely of the whole George business."—EDITOR.]

XXXII.

TO DR. JANES.

October 22, 1894.

DEAR DR. JANES: Since receiving your letter I have been so much worried about various matters and so ill (partly in consequence) that I have continually postponed replying.

It is pleasant to have so sympathetic a letter, and pleasant also to hear your report of progress and the cordial manner in which your addresses were received. I hope future reports will be equally good.

I have been in bed these four days, and I do not know that I should even now write to you, were it not that this George business forces me. You will probably have heard by this time that I have sent the draft of a letter to Mr. Skilton which, with modifications or omissions if you think them desirable, may serve as a sufficient reply to this unscrupulous assailant.

Letters from Mr. Skilton apparently imply that he was thinking of acting alone in the matter. This I very decidedly object to. The letter, whatever it may be, should emanate from more than one, and as you are probably already aware, I have expressed the wish that you and Dr. Youmans should join Mr. Skilton in such responsibility for its facts as signatures imply. There is, however, practically no responsibility, for all the facts, in a form beyond question, are before you. Mr. Skilton rather implies that Dr. Youmans is to some extent unwilling to act. . . . Should this be so, I am proposing that some other of my American adherents should take his place. I daresay Mr. Manton Marble, if he is in New York, would do so, or Fiske, if he is at hand; or, in default of these, there is probably some other well-known member of the Brooklyn Ethical Institute, as Dr. Eccles or Mr. D. Greenleaf Thompson, who might assent. In any case, I think the authenticity of the facts stated should be guaranteed by more than one name.

XXXIII.

November 25th, 1894.

DEAR MR. SKILTON: Thank you for all the trouble you have taken in the George business. There have been in the course of the arrangements sundry dangers which have now been happily avoided, and the final result is as good as I could wish. Whatever Mr. George may say, I do not think he will succeed in neutralizing this effective exposure.

Thanks for the numerous impressions of the letter which you have inclosed to me. Pray do not trouble about sending any copies of the *Tribune* in conformity with the list I sent. On the whole I have decided that such a course is undesirable. The only passage likely to be reproduced here would be the one concerning the Duke of Westminster and myself, and when taken away from its context and the reasons for narrating the incident such a publication would seem out of taste.

* Copyright, 1904, by THE INDEPENDENT.

If you feel inclined now to make a flank attack by dealing with Henry George and his doctrines, by all means do so; but if you do, please take care not to bring my name or my views into the matter. I do not wish to be in any way implicated. I know from past experience how easily one may be drawn unexpectedly into controversy, and I have had more of this than I want.

XXXIV.

December 13th, 1894.

DEAR MR. SKILTON: I have to apologize for inadvertently betraying you into an awkward position in connection with the letter to the *Tribune,* for it may seem to many that you have been a party to the garbling of a sentence, as alleged by Mr. George. In reality it is not at all so, but quite otherwise. In appearance, however, there seems a ground for such an allegation, and it was a great misjudgment on my part not to see that a ground would be given. The words omitted, referring to the County Council election of 1892, were omitted for the sake of brevity (which, of course, was important) because they had no apparent relevance to the issue, which was whether I belonged to a body formed for defending landed interests. The fact is that in so far as any such relevance is concerned, the words would have told, not in favor of Mr. George's interpretation, but against it. The body to which he now says he referred, the London Ratepayers' Defense League, was *not* active at that election and it did *not* take up the question of taxation of ground-rents; whereas the body which he says he did not mean, the Liberty and Property Defense League, *was* active and *did* take up that question. But I blame myself for overlooking the fact that the omission might be laid hold of and ascribed to a wrong motive, and that any one who signed the letter would be compromised. I have been very much vexed about the matter.

I will, as soon as it is published at the end of the month, send you a letter issued here by the late secretary of the London Ratepayers' Defense League, in which the above facts are authoritatively stated.

A few days ago I decided that by way of setting finally at rest this abominable business in America, it would be well if I published there the pamphlet referred to in the inclosed preface, which I drew up for it—a pamphlet not at all in any direct way replying to Mr. George, but indirectly disposing of his allegations. I have, however, since come to the conclusion that this course may be of doubtful policy, since, conclusively disproving all he says as the pamphlet does, it will, nevertheless, furnish him with texts for further diatribes. I send over the preface to you and to your co-signatories to ask an opinion on this point.

P. S.—Your letters with the inclosed slips from the *Tribune* have arrived while this is in hand. Many thanks for all your further trouble. The letter is, tho moderate in tone, sufficiently strong and effective, and I think could for its purpose hardly be better.

From the above you will see that I hesitate a little as to the propriety of giving Mr. George any further opportunities of carrying on the controversy, and for this same reason I hesitate respecting your proposed war with him carried on independently. If it could be done in such manner as to leave me out of the question it might be well, but to leave me out would be difficult. Any general charge against him of unscrupulousness, dishonesty and so forth, if it could be otherwise made and substantiated, might very fitly be made and would tend further to discredit him. But he is so unscrupulous that he would go on fighting and asserting, spite of the most obvious demonstrations that his statements were false, and there are very many people who accept false statements as having some truth behind them. The proceeding will be something like entering into a contest with a rattlesnake. You scarcely know where and how you may be bitten. It will, I think, at any rate be best to be guided by Dr. Youmans and Dr. Janes in the matter.

XXXV.

December 23d, 1894.

DEAR MR. SKILTON: Of course, this fellow George will work the business to his own advantage without the slightest scruple as to method and truthfulness. I am still in two minds as to the policy of issuing the pamphlet and preface of

which I sent you copies. It would enlighten people and in one way set the matter right, but it would give him texts for further writing and for obscuring the essential questions by raising side issues.

I incline now to approve of your intention to make a flank attack upon him, and the occasion now given seems a good one. The points to be taken up seem to be:

(1) That (if I understand your allusion rightly) he has in "Progress and Poverty," when referring to my views on the land question, suppressed the fact that I advocated compensation—his suppression being imitated by his friends over here. This itself at once shows his dishonesty and vitiates his whole argument.

(2) He gives the world the idea that I have swallowed my original convictions and no longer hold the views I originally held respecting the *ethics* of the land question. This, as is shown by the extracts in the preface I sent you, is absolutely untrue. In the third paragraph of that preface you will see briefly indicated the parallelism between my original views and my present views on all the essential points. The passages there given from "Social Statics" and "Justice" you might quote independently in proof that I have not swerved from my original view, and that contrariwise in "Justice" I have emphasized that view by various lines of evidence. This clearly put will be a revelation to his adherents, since it will show that he has given them a total misconception.

(3) It may then be pointed out that while adhering to my original view on the ethics of the matter, I have simply diverged from that view in respect of the *policy* of the matter. Holding still, as I did originally, that compensation must be given, I now hold that adequate compensation would entail on the community so heavy a debt that the transaction would be a losing one, and that hence it would be unwise to change the present arrangement, especially as public administration would not be nearly so good as private administration. The fact to be emphasized is that all Mr. George's vituperation is vented upon me because, whereas I once held that there would be a balance of advantage to the public if the land were resumed with compensation, I now think there would be a balance of loss. Marvelous to relate, this is the sum and substance of my offense in his eyes, because I presume he would not make any compensation at all and has led the public to suppose that *I* did not advocate compensation.

(4) Then his assertion that I changed my opinion for the purpose of ingratiating myself with the landed interest is disposed of by the fact that the view I took is the view that has been expressed by leading land-owners.*

I should be glad were these several points clearly put; but where do you propose to publish any such flank attack?

XXXVI.

December 24th, 1894.

DEAR MR. SKILTON: I am again in two minds as to the best course to pursue. It does not matter how conclusive the case may be made against Mr. George, he will still go on arguing and asserting and multiplying side issues about irrelevant matters. The politic course, therefore, is to make one good point and there leave it.

If I am right in the inference that in "Progress and Poverty" he said nothing about my insisting on compensation, that should be the point made, and it should be asked: How is it possible to discuss with a man who deliberately falsifies to that extent—who himself says that the thing should be taken and not paid for and represents another, who says it should be paid for, as holding the same view with himself? After making it clear that he is guilty of this falsification, it may be asked how the other statements he has made can be trusted; pointing out that a man who thus falsifies in one case will falsify in other cases, and that it is useless to argue, since the more difficulties he is placed in the more falsifications he will be guilty of.

XXXVII.

December 29th, 1894.

DEAR MR. SKILTON: It has occurred to me since writing to you that your flank attack might be usefully extended so as to bring into question Mr. Henry

* The quotation showing this which I have used in the preface you will find given in "Justice," with the reference.

George's motives for his agitation. There are plenty of facts showing that he has been pushing it for his own personal advantage. Clearly this last move of his, in issuing a pamphlet, is with a view to regain his notoriety, to sell his books and to get money. Probably the raising of such question would form an effective diversion.

XXXVIII.

January 12th, 1895.

DEAR MR. SKILTON: Lies and treacheries are implements of war, regarded as quite legitimate in actual war. I saw a while ago in some speech of a trades unionist that they regarded their relations with the masters as a state of war, and that their acts, ordinarily regarded as criminal, were legitimate. Doubtless Mr. George and the land nationalizers think the same thing and are prepared to abandon all moral restraints in pursuit of their ends. Hence this proceeding of his, congruous with all his other proceedings. Hence, too, similar proceedings over here. Tho I interdicted the republication of the correspondence in the *Daily Chronicle* along with that pamphlet you have, yet they have now issued it separately without asking me. They have done this not only in defiance of justice, since, as I pointed out, I did not wish the republication of statements to which I could not assent (and which I could not go out of my way to rebut), but they have gone also contrary to law, for these published letters cannot, I believe, be reprinted without my assent; and they have certainly gone contrary to law in printing other letters not before published. They do so, I suspect, thinking that I dare not get an injunction because then they would be able to charge me with fearing the results of the republished correspondence. So it goes on. When you have to deal with dishonest people there is no evil that may not come upon you. I begin to feel that the more one multiplies points of contact with one's kind the worse for one.

This fact which you have ascertained with regard to the date of publication of Mr. George's pamphlet is very satisfactory, and I should hope there will occur an occasion for using the weapon, if you are thoroughly satisfied as to the testimony. What is the American law with regard to the republication of such documents as the letters in *The Tribune?* Is it legitimate for any one who pleases to republish the joint letter of yourself and friends without asking leave? I do not think that can be done here, and I should think it cannot be done with you. The dishonesty of the man is further shown by his title, "Herbert Spencer *versus* Henry George," which, of course, will lead people to suppose that I have publicly entered the lists with him.

As to your proposals for a brief treatise on the land question at large from me in further explanation, I do not see my way. If I were to say anything more in addition to what is contained in the pamphlet, the publication of which you think is desirable, it would be merely in further explanation of the attitude I have taken and would mainly consist of further reasons why I think the change from the system of private ownership would be a disadvantage. Perhaps it might be well to say as much as this, but as to anything larger, such as you adumbrate—a general conception of the relations of men to the soil based on general sociological principles—I have got nothing to say. If, as it would seem, you think that I have got a scheme for future society in my head, you are altogether mistaken.

XXXIX.

[The following letter refers to a lecture delivered by William Lloyd Garrison, Jr., in Chickering Hall, New York City, January 6th, 1895, attacking Spencer.—EDITOR.]

TO DR. E. L. YOUMANS.

January 22d, 1895.

DEAR DR. YOUMANS: The inclosed report of Garrison's lecture which Mr. Skilton has sent me opens my eyes to the fact that it is needful that the public should be disabused of the notion that I have changed my essential convictions. The whole of George's vituperation and the whole of this lecture proceed on the assumption that I have repudiated my views on the ownership of land, which I have not, having only changed my view with regard to the financial policy of a change. If this fact is made clear it takes the wind out of George's sails.

Inclosed I send the draft of a letter in which this is demonstrated, and unless you see strong reason to the contrary, I

should be glad if some one—either yourself, or Dr. Janes, or Mr. Skilton—would publish this letter in *The Tribune* or elsewhere, if possible in several places. One place might be the *Advertiser,* in which this report of Garrison's lecture is given. There should also be a copy sent to the Chicago papers.

After the publication of such a letter I do not think there can remain anything more to be said.

XL.

[The following is the draft of the letter Spencer inclosed.—EDITOR.]

January 22d, 1895.

DEAR MR. SKILTON: This indorsement of Henry George by Garrison and this repetition of his statement that I have swallowed my convictions at once awakens me to the fact that nothing has been said by way of proof that I have done anything of the kind.

It seems to me now that the only thing required to dispose of the whole matter is that this should be made clear to people and strongly emphasized. I have by this post sent to Dr. Youmans the draft of a letter clearly pointing out that the sole change in my doctrine is respecting the financial prudence of making a change from private tenure of land to public tenure. I am desirous that this letter should be published as widely as possible. If publication of it can be obtained in more than one journal I should be glad; certainly there should be a publication in Chicago as well as in New York, and if through several media in each place so much the better. One copy should, I think, go to the *Advertiser,* which publishes the report of Garrison's lecture.

It further occurs to me that *after* the publication of this letter you might open your proposed battery upon Henry George, having then clear ground for your attack. I presume your attack would be based upon the fact that the evidence clearly set forth in the letter I have named above is evidence which he had before him in the two chapters quoted by him in the "Perplexed Philosopher." You would, I suppose, emphasize the astonishing fact that he hurls at me all kinds of elaborate calumnies on the assumption that I have changed my essential convictions, in face of the fact that in the very book itself he has in the chapters he quotes given proof that I have *not* changed them; and that thus he appears to have counted upon the blindness and credulity of readers (and rightly so counted) in supposing that they would take his blustering assertions in face of the facts before their eyes.

Of course, in any such letter, if you wrote it, you would give the substance of the above paragraph not in the first person but in the third person. And you might go on similarly in the third person somewhat as follows:

> But why has Mr. George been guilty of these gross and perverse misrepresentations? Obviously from desire to be revenged on Mr. Spencer because he characterized Mr. George's views as "visionary"—a word which he did not apply to the general views about land ownership, but to Mr. George's view, expressed early in his book on "Progress and Poverty," that change of land tenure would cure all social evils.

Of course, such a letter, if you wrote it, would be written quite independently by you as being based upon my published views—a letter such as, in fact, might be written by anybody, even a stranger.

Having thus demonstrated the baselessness of Mr. George's allegations and the absence of any warrant for his vituperations, you might then go on to make the flank attack which I named—namely, inquiring what are his motives for carrying on the agitation, charging him to disprove the assertion that he is doing it for personal benefit.

You will, I presume, on receipt of this see Dr. Youmans and have a consultation with him respecting both the letter I have sent and that above sketched.

P. S.—You might sum up the whole business by stating the case thus:

(1) Mr. George charges Mr. Spencer with having abandoned his expressed convictions for the purpose of ingratiating himself with the landed class. This charge has been met by the facts that Mr. Spencer has in various cases asserted his beliefs in utter disregard of personal interests—as in condemning national education in the teeth of current opinion alike in England and America; as by blaming the Americans for their misrepresentation of English opinion at the outbreak of the war; as by ridiculing two large land-owners at the time they were Prime Ministers—and he has shown an

utter absence of that desire ascribed to him by refusing to have his name publicly associated with that of a duke. Mr. George has not only failed to rebut these statements of fact, but he has made no attempt to rebut them, and nevertheless he continues his vituperations as before.

(2) And then, marvelous to relate, while it is charged against Mr. Spencer that he has changed his professed opinion with regard to the ethics of land ownership from corrupt motives, we have demonstrative proof that he has not changed his opinion at all, but still continues to assert supreme ownership by the community, and has even enforced that assertion by further evidence. He has altered his opinion not in the least in respect of the *equity* of a change from private ownership to public ownership, but only in respect of its *prudence.* The transaction which he once thought would be financially beneficial he now thinks would be financially injurious and should therefore not be made.

(3) And, then, still more marvelous to relate, the doctrine which Mr. Spencer is wrongly said to have abandoned for the sake of ingratiating himself with the landed classes in England is a doctrine which these landed classes themselves hold. The very motive which is said to have caused him to make a change of opinion which he has not made is a motive which actually cannot possibly exist, since his original opinion is an opinion in which the landed class coincides.

It seems scarcely possible to imagine a fabric more completely made up of fictions and contradictions than that which Mr. George has raised.

[The draft of a reply to Henry George sent by Spencer to his American friends and referred to above.—EDITOR.]

A profound misconception respecting the difference between Mr. Spencer's original doctrine concerning land ownership and his present doctrine has been widely diffused, and it seems desirable that this misconception should be dissipated by a simple statement of what his original view was and what his present view is.

(1) Mr. Spencer originally taught that the land could not become individual property but was the property of the community, and that this is, in fact, the current legal doctrine; since the State assumes the power to appropriate any land it pleases on making compensation. This he continues to teach, and in "Justice" he not only adheres to this view, but emphasizes it and strengthens it by numerous facts showing what is the tenure of land in early communities, and that that tenure is of the kind he alleged —ownership by the community.

In these passages it is shown that among the uncivilized private ownership of land is unknown; that originally among the civilized the relation of men to the soil "was one of joint ownership and not one of individual ownership;" that the cause of the change from this original state "must have been the exercise of direct or indirect force, sometimes internal but chiefly external;" that in England "no absolute ownership of land is recognized by our law-books except in the Crown;" and that the changes which have "replaced the supreme power of the monarch by the supreme power of the people have, by implication, replaced the monarch's supreme ownership of the land by the people's supreme ownership of the land." Here, then, there is not the least surrendering of the original doctrine, but rather an enforcement of it.

(2) Along with this assertion of the claim of the community to the land itself, Mr. Spencer, in "Social Statics," made the further assertion that the private owner has a claim to all that value given to the land by clearing, draining, cultivation and all the appliances standing upon it for carrying on food production. Here are two passages from the chapter on "The Right to the Use of the Earth," clearly showing this:

(a) "Well, but surely you would not eject me without making some recompense for the great additional value I have given to this tract, by reducing what was a wilderness into fertile fields. You would not turn me adrift and deprive me of all the benefit of those years of toil it has cost me to bring this spot into its present state."

"Of course not; just as, in the case of the house, you would have an equitable title to compensation from the proprietor for repairs and new fittings, so the community cannot justly take possession of this estate without paying for all that you have done to it. This extra worth which your labor has imparted to it is fairly yours; and altho you have, without leave, busied yourself in bettering what belongs to the community, yet no doubt the community

will duly discharge your claim. But admitting this is quite a different thing from recognizing your right to the land itself. It may be true that you are entitled to compensation for the improvements this inclosure has received at your hands; and at the same time it may be equally true that no act, form, proceeding, or ceremony can make this inclosure your private property."

(b) "But, unfortunately, most of our present land-owners are men who have, either mediately or immediately—either by their own acts or by the acts of their ancestors—given for their estates equivalents of honestly earned wealth, believing that they were investing their savings in a legitimate manner. To justly estimate and liquidate the claims of such is one of the most intricate problems society will one day have to solve. But with this perplexity and our extrication from it, abstract morality has no concern. Men having got themselves into the dilemma by disobedience to the law, must get out of it as well as they can; and with as little injury to the landed class as may be."

The view here set forth is the view still held by Mr. Spencer. Here again there is no change.

(3) What, then, is the change? Of course, when in "Social Statics" resumption of the land by the community was shown to be equitable and advocated as desirable, it was on the assumption that the transaction, after making compensation, would leave a balance of benefit to the community. It is clear that if Mr. Spencer had thought that the change, tho equitable, would entail a loss on the community he would not have held that the community ought to bring this loss upon itself; but would have held that tho, as a matter of abstract equity, it might properly retake possession of the land, it would be impolitic to do this if the burden of compensation would outweigh the benefit of possession. But of late years, on thinking over the matter, it has become clear to him that the burden of compensation *would* outweigh the benefit of possession, if the compensation were anything like equitable in amount. Hence he has come to the conclusion that the change of tenure from private to public would be impolitic. He writes: "Moreover, I did not clearly see what would be implied by the giving of compensation for all that value which the labor of ages has given to the land."

(4) It is true that in further qualification of his original view Mr. Spencer has pointed out (more especially referring to England) the untruth of the prevailing assumption that the existing land-owners are either those who made the misappropriation or the descendants of those who made it, and has further pointed out that among the people who are supposed to be robbed exist, in large measure, those who are the descendants of the robbers, and that thus the anger everywhere fostered is misdirected. And he has also pointed out (again in respect of England) that if anything like the proposed restoration were to be carried out, it would require that England should be handed over to the Celts of Wales and Scotland, as the only people who have any claim (tho a disputable claim) to be regarded as original proprietors. It is also true that he pointed out to how large an extent in England, since the reign of Elizabeth, the landless class has shared in the produce of the land under the Poor Law, and that, therefore, if we go back upon the past, this fact must be taken into account. But all these further considerations are put in the form of difficulties in the way of a change, and are not at all held to invalidate the two original propositions—(1) that the land itself belongs to the community, and (2) that it cannot be resumed by the community without compensation for the artificial value given to it. These were Mr. Spencer's original views; these are his views still.

(5) It should be added, in further explanation, that the views originally held by Mr. Spencer, as well as the modified views now held by him, are not, as is commonly supposed, at variance with the views held by the landed classes in England; but, contrariwise, are views which they have themselves publicly enunciated through certain representative members of the class.

The Council of the Liberty and Property Defense League, on which sit several peers and two judges, said in their report for 1889 that "the land can, of course, be 'resumed' on payment of full compensation, and managed by the people if they so will it." Supreme ownership by the State is fully recognized, and the only reason urged for maintaining the existing system of land-holding is the badness of the alternative system—administration by public officials. They do not, however, name the primary obstacle to the proposed change—the enormous

cost of equitable compensation, bringing to the community not gain but loss.

These are not matters of opinion, but are matters of fact which anybody can ascertain by referring to early editions of "Social Statics" and to "Justice." They are there in print, not to be gainsaid or argued away.

XLI.

January 23d, 1895.

DEAR MR. SKILTON: On further thinking about the matter, I lean to the conclusion that the letter I sketched out for you to write, as a supplementary letter, would perhaps be better left alone. It is clear that this unscrupulous fellow will not be silenced by any demonstration, and would simply get more texts for his misrepresentations; and evidently his followers are so blind and prepossessed that nothing, however conclusive, is held to disprove his allegations. I think, therefore, that it would be best to limit the further action to the publication of the leter which I sent to Dr. Youmans, which, being a simple statement of fact, does not afford any foothold for further controversy, and written in an impersonal way, as it is, will be a more dignified ending of the business than any other.

You have never told me how the whole business has been commented upon—whether other newspapers have had any remarks about it and to what purport?

XLII.

February 15th, 1895.

DEAR MR. SKILTON: I am glad that you and Dr. Youmans agree in the general course to be taken, and think you are right in modifying the special course I named in the proposed way—issuing the letter as being a preface to the forthcoming pamphlet.

Herewith I return the letter with the small addition and the emendations you suggested.

Will it not be well to at once forward copies of this letter to the papers with an explanatory note that it is the preface to a forthcoming pamphlet and let publication of the pamphlet take place afterwards?

I suggest this partly because I am not on the instant prepared to send you the postscript which I named. I cannot do this until after my return to town, where only I can obtain some of the facts needed. This will cause a delay in the issue of the pamphlet, but need not, I think, cause delay in the separate distribution of the preface as you propose.

Along with the returned and corrected letter I inclose two copies of the last leaf of the pamphlet, on each page of which there is an appended note serving to strengthen the argument.

XLIII.

February 22d, 1895.

DEAR MR. SKILTON: Herewith I inclose the postscript for the pamphlet. In pursuance of the resolution which you intimate to me as agreed upon by friends, the pamphlet may now with its preface and postscript be issued without further delay.

With its issue I must wash my hands entirely of the whole of the George business. My small amount of working power has been frittered away in a terrible manner by this business, and all the thought and worry and correspondence it has entailed. I must now shut it out altogether and resist every distraction.

XLIV.

May 10th, 1895.

DEAR MR. SKILTON: Last night I received safely along with your letter the two copies of the pamphlet (and also a number from the Appletons) which has been so long delayed—I may say so inexcusably delayed. Thank you for all the great amount of trouble you have taken in the matter—distributing the preface, and now again, as you propose distributing the completed pamphlet.

Of course, as you say, judging by the attitude taken by Mr. Garrison, the Georgeites will be not in the least affected, save perhaps by being prompted to further vituperation. My estimate of human character, never very high, has become lower and lower, and the behavior of the so-called advanced political agitators, radicals, socialists, land nationalizers and the rest lowers it still further.

You have not sent me any of the papers (except one) which published the preface with comments. Have they not generally made any comments?

[THE END.]

The Spencer-George Controversy

BY T. SCANLON

[With the conclusion of the publication of the Spencer letters in regard to the Henry George controversy we have thought it would interest our readers to hear how the letters appear to those friendly to Mr. George. We accordingly print the following article from Mr. Scanlon with that end in view.—EDITOR.]

OUT of all the letters in the present collection there are only three which I intend to discuss as bearing pertinently upon the all essential issues, which I take to be these: (1) What was Spencer's position on the land question in 1850? (2) What was it in 1891? (3) Was the process a valid one, whereby the change from the earlier to the later position was effected? The letters dealing with those questions are those numbered 22, 35 and 40.

In the first one he displays what I will only assume to be a strange unfamiliarity with his own writings, for he there makes it appear that the sentences which he quotes respecting the landlord's right to compensation for the value which the labor of "successive generations" has given to the land, and the wrong that the community would be guilty of if it took more than the value of the land in its original subdued state, were to be found in "Social Statics," as well as in the more recent work, "Justice." While the language he quotes, and much more to the same effect, is to be found in "Justice," neither it nor anything approaching to it is to be found in "Social Statics." Not only is this so, but in the draft letter to Spencer's American friends, appended to letter 40, there is an admission that when writing "Social Statics" the idea never dawned upon Spencer's mind that all which could be claimed for the community was the surface of the country in its original, unsubdued state. The admission is in these words:

"Moreover, I did not clearly see what would be implied by the giving of compensation for all that value which the labor of ages has given to the land."

Spencer, however, does deal with the subject of compensation in "Social Statics." He mentions it as one of the difficulties of detail to be encountered in restoring the land to the community. In some of these letters he appears to have been under the impression that George, in "Progress and Poverty," suppressed the fact that he (Spencer) had advocated compensation. This, of course, was a delusion; George in "Progress and Poverty" gave full credit to Spencer for advocating compensation to landlords for dispossession, altho he thought Spencer inconsistent in doing so. But later on, when writing "A Perplexed Philosopher," George abandoned this interpretation and came to the conclusion that what Spencer meant must have been compensation for improvements only.

Which interpretation was correct? The answer to this question depends upon the meaning we attach to the word "improvement." When does an improvement cease to be an improvement, or does it ever cease? Without going into such refinements as these, however, and taking words in their ordinary significance, my opinion is that Spencer meant both kinds of compensation, but in a mild form, and as a matter of expediency; not as a matter of right. That is what the two paragraphs—(a) and (b)—quoted from "Social Statics" in the draft appended to letter 40, taken by themselves, would seem to imply, and they are practically all that he ever said in that book about compensation. And yet Spencer strangely enough, in the draft letter, lumps these two quotations together, tho they do not fit each other, and offers them as evidence that he taught "that the private owner has a claim to all that value given to the land by clearing, draining, cultivation, and all the appliances standing upon it for carrying on food production." Here the idea of compensation for dispossession has vanished, and what do we find in its place? We find the idea of "improvements" lengthened out, as it is in "Jus-

tice," so as to include practically all that human labor has done to the land since the days of Adam!

Such being the view which Spencer latterly took of the landlord's right in the soil, no wonder he came to the conclusion that it would be a bad bargain on the part of the community to buy the landlords out on such a basis. The change it indicates is something more than a change of opinion as to the policy or impolicy of a certain legislative act; it involves a virtual surrender of the fundamental position he assumed respecting the people's rights in the soil. For tho he still clung to the doctrine of equal freedom, yet either that doctrine must be false, or else the above conclusion, which he says accords with it, must be false. A man who derives, as Spencer professedly does, his theory of right from considerations of what is for the greatest benefit of the community, cannot successfully plead that to embody that theory in fact would leave a balance of injury to the community.

But has this so-called "artificial value" any existence? All human improvements to land are evanescent in their nature; no sooner are they made than they begin to wear away, necessitating continuous care and labor to keep them in repair; the only thing that permanently survives is the indestructible power of the soil to afford standing room and nourishment to mankind, and this power every generation turns to account as it sees fit. Besides, whatever man makes he can also destroy, and only in so far as land can be destroyed can it be said to have had an artificial value given to it. Only to the same extent can it become the subject of private property. And were the work of destruction carried out to the utmost possible limits, so as to leave nothing but what the community has a clear title to, it would then be readily seen that the so-called "artificial value" which, according to Spencer, is the accumulation of thousands of years' labor, could be reproduced in a single generation, provided supply and demand had free scope for their activities.

Furthermore, the plea of compensation is directly at variance with Spencer's theory of property, and this, too, in the strongest imaginable case,—the case in which the landlord comes by his estate through purchase. For holding, as he does, contrary to Locke's view (and, strange to say, to that of George also) that property cannot be equitably acquired in the products of the earth until the rent for the use of the land had been paid to the community as supreme owner, how can a man acquire by purchase a right of property in the soil, seeing that the wealth wherewith he purchased it was drawn from the soil without complying with the condition which he says is necessary to make it his?

In "Social Statics" we find him declaiming as vehemently as George himself could have done against "the gigantic injustice inflicted upon nineteen-twentieths of the community by the usurpation of the soil,—by the breach of their rights to the use of the earth" (Chapter 21). We find him in Chapter 25 treating poor laws and communist proposals as "attempts to embody that thought which found its legitimate utterance in the law—all men have equal rights to the use of the earth," and pointing out "what a monstrous thing it was that nine people out of ten should live in the world on sufferance, not having even standing room, save by allowance of those who claimed the earth's surface."

All this, however, disappears in his later writings. If he still stands by his equal rights formula it is to tell us that it must never be carried out as regards the most important right which it is the object of the law to conserve. Have not the people forsooth acquired the supreme power in the State, which formerly belonged to the crown, and, therefore, are they not enjoying the supreme ownership of land which formerly vested in the crown? Yes, but the fact remains that ten thousand persons still own five-sevenths of the superficial area of Great Britain and are every bit as potent for evil as they were in the days when Mr. Spencer had no use for them; and in the United States the operation of an all but universal suffrage has not altered the fact that the poor in our large cities have no room to live, and that the absorption of the unearned increment by private individuals is giving rise to greater inequalities in the distribution of wealth than have ever before been witnessed. But, of course, nobody knew this better

than the man who said in "Justice" (Chapter 22) that "the acquirement of so-called political rights is by no means equivalent to the acquirement of rights properly so-called. The one is but an instrument for the attainment and maintenance of the other, and it may or may not be used to achieve those ends."

The plea that the proposed restoration of the soil to its rightful owners would involve (in the case of England) the making over of the land to the Celts of Wales and Scotland as being the descendants of its earlier inhabitants is so utterly puerile and unworthy of Spencer that one finds it hard to believe that it ever came from him. Equally lame and misleading is the argument respecting the poor laws. If in carrying out any proposed plan of restoration there was any intention of debiting the landlords with all the economic rent that they and their predecessors had ever received, and all the rent they might have received for land which they kept idle for their own selfish purposes, the landlords might properly offset the claim by the amount they had contributed to the support of the poor during the period covered, but nobody proposes any such scheme; the most rabid land reformers are satisfied to let bygones be bygones. In the field of philosophy at large Spencer was great, and his methods were unassailable; he weighed every fact and shrank from no conclusion to which it logically led; but here he is no longer the disinterested inquirer after truth; he has the manner of the special pleader, whose function is to make facts accord with ready-shaped conclusions. Hence the bungling and pettifogging nature of his new doctrines; doctrines which need only to be placed alongside his former noble utterances in order to show how worthless they are. "The rod of civilization is bent," says the earlier Spencer, in effect, "and we must bend it back so as to get it straight." But the later Spencer says, "No; if the rod is bent, let it stay bent." "At what rate per annum does wrong become right?" asks the earlier Spancer. "Oh! that's easy," says the later Spencer, "just count the years the wrong has been in operation; make that number the denominator; then write '1' above it for numerator; the resultant fraction gives the rate required."

It is impossible to resist the conclusion that as years went by he lost that warm sympathy with the struggling masses which oozes out from the pages of his earlier books. He tried to unsay some of the truths which he formerly said. But it was too late. They had already passed into history and are part of the heritage of future ages. They will continue to animate and inspire fresh seekers after truth, who will think of Spencer as he was when he wrote them; not as he was when he tried to blot them out.

NEWARK, N. J.

Snow Summits

BY GRACE DUFFIELD GOODWIN

Love is not all the valley and the rose;
Love is the Alpine peak, that lone and cold,
Rests uncomplaining in the steady hold
Of Honor's stainless and eternal snows.

Across renunciation's hight there glows
The light of stars that bring all Heaven near;
Who strives to this hath nothing more to fear.
Love is not all the valley and the rose.

PAWTUCKET, R. I.

Why I Do Not Marry

BY A BACHELOR MAID

[For some time we have been trying to secure an article which would help to explain the reluctance to enter into the matrimonial state so often manifested by intelligent and cultured women of to-day. The following frank and unconventional "confession"—if that word can be applied to it—from an attractive and able young professor in one of our universities is, we believe, a sincere exposition of opinions and feelings on this subject held by many others than the writer. We have commented on this article in our editorial pages this week, but fearing that such merely masculine opinion may be inadequate, we expect to print next issue a reply from Marion Harland.—EDITOR.]

CARRIE HENDERSON has been in the city for a three days' visit. We took dinner one evening with Mrs. Pendleton, and at table Mr. Pendleton and I found ourselves alone in a company of married women. Naturally they took occasion of this to discuss our respective species as seen from the matron's point of view. As to the masculine kind, things very shortly grew so hot that Mr. Pendleton retired precipitately to the cover of a cigar on the veranda, but I had the courage (or may be the curiosity) to sit through the coffee and the symposium upon the bachelor maid.

The conversation assumed a very personal character on this point. I learned among other things that the recent marriage of Professor Johnstone to a chit of nineteen had been a blow to Mrs. Pendleton, because from the moment when she first set eyes on him she had felt a conviction that he and I were made for each other. Carrie dissented from this, and asserted further that if Mrs. Pendleton had known me as long as *she* had, she'd have stopped long ago trying to marry me off to *anybody*.

That seemed to be the ultimatum so far as I was concerned. Young Mrs. Sanderson, who had only met me that morning, did put in a minority report to the effect that she knew a perfectly lovely young professor, who had just published a book, whom she'd like to have me meet before deciding irrevocably that matrimony wasn't in my line, but Carrie reiterated that my past had contained other lovely professors, not to mention theological students and similar likely specimens of mankind, and that if I couldn't show any practical results out of such material as had already come to my hand it was folly to entertain any farther expectations of me.

This conversation has given me some food for thought. For while it was clear enough that the general sentiment was to the effect that I never *would* marry, it was not so certain whether they thought that I *ought* to do it. One point upon which they practically agreed was of such a nature as to indicate that their view of my position was not wholly one of reprobation; indeed, I'm not sure that it wasn't a sort of indirect tribute to my intelligence. The company represented all stages of wifehood, from young matrons like Carrie to one the age of my mother, but they with apparent unanimity delivered the following verdict: that the only way to be a truly happy married woman was to be a fool. That was what they said—in plain English. Whether they wished themselves to be classed among the fools or the unhappily married considerations of delicacy forbade me to inquire. But this consensus of opinion came as a shock to me. For while I have long believed that the joys of wedded life must be of a transcendental sort only to be "spiritually discerned" by those on the inside, since they are so rarely obvious to the uninitiated spectator, I had not realized that ordinary intelligence was really an obstacle to that discernment. In fact, I recall that I have expended a considerable amount of breath and cerebral matter in arguing that the only ideal marriage would come when husband and wife stood on an equal plane in intellectual equipment and freedom to use it. Which shows once more how often people are vociferous concerning things of which their knowledge is as that of the new-born babe. Now, there-

fore, I am making no dogmatic assertions; I am just *wondering*—trying, as it were, to adjust my obstreperous instincts to the eternal forces of nature as seen in the light of this recent revelation. It seems, for one thing, to give fresh illumination to a little episode in connection with the last man I was engaged to. He was not a professor, nor yet a theological student, but most charmingly of the earth earthy. Of course, I now know that I never could have lived with him, but, just as a lover, he was—well, he was nice. And so clever! He humored all my little whims about "companionship" between husband and wife, and even anticipated me in the expression of many such opinions. To this day I can't understand how such genius finally came to overreach itself. Yet one night, under a peculiarly witching moon, he said, "But there is one thing I must insist upon, dear" (or perhaps he said "darling"—upon reflection I believe it *was* that); "whenever any questions of *judgment* arise in our married life my will must be supreme."

We had some rather heated argument. You see, he wasn't even a college graduate, and we were about the same age, and, as he himself had to admit, my profession is one presupposing the possession and exercise of quite as much "judgment" as his own, so that there didn't seem any very conspicuous reason why he should arrogate superiority in that line. I rather flattered myself at the time that I had the better of the discussion, but my recently acquired knowledge suggests that what I failed entirely to appreciate was that while I was developing some beautiful theories about what *ought* to be true he had based his contention upon the solid elemental conviction of man that the rôle divinely appointed for woman to play in the marriage drama is that of the fool. Far be it from me to say that 'tis not true. And I know that it is a dramatic tradition that the fool is ofttimes wiser than the sage. But somehow I do not find in myself any aptitude for playing this consummate part. The bald truth is that nearly every quality commmonly recommended for cultivation by the ideal wife is one that I lack—and do not wish to possess! I am not attracted by the triumphs of that art which manages a husband and yet leaves him in the unshaken conviction that he is managing you; I do not thrill with tender delight at the thought of "being taken care of"; I even lack that traditional instinct universally declared to be as essential a part of woman as any of her physical organs—the imperative need of a husband of such superior intelligence that he may be "looked up to." It is altogether heterodox, I know, but, honestly, if one of us has got to be a fool, I should enjoy a great deal more complacency in feeling that my husband was that one.

At once, upon such a declaration as this, I can hear the usual chorus of "sexless creature," "mannish woman," and like epithets, but I am no such thing, and no one who knows me has ever called me so. I bow to the dicta of my dressmaker as meekly as anybody; I am often actually "chummy" with little children, and I get on very well with the men, too. It seems a pity that our relations should be disturbed by this perpetual pother about my marrying one of them.

"Oh! just wait till the right man comes, and you'll marry him quickly enough."

That is what I have been hearing since my early teens, and I always assent to the proposition. But, dear friends, why is it that I fail to see in all the agreeable single gentlemen of my acquaintance one who is "right"? The trouble is, I dare say, that I am all *wrong*. But I protest that I must have been born that way, and if I am not a "normal woman" the defect must be congenital, and not the result of that higher education at which it is coming to be the fashion to look askance. Of course, my ideas about marriage have undergone modifications with the years, yet I can hardly remember when I did not dream of a life which should embrace more than a home and children. But I hasten to acquit both my parents and my college professors of any definite effort to fill my young mind with an aversion to the other sex or to an ultimate union with a member of it. My first and dearest playmate was a boy (and our equal fondness for dressing dolls and "playing circus" showed but the most embryonic consciousness of distinctions of sex). I went to school with boys, and had some of those same boys for sweethearts a little later. But we

made love much less often than we read Cicero together and struggled with problems in quadratics. To this day I have a grudge against one horrid boy (he has never made much stir in the world, either, it gives me pleasure to mention) who did undeniably do better in his geometry than I did—which is proof enough how I should get on with a "superior" husband. Now the outcome of all this was that I arrived at womanhood with a strong sense of *companionship* with men, coupled with an even stronger feeling that this companionship had grown out of common intellectual interests which should not end with our recitation-room days.

And so I've been in trouble ever since. Certain of the same young men whose studies I had shared (assisted sometimes, dare I add?) have with fervor and tenderness held out to me the alluring prospect of broiling their beefsteak while they went on with the studies. And I suppose that my whole disinclination to wed grows out of just this one thing: that I have been appalled by the hideous inequality of the conditions which marriage offers to the man and to me, when we have come up to the wedding point essentially alike in our past training and our ideals for the future. For to him marriage means the gaining of a home life which is an incentive and help to his chosen profession rather than an obstacle; but to me, if I would have love and a home, the alternative presented is the renunciation of every other dear ambition. Perhaps I have no right to have any other ambition, *but it is there,* and it has grown up with me. So far as I can discover, too, it is just the same sort of ambition that a man feels; not a thirst for a little cheap publicity as an "intellectual woman," much less the desire for a pseudo "independence" and an individual bank account, but an honest love for the studies of which my school-days gave me a glimpse, and of which the pursuit of my profession opens an ever widening vista. Now, that does seem to me quite as noble an ideal of life as Daisy Anderson's, who hasn't a thought on earth but her husband's dinners, her children's spring raiment, and how she may attain more expensive parlor curtains than Mrs. Brown across the street; and sometimes I get tired of hearing the pulpit and press call me names and laud her. But I might still survive their attacks without wincing appreciably if The One Man showed any disposition to realize the sacrifice that he is asking of me, and then to lessen it. *The* One will, I suppose; but meantime there have been two or three so nearly approximating that traditional "rightness" that I have narrowly escaped thinking that they would do; and yet the best of them have never, so far as I am aware, contemplated making me anything but their housekeeper, tho I do not doubt that they were perfectly sincere in their professed intention to make the emoluments of my position as generous as their circumstances would admit. Their positions in the matter, of course, have been more or less radical, according to the man. Howard Moore, for instance, assured me that he had selected me as the object of his addresses because he felt that certain of my accomplishments would be a great assistance to a man in his profession. Since the young woman in whom he later (not *much* later, either, considering how disconsolate he was) found consolation has made her most conspicuous tribute to his advancement in the form of an annual infant, I am at a loss to discover just what place for the display of intellectual graces is provided for in his scheme of married existence.

Very different was Harry Merrill, who admitted that he was jealous not only of what I wished to be but the little that I was. "The trouble with you," he sneered, in the quarrel which marked the close of our highly cyclonic betrothal, "is that you know too much. I can never excuse you, if you are my wife, from the domestic and maternal duties that you were *made* for." I had had quite a little experience previous to Harry, but never before in my life had the revolting consciousness been forced upon me as he forced it of what some men want a wife for. The married life of which I have permitted myself to dream contains a husband who may be an intellectual companion, who may be willing—even proud—to give me encouragement and inspiration to develop in my chosen field of work as I, in turn, would offer appreciative sympathy to him in his; what my various lovers have desired in me is, as it appears, a mother for their children.

I do not know how to express my feel-

ing upon this point and make it printable. It is just because of this difficulty that I suppose the denouncers of race suicide will always publicly get the better of the argument. Pious platitudes upon the beauty of large families, the glory of motherhood, *et id genus omne*, are susceptible of refined, even poetical, treatment, but the disgusting and unromantic conditions to this supposedly beatific result, which every woman must face—we may speak of them, guardedly, to our physicians, but we do not discuss them in polite society.

From the psychological and physical culture magazines I learn that men select their wives as they judge of stock at a fair, from the "points" which indicate their suitability for breeding purposes. So for my offers of marriage I may thank my physical conformation! This enables us to give a true definition to that much abused word "womanliness." It is a quality to be attained by gymnastic exercises! I dare not use words to express how it sickens me to see this perpetual forcing to the front of the physical element in a relation which perhaps but for it might be the beautiful thing which it now so manifestly is not. In the great bulk of this modern literature concerning the "complete" woman the sentiment, when reduced to its lowest terms, places the supreme object of a woman's married existence exactly in the light in which it figures in a certain class of patent medicine advertisements. Here, again, I suppose I need not mind what magazine writers and ministers of the Gospel are shrieking, provided Mr. Right One respects my feelings on the subject; but will he? So far as I can discover, even the most cultivated and broad-minded men are disposed to regard as a matter of course, a mere passing trifle, what it seems to me that every pure-minded woman must shrink from with a feeling which perhaps it can never enter into the heart of man to conceive.

I suppose it is unfortunate for my matrimonial prospects that I should ever have numbered Mrs. Cameron among my intimate friends. She is ten or fifteen years older than I, and so represents an epoch, as she does a section of country, in which it was quite natural that her doting father and brothers should discourage her wish to go to college with the plea that they could not bear to think of her undertaking anything so hard as a teacher's life. I wish I might tell the true history of the wedded life which, with the paternal and fraternal blessing, she has substituted for that. Since I may not, I wish that it were in my power to picture her face and voice as she has said to me:

"Hell? Do you think I can be afraid of it after the hell of my whole married life?"

If her husband had killed her once for all society would have enthusiastically haled him to the gallows or the dungeon. Because the death to which she has stood so near many times would have been ascribed, had it mercifully come to her, to the surgeon's knife, the man who has not hesitated to bring her there again and again goes unhung—even passes for a decent member of society. And yet I know, even if she had not told me, because I am a woman, that all her physical suffering is as nothing beside the unspeakable humiliation which she has endured through twenty years of enforced surrender to a man who is her inferior save in the one all-important quality of brute force.

Of course, I don't imagine that all men are Mr. Camerons, and yet I observe that the wives of many better men do not fare very differently. There is Mrs. Abbott. She was a college professor before she came here a bride four years ago, and I fancy an unusually clever woman, but I do not feel very well acquainted with her, for she has never returned any but my first call. I cannot blame her for this, however, since she is even now receiving congratulations upon the advent of her third baby. I hope, I'm sure, that she considers it a cause for congratulation, but to my mind it is strange reasoning which urges that such a woman is offering her best possible service to society and her country thus imprisoned in a nursery, her mental activity perpetually hampered by endless domestic burdens and bodily pain, while her brilliant and attractive husband (I can't help liking him myself) is lionized in every literary and social circle. If it is the false ideal established by my college education which makes me rebel against this making of woman a mere reproductive ani-

mal, why does the uneducated non-society woman fret against it too? Only the other day I read a newspaper's brief notice of the sending of a poor woman to the State hospital for the insane, to which was appended the laconic comment, "She is about forty-two years old, and has nine children." I can only conjecture the cause of her insanity, but there was no uncertainty in the case of poor Mrs. Lane, who lived across the street from us. Everybody knew why she lost her reason, and her husband knew it, too, but each time that she was sent back from the asylum there was a new baby, until she had the good fortune to die in the birth of one.

I am not prepared to say that I absolutely refuse to accept the charge of motherhood, but I do refuse—and I have no words to express the loathing with which I regard the idea—to be looked upon as a mere means of swelling the census report. Stripped of its fine language, that is what all this prating of the beauty of large families amounts to. I do not believe that there is, or ever has been, a large family which resulted from anything so high-minded as the deliberate desire of *both* parents to rear good citizens for the State. That some members of such families do turn out valuable citizens proves nothing more in their favor than the occasional fact that some woman, like Elizabeth Cady Stanton, may have the mental and physical strength to achieve something in spite of her numerous children. So far as my circle of acquaintance goes, there is precious little foundation in fact for the repeated assertion that the rearing of children develops the noblest qualities in woman. The notion, I suppose, is the result of the eternal fallacy of assuming a necessary relation between mere suffering and self-sacrifice. Were the two identical, it might increase our chances of heaven to get ourselves smashed up in a railway accident or trampled in a theater fire; but as being parboiled or maimed has not proved noticeably a means of grace to the victim after his dismissal from the hospital, so I have failed to discover in the pangs of maternity anything tending to the regeneration of the mother of ten children. If I may have children decently—which is to say, if *I* may have the right to decide when and in what numbers they may come—I may perhaps as a married woman feel that they more than repay the suffering attendant upon motherhood, since under those conditions that suffering will not be sharpened by loss of my self-respect. But if, on the other hand, I should still feel as I am inclined to now, that I am one of that class of women who can do more for the world, and have their own lives more complete, by following a career which does not admit of the restrictions of motherhood, I shall expect the Right Man to acquiesce in my views, no matter what may be the criticism of a clamorous public. And he will, if he be, indeed, "right." But I do not count much upon finding him, because I seem to have looked over the assortment pretty thoroughly already.

And so, until society can furnish a supply of marriageable men in whom a cultivated intellect is combined with a meek and lowly spirit, I suppose that I am likely to go on my celibate way rejoicing, while, so far as I am concerned, the Opposition will have to continue to find relief in tears over the destruction of the American home.

When You Meet the President

BY DAY ALLEN WILLEY

[Mr. Willey is a contributor to a number of the principal American and English magazines of articles on industrial, financial, political and miscellaneous topics. He is a frequent visitor to the capital in obtaining data for his efforts, and has been in a position to observe closely the personality of Mr. Roosevelt in the daily routine of his official life. The description is merely intended to show just how the President appears to the visitor who may have occasion to call upon him.—EDITOR.]

THERE are two entrances to the President's room, as the White House *attachés* term it. Members of Congress, a few other officials and intimate friends may pass through the private entrance, their cards being handed in by the President's doorkeeper. The other way to reach him is through the Secretary's office, but only those who have an errand worth the while get beyond this apartment. The number of people whose names are given the Secretary weekly, but who do not see his superior, runs into the hundreds, for the term "Secretary" in Mr. Loeb's case means timekeeper, and the hours he saves daily are indeed golden, so many are they.

But perhaps you are among the favored. Preceded by the Secretary, you walk into the big, square room, in which a man is sitting behind a flat-top desk, which looks as if it might be mahogany. You have no time to decide, for as the name is pronounced the man rises with outstretched hand which grips, not grasps, yours. It is the sort of handshake that makes you feel the owner meant it by its heartiness. Then he resumes his seat, turns so he can look you squarely in the face, and is ready to hear what you have to say.

If you are puzzled how to begin—perhaps are a trifle nervous—he may surprise you by putting a question or two which strikes right at the point of what you ought to tell, for the Secretary has given him a hint in advance as to why you have come, and perhaps an idea of the actual importance of your visit. Thus prompted you begin to talk. So long as the conversation is confined to the subject in hand the President may say nothing, but if it slips away he may ask a question which brings you back into the right track again, and, unconsciously, the visitor forgets personality in the theme on which he is talking, and after it is all over he may be surprised at how much he has said, considering the time in which he said it. Such is one impression; but while talking the camera of his mind is busy taking photographs—and some of them are so different from the kind we see in the shop windows, the newspapers and magazines. Perhaps you have entered the room expecting to see a human illustration of perpetual motion—running his fingers through his hair, pacing the floor with hands in pockets, shifting from side to side in his chair, fingering the ink bottle or drumming with his pencil. The paragraphers and cartoonists may have led you to believe that the President tries to do all at once, judging by some of the accounts of his activity.

Not a bit of it.

His nerves are so steady that he doesn't even twirl his fingers, and if you note closely you will see that not a muscle of his features twitches. It is just the activity of which so much has been said—the wielding of the ax, the swinging of the clubs, the bouts with the single stick, the mile after mile of trudging through the woods or on the back of the sure-footed "Blestein," have given him a steadiness of nerve that many a man would covet more than his fortune—the nerve that comes from good digestion, sound sleep and plenty of red blood. Resting himself comfortably against the back of his chair, with hands quietly folded or one stretched carelessly on the desk, his attitude is anything but restless. When he joins in the conversation the words are uttered slowly, distinctly, unless the theme especially interests him. Then he may put an emphasis to them which tells you more plainly than the language that he means what he says. If it is worth while he takes a heart in-

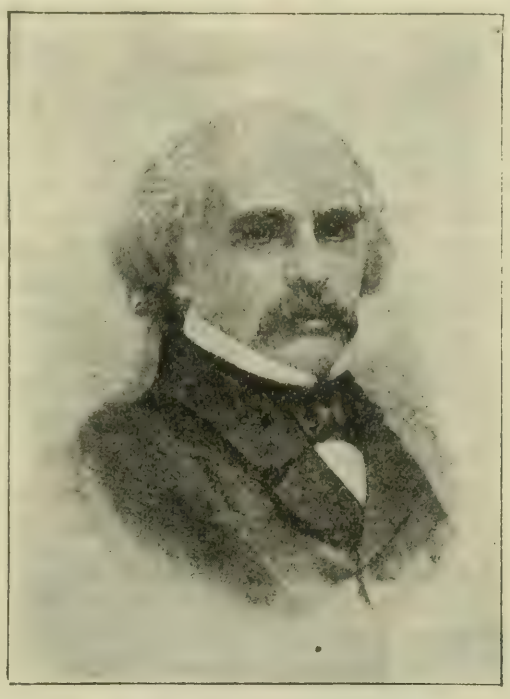
terest in the talk. If an idea especially pleases him, perhaps the visitor will hear something like this, "I think that is *admirable,*" or "That is *certainly* encouraging," with the special emphasis on the words italicized. But he is not a flatterer. If he does not agree with you he tells you so pointedly. If he does not care to hear more of a subject, he gives the thread of the conversation a sudden twist, and you understand.

But there is one thing that your camera will not reproduce, no matter how sharp its lens may be focussed—the tone of his voice in ordinary conversation. Probably its effect is heightened by his manner—that of one so accustomed to being a gentleman that this trait is displayed unconsciously. As you glance at the features browned, not bronzed, by exposure, and the sturdy, almost massive physique, the softly modulated tones surprise you. It is the sort of a voice to attract a woman—such as one might expect to hear in the drawing room, but hardly in a public office. There is no inflection of authority, no brisqueness in it which one accustomed to talking to prominent men so often notes. Yet it is not the suave tone of the politician, nor is it effeminate. Possibly the President believes that the etiquet which should be observed in the society of ladies should be followed in his relations with his visitors and official family. Probably no one has ever heard him order any one, even a messenger, in the ordinary sense of the word. His orders are in the form of requests. The interview may be interrupted while he summons the Secretary: "Mr. Loeb, I shall be obliged to have you attend to this," or, "Mr. Loeb, I must get you to do that," is the way he puts it. Is it any wonder that the Secretary's nerves are constantly strained for fear something may happen that may cause the President a little discomfort—just a little slip in the movement of the White House business mechanism?

If you have had time to glance at the desk you may see that it is bare of even a card—no piles of letters, no litter of documents, no packages done up in red tape. Needless to say the polished top does not reflect a speck of dust. Any one who never heard of Mr. Roosevelt might think the desk was merely ornamental. In fact, the office contains no indication of business, and its only regular occupant is the man in the chair. The head of seventy million people has not even a stenographer in attendance; but, as already stated, the interview may be interrupted. There is a paper which must have his personal signature at once. It may save a life, it may end a life, but the signature is placed there firmly without hesitation, for the signer knows the contents of every document which his pen touches, and its strokes are not made thoughtlessly. But you can talk to him while he dips his pen in the ink. If you stop, he tells you to go on; and there is an interesting fact about the signature. Look at it through a microscope and you could not detect any difference in the shape of the letters from the way he formed them when merely Assistant Secretary of the Navy. The lines do not follow the artistic curves of the Spencerian system, and the writer does not hesitate to use plenty of ink, but the handwriting expert says the signature indicates character. Apparently it is written slowly, but its appearance is deceptive, for the President is a rapid penman.

Another impression is made upon you, but this may not be recalled until with another handshake and bow the man behind the desk ends the interview and turns to greet the next caller. Perhaps you have read of the audiences at Windsor or Buckingham, or in the Elysee, where the head of another republic receives his visitors with the pomp of a monarch. Here you have merely walked into a building, at the entrance of which is a couple of doorkeepers, no rows of liveried footmen, no files of soldiers, no sign of a guard, save the solitary police officer pacing his post. You follow your card from the anteroom into the Secretary's office. You follow the Secretary into the President's room. You talk to the President as you would to any private citizen. He talks to you as man to man, with this difference—he may treat you with more courtesy and cordiality than some you have met in private life.

As you go away thinking it over, somehow it makes you glad you are an American.



BALTIMORE, MD.

Hawthorne: Looking Before and After

BY PAUL ELMER MORE

[On the Fourth of July, at Salem, Mass, at Bowdoin College and elsewhere in New England, will be celebrated the centenary of Nathaniel Hawthorne's birth. We accordingly print this week the following article from Mr. More, till recently the Literary Editor of THE INDEPENDENT, and now the Literary Editor of the New York *Evening Post*.—EDITOR.]

NATHANIEL HAWTHORNE was born just one hundred years ago, and, by a happy coincidence, the one artist who worked in materials thoroughly American and who is worthy to take a place among the great craftsmen of the world celebrates his nativity on the birthday of the nation. By something more than a mere coincidence he lived and wrote at the only period in the history of the country which could have fostered worthily his peculiar genius; he came just when the moral ideas of New England were passing from the conscience to the imagination and just before the slow, withering process of decay set in. As I read his novels and tales to-day, with the thought of this centenary in my mind. the inevitable comparison arises with what preceded and what exists now; he stands as a connecting link between old Cotton Mather and—*magna cum parvis*—Mary Wilkins Freeman, and only by looking thus before and after can one get a clear idea of his work.

NATHANIEL HAWTHORNE
Courtesy of Houghton, Mifflin & Co., Boston

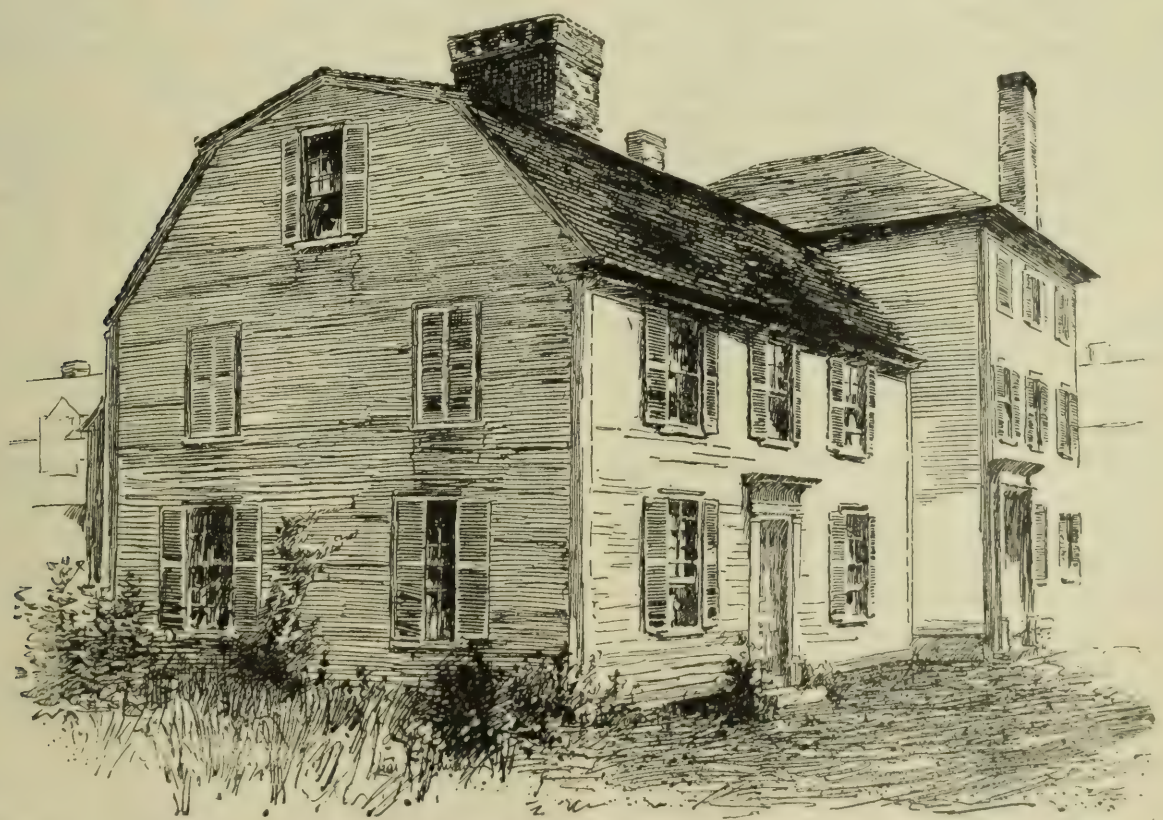
It seldom happens, in fact, that the history of a country shows so logical a development as that represented by these three names. To look backward, almost all of Hawthorne may be found in germ in the group of ecclesiastical writers among whom Cotton Mather rises preeminent, and he in turn is but a spokesman of that half-civilization which migrated across the Atlantic under the pressure of the Laudian persecutions. I say half-civilization, for the beginnings of New England took place when the mother country was split, as no people in the world ever before was divided, not by sectional but by moral differences into two hostile parties; nor do we always remember how largely the brilliant flowering and quick decay of New England depend on this incompleteness of her origins. Especially is this true in literature. Read through the critical essays that were written in the Elizabethan and Jacobean ages and you will be struck by the fact that the most serious debate was whether poetry had any right to exist at all. That discussion, of course, is as old as Plato and was taken up by the Italians of the Renaissance as part of their classical inheritance. But in England the question was not academic, but vital; it came to the actual test of battle. As early as 1579, in the very first bloom of that "perpetual spring of ever-growing invention," Stephen Gosson dedicated to Sir Philip Sidney his "School of Abuse," which he aptly describes as "an invective against poets, pipers, players, jesters and such-like caterpillars of a Commonwealth." "The fathers of lies, pipes of vanity, and schools of abuse," to use another of the crabbed Gosson's phrases, remained snugly in the mother country,

along with those who thought it possible to worship God with the homage of the imagination, who made of religion, in fact, a fine sense of decorum in the ordering of creation. The wonder might seem to be that any literature at all ever sprang from the half-civilization that came to New England, or that any sense of art found root among a people who contemned the imagination as evil and restricted the outpouring of emotion to the needs of a fervid but barren worship. The root was indeed long in coming to flower, yet there are passages in the "Magnalia" of Cotton Mather both exquisite in themselves and indispensable for a right understanding of what was to follow. There is, for example, that famous account of the death of John Cotton, worth of repeated quotation:

"After this in that *study*, which had been *perfumed* with many such *days* before, he now spent a *day* in secret *humiliations* and *supplications*, before the Lord; seeking the special assistances of the Holy Spirit, for the great work of dying, that was now before him. What glorious *transactions* might one have heard passing between the Lord Jesus Christ, and an excellent servant of his, now coming unto him, if he could have had an *hearing place* behind the *hangings* of the chamber, in such a day! But having finished the duties of the day, he took his leave of his beloved *study*, saying to his consort, *I shall go into that room no more!*"

That is the positive side of the ideal, and it is a dull heart to-day that can read this story of rapt holiness without a thrill of wonder and admiration. But the negative side is close at hand. The same annalist records of another of his family, Nathaniel Mather, a little incident that shows how inveterate was the suppression of the easy enjoyments and emotions of life. The quotation is from Nathaniel's diary:

"When very *young* I went astray from God, and my mind was altogether taken with *vanities* and follies; such as the remembrance of them doth greatly abase my soul within me. Of the manifold sins which then I was guilty of, none so sticks upon me, as that being very young, I was *whittling on the Sabbath-day;* and for fear of being seen, I did it behind the door. A great reproach of God! a specimen of that *atheism* that I brought into the world with me!"



One may be inclined to smile, perhaps, at this early intrusion into sacred literature of the Yankee's proverbial trick of whittling, but he will be more apt to marvel at the austerity of a discipline which could associate this childish escapade with life-long remorse and horror. No wonder that melancholy hovered over that chosen land. To quote from the "Magnalia" once again:

"There are many men, who in the very constitution of their *bodies*, do afford a *bed*, wherein busy and bloody *devils*, have a sort of lodging provided for them. . . . 'Tis well if *self-murder* be not the sad end, into which these hurried people are thus precipitated. *New England*, a country where *splenetic* maladies are prevailing and pernicious, perhaps above any other, hath afforded numberless instances, of even *pious people*, who have contracted those *melancholy indispositions*, which have unhinged them from all service or comfort; yea not a few persons have been hurried thereby to lay *violent hands* upon themselves at the last. These are among the *unsearchable judgments* of God!"

It is not fanciful, I think, to find in these three passages from the greatest of the early New England divines the ideas that were in due time to blossom into a true and peculiar literature. That isolation from the world and absorption in an ideal that signalized the death of John Cotton was to leave an echo in many lives that were to follow. The inability to surrender to the common expansive emotions of human nature and the dark brooding on damnation did not utterly die out when the real cause ceased to act. They changed, but did not pass away. When, with the coming of the nineteenth century, the fierce democracy of those Northern States asserted itself against priestly control and at the same time shook off the bondage of orthodoxy, it only moved the burden from one shoulder to the other, and the tyranny of conscience became as exacting as the authority of the Church had been. But this shifting of the center of authority from without to within was at least fruitful in one important respect: it made possible that other change from the conscience to the imagination which created the only serious literature which this country has yet produced. In that shift from the conscience to the imagination lies the very source of Hawthorne's art. The awful reality of the old faith still reverberates in his stories of New England life and gives them their depth of consciousness; the

dissolving of that straitening reality into the forms of a subtle symbolism lifts them from the sphere of provincial importance to the claims of universal art.

Nor is it at all difficult to follow the religion of the seventeenth into the art of the nineteenth century. In an earlier essay on "The Solitude of Nathaniel Hawthorne" I pointed out—what must be plain to every reader of that author—the central significance of his "Ethan Brand" in the circle of his works. So manifestly do the doctrines of Cotton Mather stalk through that tale under the transparent masque of fiction that it might almost seem as if Hawthorne had taken the passages just quoted from the "Magnalia" as a text for his fancy. For the first quotation, in place of the rigid theologian "perfuming" the bleak atmosphere of his study with meditations on the great work of dying orthodoxly, we have Ethan Brand, the lime-burner, dwelling in the fragrant solitude of the mountains, watching his kiln through the long revolutions of the sun and the stars, perplexing his mind with no problem of predestination and free-will, but with the meaning of life itself, with its tangle of motives and restraining intelligence. For the second quotation, in place of a narrow remorse over one act of rebellious surrender to impulse against the arbitrary dictates of religion, we have a strange reversal of Puritan faith through the lens of the imagination. Ethan Brand returns to his long-abandoned lime-kiln after wandering over the world, bringing with him the sense that he has sought and found at last in his own heart the Unpardonable Sin, the sin of banishing from the breast all those natural, spontaneous emotions in the pursuit of an idea. He bears the mark, not of an artificial atheism, like that which abased the soul of the young divine, but of that ananthropism (if I may use the word) which was the real sin of New England, symbolized by the strange nature of his successful search. "He had lost his hold of the magnetic chain of humanity. He was no longer a brother-man, opening the chambers or the dungeons of our common nature by the key of holy sympathy, which gave him a right to share in all its secrets; he was now a cold observer, looking on mankind as the subject of his experiment." There lies not the tragedy of Ethan Brand alone, but of the later New England. The dogmas of faith had passed away and left this loneliness of a meaningless idealism; the religion which

Birthplace of Nathaniel Hawthorne, Union Street, Salem.—The room in which Hawthorne was born is that above the one at the left of the front door

had strangled the kindly emotions of the day has succumbed, and the contempt of the human heart has given place to this intolerable loneliness.

And last of all there is the "splenetic malady," the melancholy that pursues this thwarting of nature and drives the wanderer to lay violent hands on himself. The burning of Ethan Brand in the lime-kiln, within the circle of whose crimson light he had pondered the Unpardonable Sin, is not, in the sense of Cotton Mather, one of the unsearchable judgments of God, but an easily conceived device of literary art.

This is the second act of the New England drama, and the third proceeds from it as naturally as the second proceeded from the first. From the religious intolerance of Cotton Mather to the imaginative isolation of Hawthorne and from that to the nervous impotence of Mrs. Freeman's men and women is a regular progress. The great preacher sought to suppress all wordly emotions; the artist made of the solitude which follows this suppression one of the tragic symbols of human destiny; the living novelist portrays a people in whom some native spring of action has been dried up, and who suffer in a dumb, unreasoning inability to express any outreaching feelings of the heart or to surrender to any common impulse of the body. It is true, of course, that Mrs. Freeman describes only a single phase of New England character, just as Hawthorne did before her; but the very genealogy of her genius shows that she has laid hold of the essential trait of that character, and, indeed, it needs but little acquaintance with the stagnant towns of coast and mountains to have met more than one of the people of her books actually in the flesh. Her stories are not tragic in the ordinary sense of the word; they have no universal meaning and contain no problem of the struggle between human desires and the human will, or between the will and the burden of circumstances. They are, as it were, the echo of a tragedy long ago enacted; they touch the heart with the faint pathos of flowers pressed and withered in a book, which, found by chance, awaken the vague recollection of outlived emotions. They are very beautiful in their own way, but they are thoroughly provincial, just as the treatises of Cotton Mather were provincial; they have passed from the imagination to the nerves.

Already in Hawthorne we find the beginnings of this strangely repressed life. Hepzibah Pyncheon, struggling in an agony of shame and impotence to submit to the rude contact of the world, is the true parent of all those stiffened, lonely women that haunt the scenes of Mrs. Freeman's little stage. Only there is this signal difference: Poor, blighted Hepzibah is part of a great drama of the conscience which in its brooding over the curse of ancestral sin can only be compared with the Atë of the Æschylean theater. All the characters that move within the shadow of that "House of the Seven Gables" are involved in one tragic idea assimilated by the author's imagination from the religious inheritance of the society about him—the idea that wrong-doing works out its penalty in the separation of the doer from the common heart of humanity. But in Mrs. Freeman's tales this moral has utterly vanished; they have no significance beyond the pathos of the lonely desolation depicted. Her first book, "A Humble Romance," is made up of these frustrate lives, which are withheld by some inexplicable paralysis of the heart from accepting the common joys of humanity, and her latest book, "The Givers," appeals to our sympathy by the same shadow of a foregone tragedy.

Very characteristic in the first book is the story of the "Two Old Lovers." There was nothing to keep them apart, none of the well-used obstacles of romance in the shape of poverty or tyrannous parents or religious differences or an existing alliance—nothing save the ingrown inability of the man to yield to the simple call of his own bosom. For many years he visits the girl and, as time passes, the aged woman, as an accepted but curiously undemonstrative lover. There is, to me at least, a pathos close to tears in the watchfulness of the waiting woman over her diffident wooer.

"She saw him growing an old man, and the lonely, uncared-for life that he led filled her heart with tender pity and sorrow for him. She did not confine her kind offices to the Saturday baking. Every week his little house was tidied and set to rights, and his mending looked after. Once, on a Sunday night, when she spied a rip in his coat, that

had grown long from the want of womanly fingers constantly at hand, she had a good cry after he had left and she had gone to her room. There was something more pitiful to her, something that touched her heart more deeply, in that rip in her lover's Sunday coat than in all her long years of waiting. As the years went on, it was sometimes with a sad heart that Maria stood and watched the poor lonely old figure moving slower than ever down the street to his lonely home; but the heart was sad for him always, and never for herself."

Only in the end, when he lies dying in his solitary house and she is summoned to his bedside, does the approach of the great silence of death unlock the dumbness of his breast.

"He looked up at her with a strange wonder in his glazing eyes. 'Maria'—a thin husky voice, that was more like a wind through dry cornstalks, said—'Maria, I'm—dyin', an'—I allers meant to—have asked you—to—marry me.'"

Is it fanciful to say that this story has the shadowy pathos of emotions long ago fought against and overcome? The tragedy of New England came when Hawthorne wrought the self-denial of the ancient religion into a symbol of man's universal isolation, when out of the deliberate contemning of common affections he created the search for the Unpardonable Sin. In the pages of Mrs. Freeman we hear only an echo, we revive a fading memory, of that somber tragedy. "Ethan Brand" was a problem of the will, a question of morality; the tale of the "Two Old Lovers" is a sad picture of palsied nerves.

The latest volume of Mrs. Freeman's sketches treats the same theme, with this difference, however, that here it is the woman who abandons her lover for many years, returning to him only when both are grown old and past the age of spontaneous pleasures. There is perhaps some softening of tone, a kindlier feeling that into this strange desolation of the heart some consolation of the spirit may descend with chastened joy. Hardly in the earlier books, I think, will one find any picture of the possible mellowing effect of solitude comparable to this description of the waiting lover:

"He was a happy man, in spite of the unfulfilled natural depths of his life. His great sweetness of nature had made even of the legitimate hunger of humanity a blessing for the promoting of spiritual growth. It had fostered within him that grand acquiescence which is the essence of perfect freedom."

But beautiful as this grand acquiescence may be, it is not in that direction lies the real freedom of New England life or literature. Rather shall the deliverance come in the way hinted at in that other phrase, the hunger of humanity. The whole progress from Cotton Mather to Mrs. Freeman was determined by the original attempt to stamp out that legitimate hunger for the sake of an all-absorbing ideal of the spirit. And now, when the spirit, having succeeded in the long warfare, has itself starved away and left the barrenness of a dreary stagnation, the natural reversal may well be looked for, and we may expect the hunger of humanity to grow up out of the waste, unchecked by spiritual aims. Already in the New England of Hawthorne, in the exaggerated sentimentalism of the abolitionists and a thousand other reforming sects, this movement had begun. Hawthorne himself, despite his humorous insight and his aloofness from the currents of life about him, did not wholly escape this influence. Through the dark pages of "The House of the Seven Gables" moves the cheerful figure of young Holgrave, the daguerreotypist. To him, says Hawthorne, thinking no doubt of the burden that weighed on his own imagination, it seemed "that in this age, more than ever before, the moss-grown and rotten Past is to be torn down, and lifeless institutions to be thrust out of the way, and their dead corpses buried, and everything to begin anew." There is a world of significance in the analysis which follows of Holgrave's restless and ardent nature, of his generous impulses, that might solidify him into the champion of some practicable cause. He is the type of a whole race of men who were to take revenge on the despotism of the spirit by casting it out altogether for the idealized demands of the hunger of humanity.

But what was foreshadowed in Hawthorne becomes the one dominant human note of Mrs. Freeman's stories, heard through the desert silence that otherwise encompasses her characters. This vision of a growing humanitarianism that shall awaken new motives for healthy, active life and feed the hunger of the heart is

the real theme of the strongest of her long novels, "Jerome." There is a scene in that book where the hero, beaten and marred by hard circumstances, suddenly gives vent in his awkward, unschooled manner to the late-born recalcitrance against the long preaching of an austere Providence:

"What was it to the moon and all those shining swarms of stars, and that far star-dust in the Milky Way, whether he, Jerome Edwards, had shoes to close or not? Whether he and his mother starved or not, they would shine just the same. . . . He was maddened at the sting and despite of his own littleness in the face of that greatness. Suddenly a wild impulse of rebellion that was almost blasphemy seized him. He clinched a puny fist at a great star. 'Wish I could make you stop shinin',' he cried out, in a loud, fierce voice; 'wish I could do somethin'!'"

And then, later, comes the companion scene, again under the cold eyes of the heavens, when the final determination takes shape before him and he sees at last something to do.

"A great passion of love and sympathy for the needy and oppressed of his kind, and an ardent defense of them, came upon Jerome Edwards, poor young shoemaker, going home with his sack of meal over his shoulder. Like a bird, which in the spring views every little straw and twig as toward his nest and purpose of love, Jerome would henceforth regard all powers and instrumentalities that came in his way only in their bearing upon his great end of life."

We have followed the development of that half-civilization that molded New England from the religious enthusiasm of Cotton Mather, through the tragic art of Hawthorne, to the pathetic paralysis portrayed in these stories of a living writer. We have seen a morbid spirituality, spurning the common nourishment of mankind, slowly starve itself into impotence. Now, as the hunger of humanity begins to assert itself unhampered by any vision beyond its own importunate needs, are we to behold a new ideal create in turn another half-civilization, blindly materialistic as its predecessor was harshly spiritual? That question may not be lightly answered. Only it is clear that, for the present, the way of growth for the literature of New England lies through the opening of this door of strictly human activity.

New York City.

Chips from the Workshop of the Evangelists

BY BENJAMIN W. BACON. D.D.

[The following article by the Professor of New Testament Criticism and Exegesis at Yale University discusses the "New Sayings" of Jesus discovered at Oxyrhynchus, published the other day by the Oxford University Press.—Editor.]

THE first few days' consideration of the enigmatic and mutilated fragments the sands of Behnesch have again yielded to the search of the Egypt Exploration Fund are obviously insufficient for a decisive verdict on either their exact meaning or their relation to the general stream of Gospel tradition. Beyond what the editors have already given in the way of careful adjustment of the mutilated scraps, conjectural restoration of the missing words, and general reflection on date and literary history, conclusions aided by the suggestions of such scholars as Fr. Blass, Rendel Harris, Vernon-Bartlet and Professor Lake, it is impossible to advance with precipitancy. Advance will certainly be made; possibly some corrections can be made at once, some new suggestions obtain immediate adoption, but the further light which critical scholarship can shed will for the most part come slowly, as in the case of the fragment discovered in 1897. First impressions should, therefore, be both cautious and concise;

and double conciseness is imposed by editorial limitations.

The greatest perplexity concerning the fragment of 1897 (designated *2*) was to determine the nature of the compilation of which the discovered leaf (p. 11 of the codex) formed part. Each of the new discoveries, the new fragment (*1*) of Logio (for thus they are called in the superscription itself), probably from this same compilation, tho a different copy, and the fragment of an unknown Gospel (*3*), throws light upon this and upon the general problem.

Next to Luke 1: 1-4, our oldest and most trustworthy information on the beginnings of Gospel writing is the tradition of "the Elder," reported by Papias, which specifies two types of evangelic composition (1) *Logia* of the Lord, and (2) *Narratives* of things both said and done by him. In the region of this "Elder" (in the present writer's conviction, Palestine, the Elder being probably John, "Elder" of the Church of Jerusalem, whose death is dated by Epiphanius in 117 A. D.), the authoritative representatives of these two Gospel types were attributed respectively to Matthew and to Mark, the second being at least nearly related to our Mark, the first a "Hebrew" compilation, doubtless underlying in part the discourse material of our Matthew. The reason for this twofold division lies partly in the practical needs of the Church, partly in its accustomed methods. The historical, more strictly historico-apologetic, interest of the double work, Luke-Acts, is a later development. Originally the Church employed its traditions of the Lord for two purposes: conversion and instruction. And the material employed corresponds to the needs of the hearers. Where these are unbelievers, or imperfectly acquainted with the story of the Nazarene Messiah, the preaching necessarily takes the form of Peter's sermon in Cæsarea (Acts x: 36-43), well designated "the Shorter Gospel of Mark." Its elements are the Baptism, or Vocation to the Messiahship; Ministry of the Holy Ghost and power, delivering those oppressed of the Devil; the Passion, Resurrection and Commission of the Twelve. Where the hearers already belong to "the Way," the elements of preaching consist naturally for the most part of the *precepts*. Jesus had given the "new commandment," the "royal law," the ultimate and authoritative exposition of of the Torah, setting forth "the righteousness of God."

And custom inherited from the synagog made this division natural. The former, or missionary, type is Haggada, religious "narrative," for edification; the latter is Halacha, the "way," authoritative precept for practical observance.

The three fragments from Oxyrhynchus, two of them "Words of Jesus the living (Lord?)," which, "if a man hearken to he shall never taste of death"; the other, a narrative in the third person, partly paralleling Luke xii: 22-27, show that here in Egypt, at a time, or at least in a community in which the canonical Gospels had not yet superseded cruder forms, the same methods were in vogue.

So long as Harnack's explanation of the utter disconnection of the Sayings of fragment *2* (1897) as a mere series of extracts from the "Gospel to the Egyptians, or some similar last work, seemed probable, the inferences drawn by the present writer (along with others) in THE INDEPENDENT for July 22d, 1897, hung in suspense. The vital importance of the present discovery of the opening lines of the collection is that in some degree it justifies the title "Logia," in spite of its somewhat ad captandum flavor. The writer who describes the disconnected Sayings consecutively introduced by the simple formula "Jesus saith" as "words which Jesus the living . . . spake to . . . and Thomas, and he said unto (them) Every one that hearkens to these words shall never taste of death," is not a mere excerptor. His Sayings are Halachoth, precepts for the Way of eternal life, only instead of being practical, like the *Two Ways*, they are mystical, like the Fourth Gospel. The attitude is that of John vi: 68, and still more exactly of John viii: 52, a passage not so much imitated as unconsciously paralleled. While the impression of disconnection still remains, it diminishes as we note that the immediately ensuing first Saying is a parallel to the well-known agraphon: "He that wonders shall reign, and he that reigns shall rest."

It is an exhortation to him who seeks . . . not to cease until he find his rest in the kingdom.

The mention of "Thomas" as special authority for these precepts, whether preceded or not by some other (in that case "Philip" is more probable than "the disciples," Mark xvi: 7) is of the highest importance. It connects this literature with that known to us as in circulation in Egypt in the second century, and employed by second century Gnostics under the titles "Gospel of Thomas," and "Gospel of Philip." The more and more legendary, fantastic or heretical literature, which in later times appropriates the lesser apostolic names, represents the degeneration of early tradition. Once it was only independent of the canonical; later, unprotected by canonical standing, it became hopelessly vitiated. What Polycarp and Papias protest against as the credulous folly of the multitude and the strange commandments of the false teachers soon made havoc of the independent tradition. But in our present fragments, as in those of the quasi-canonical "Gospel, according to the Hebrews," we get far enough back toward the headwaters of this troubled stream to seriously raise the question of authenticity. The Egyptian Church, at least in some branches, revered as its own distinctive authorities for a distinctive, to some extent independent, Gospel tradition, Philip (Acts viii: 26-39) and Thomas. There is little enough in the Oxyrhynchus fragments to suggest even indirect connection with any Apostle; but does not the effort to claim at least some subordinately independent apostolic authority stand for a truth? The internal evidence shows paralleling of the canonical stream rather than dependence on it. Unfortunately for the value of the independent material, its loose structure has already admitted on the other side a large admixture of Neo-Platonism and popular theosophy, if not of true ascetic Gnosticism.

This is most apparent in *3*, the fragment of a lost Gospel. From the "Gospel acc. to the Egyptians" to the Shaker doctrines of our own time, the tendency to connect the teaching of Jesus with the Story of the Fall (Genesis ii-iii) has been persistent in the mystically disposed. More than once it has led to outrages on decorum. The Paradise Lost was the state of nature, when man was "naked and unashamed." The Paradise Regained must be a return to this state of (sexless) nature. Perfect purity and perfect simplicity was the cry. In the "Gospel acc. to the Egyptians" Salome's question, "How long shall death prevail?" was answered, "So long as ye women bear children." Her question as to the time of Parousia, "When ye trample upon the garment of shame; when the two become one, and the male with the female neither male nor female;" or, as we have it in II Chron. xii: 2, "When the two shall be one, and the outside as the inside, and the male with the female neither male nor female" (cf. Gal. iii: 28). The new fragment employs the teaching of Luke xii: 22-32 in the interest of this mystical doctrine of the Paradise of innocence regained. Our editors seem to be strangely puzzled by the phrase, "He himself will give you your garment," even proposing to amend δώσει to δώσω (!). The context should leave no doubt: "Ye are far better than the lilies which grow but spin not. Having one garment what do ye (lack? . . . Who could add to your stature? He himself (sc. He who gives beauty to the lilies and growth to them and you) will give you your garment. His disciples say unto him: When wilt thou be manifest to us, and when shall we see thee? He saith, When ye shall be stripped and not be ashamed." . . . Needless to say the new combination is no improvement on Luke; even if, in the view of the editors, the saying about "the garment of shame" be one of the "better attested" agrapha. Applications of the teaching of Jesus to the doctrine of the Fall, especially when connected, as in Rabbinic theology, with the sexual relation, are not calculated to allay suspicion.

But to return to the "precepts." We might agree with the editors that "The purpose to which Clement (*Strom.* ii: 9.45, and v: 14.96) turns the passage from the "Gospel acc. to the Hebrews." ("He that wonders shall reign," etc.) in "support of the Platonic view that the beginning of knowledge is wonder . . . is far removed from

the real meaning of the Saying," *if* we assumed its authenticity. But neither this Saying, nor that which follows, nor those of fragment *2* give reassurance on the point of contamination. In the "Traditions of Matthias" the Saying *θαύμασον τὰ παγόντα* was expressly set down as the first step toward further knowledge. Clement compared this to the teaching of Plato in the "Theætertris." We also remain unconvinced by the assertion that "a favorable sense is much more likely than the reverse" for the verb "draw," in Saying II, "The fowls of the air, and all beasts that are under the earth, or upon the earth, and the fishes of the sea, these are they which draw you, and the kingdom of heaven is within you; and whosoever shall know himself shall find it." It is in contrast with animal life that catechumens are bidden to "know yourselves that *ye* (*ὑμεῖς* emphatic) are sons of the Father," etc., employing again, as Clement again makes clear to us (*paedag.* iii: 1; *Strom.* v: 13), the Delphic philosophy in a new application. In "Egypt" birds and beasts and creeping things could seem to Christians nothing but the embodiment of false gods. Tho the editors admit no known parallel or trace of this Saying among the other agrapha, we venture to compare the fragment of "The Gospel of Philip" (*ap.* Epiphan. *Her.* xxvi: 13), where the soul of the Christian is taught its pass-word to the heavenly regions (a counterpart to those of the Book of the Dead), "I have learned to know myself, . . . and gathered out my scattered members from all quarters, and have not sown children for the Prince (of this world), but have torn up his roots, for I am of those from above. . . . And if it (the soul) be found to have borne a son, saith he (Philip), it is detained below until it be able to take up and restore to itself its own children."

The Oxyrhynchus fragments are in a sense chips from the workshop of our evangelists. Even the adaptation of Sayings to a mystical and metaphysical sense has a parallel in the nobler adaptations of the Fourth Gospel. But it is the process rather than the material which is instructive. The Egyptian stream is a turbid one.

NEW HAVEN, CONN.

The Grand Design of Henry the Great

BY HAYNE DAVIS

[We expect to print a very notable article next week from the pen of Mr. Davis arguing for the establishment of a World's Congress—Tennyson's "Parliament of Man." In view of this article we print the following historical essay by Mr. Davis this week and ask our readers to keep it in mind when reading next week's article, for the two have a very close connection.—EDITOR.]

FRANCE was rent by dissensions between the Roman and the Reformed religions when the death of Henry III added to the trouble of these times by raising a question as to the succession to the throne. Henry of Navarre was a Protestant, a majority of the French people were Catholic, therefore when he ascended the throne as Henry IV he was confronted by as serious political work as any king ever undertook. It was practically necessary for him to create a kingdom before he could reign. Not only were Paris and other parts of France occupied by armed forces hostile to Henry, but the people throughout the kingdom were divided into factions.

Henry undertook the task ahead of him without faltering, and accomplished it in such manner that he is known as Henry the Great rather than as Henry IV. Looking about him from a secure throne at the center of a united France, he saw ambitious and menacing kingdoms on all sides. Spain, already the greatest nation, was ambitious to dominate the whole world. In view of this fact Henry came to the conclusion that he must set a limit to her aspirations in order to insure the continued welfare of France.

He conceived a plan which would accomplish not only this, but render all Europe permanently peaceful and prosperous, by forming all its nations into one Grand Republic, so that nothing thereafter should be able to shatter its foundations. It is said in the " Memoirs " of the Duke of Sully, who was Henry's Prime Minister, and the only one honored by him with the name of friend, that Henry had a feeling of shame when he first conceived this idea, and that he carried it in his mind a long time before disclosing it even to the Duke of Sully, and that when he did mention it, Sully, supposing it to be a fancy, passed it off with a mixture of pleasantry and compliment, and was very slow to recognize it as a possibility even; the king, however, required him to consider it thoroughly, and he was then converted to it as " just in its intention, possible and even practicable in all its parts, and infinitely glorious in all its effects."

Several parts of this design are of practical as well as historical interest. First, as to the territory to be included. Spain in Europe was to be reduced to the land between the Mediterranean, the ocean and the Pyrenees, but to compensate for this loss in Europe she was to be guaranteed

" Sardinia, Majorca, Minorca, and the other islands on its coast, the Canaries, the Azores and Cape Verde, with its possessions in Africa, Mexico and the American Islands which belong to it, countries which alone might suffice to found great kingdoms; finally the Philippines, Goa, the Moluccas and other possessions in Asia."

The Low Countries, which were to be taken from Spain, would have been made one nation, and Italy also was to be united before becoming a member of the union.

Other rearrangements of territory were considered necessary properly to balance as well as unite the nations of Europe, so that none need have any fear or envy of the others. Navarre and Rousillon would naturally have fallen to Henry, and it is said in the " Memoirs " that Henry decided to make it known that he would exchange them for Naples and Sicily, and make a present of these to the Pope and the Republic of Venice. Distrust being one of the great obstacles to overcome, Henry thought this would prove his disinterestedness. The " Memoirs " say that he desired nothing for France except the glory of being an instrument in the redistribution of the world with equity among the other Powers and its unification for the good of all.

The execution of this plan would have turned Europe into one Grand Republic composed of six hereditary monarchies—France, Spain, Britain, Denmark, Sweden and Lombardy; five elective monarchies—the Roman Empire, the Papacy, Poland, Hungary, Bohemia; and four republics—the Venetian, the Italian, the Swiss, the Belgic.

The Roman Emperor, the Pope, France, Spain, England, Denmark, Sweden, Lombardy, Poland and Venice were to have four representatives each, the other Powers two each, thus constituting a Senate of sixty-six persons, to be constantly in session,

" to deliberate on any affairs which might occur, to discuss the different interests, pacify the quarrels, clear up and determine all the civil, political and religious affairs of Europe, whether within itself or with its neighbors."

These Senators were to be rechosen every three years by the nation they represented.

While there was no separation of Legislative, Executive and Judicial Departments of Government, this Design was substantially in accord with the Political Reformations which have since taken place, for it contemplated the preservation of the constituent nations and their local independence, and provided for periodical choice of officers for the General Government. Organization on this Home Rule basis has been the outcome of modern political processes.

It is notable also that several parts of the Design have already been realized. Spain in Europe has not only been reduced to the boundary described in the " Memoirs," but Mexico, the Philippines and other islands to be guaranteed to her under the Design have become independent or passed to others. The Low Countries have become independent and united, and so has Italy.

When the " Memoirs " of Sully were written it would have seemed idle to prophesy that Spain could be so reduced. Where was the Power great enough to

do this? Henry thought a consolidation of Europe was necessary to accomplish it, and yet irresistible, unseen forces were operating to bring this about without the execution of the Grand Design.

Not only have these substantial parts of the Grand Design been realized, but a part of its essential feature has become an established fact. The Senate designed by Henry was to have authority, The Hague Court has none. Nevertheless, that court is the embryo of the Judicial Department of the Grand Republic.

There were many obstacles to the execution of this Design in the time of Henry IV, not the least of which was the religious discord. Several sects of Christianity had become firmly fixed in Europe, and the plan was to strengthen each wherever it had become dominant. The Roman was in possession of Italy and Spain, and adherence to it was to be exacted in both these countries. It was dominant in France, tho the Reformed was tolerated. This was to be perpetuated. Any persons not content with this were to have the privilege of departing from these countries. In other nations, Germany, for instance, religious liberty had become a principle of government, and in such states no new regulations were to be made. The head of each nation was to be a Christian prince. Any ruler in Europe not professing Christianity was to be driven out, and a Christian substituted in his place. There seems to have been a doubt about the Tzar, but he was to have choice between coming into the Union or being driven into Asia, an interesting fact inasmuch as his successor more than any other one man is responsible for the existence of The Hague Court at this time.

Some of the obstacles to the execution of this Design in the seventeenth century have been removed and others increased. The religious difficulty has been almost entirely removed, for the principle of religious liberty, then recognized in a few places, has spread to many parts of the world. And religion has found its right relation to government in the Constitution of the United States—no religion established by the general Government, and no religious test for holding office.

The dissipation of the Papal claim to temporal power has further simplified the problem. The Pope was to have as large representation in Henry's Grand Republic as any nation, and was to furnish a considerable army for forming it, if force was found necessary. The Pope has no territory now to put into the Union, and was not represented at the Conference which gave birth to The Hague Court.

Other grave obstacles to the formation of such a Republic have been removed. Time and distance, and, to a large extent, distrust have been annihilated. The most distant nations are as near together as contiguous governments then were. Opportunity to understand each other has increased and nations are beginning to see each other in the clear light of day.

Henry's method of forming such a Republic seems to be utterly inappropriate and futile now. He felt constrained to conceal his plan from two of the nations most concerned, Spain and the Roman Empire. He disclosed it fully to some, partially to others, and intended to place himself at the head of an army favorably disposed, and then issue a manifesto to all the kings and people of Europe, explaining his purpose in full, and calling on them to take part in its execution. Before doing this he was to have assurance of support from enough kingdoms to insure his success, even if Spain and the Empire refused to come in. Henry's Republic was to be founded by duress. Time has changed all this. There is now no need of secrecy in such a design, and the use of force would be fatal. When the new Republic rises it will be on the sure foundation of free consent of all nations.

In discussing the practicability of the Design it is said in the "Memoirs" that those who have overcome obstacles such as confronted Henry are best qualified to say what can and what cannot be done. And Sully is put down as believing that the assassination of Henry prevented the execution of the Design and deprived France of even greater glory than any she obtained during his wonderful reign —a glory our century is destined to achieve by creating a Congress of Nations and granting to the International Court and Congress proper jurisdiction in affairs common to all nations.

New York City.

The Procession

By RICHARD BURTON

"NOW let our womankind tend hearth and house,
Obey and love, receive, in turn, due love
Of husbands, brothers, sons, who battle for
Their wants and welfare in the outer ways,
And so fulfill the Law. This sums the whole."

Thus spake Sir Oracle. Meanwhile, meseemed
Through mists of time I saw in rich array
Pass by a white procession, one by one:

The swart-browed queen whose Eastern sovereignty
Was large, but larger yet her passionate sway
Over two men who made the Western world
Cæsar and Antony, both at her feet.
And then, bright Helen, Menelaus's wife,
And Paris's leman in a golden day;
So fair that poets e'er since have joyed to sing
Her loveliness, which claimed its hecatombs
Of victims, Greeks and Trojans battailous.
Next, Magdalen, whose penitence is famed
And precious, and the Mary men revere,
Walking in Sisterwise, with equal mien,
Save that the Mother's brow was full-content,
The Maiden's wistful. Then proud Joan of Arc,
A peasant yet a princess, with a light
Fanatic yet divine within her eyes;
A martyr's eyes that look through flames to God!
The while the lips say: "Patience, 'tis for France."
And Sappho, fillet-bound about the head,
Chanting swift lyric lays beside the sea
Ægean blue,—lays soft yet strong withal,
Since still we hear, albeit brokenly.
Hypatia, too, whose spirit was not quenched
By mob-defiance nor untimely death,
Strode gravely sweet and calm; and Portia, she
That donned a mannish habit for the nonce
And plead with angel-tongue for Mercy's place
Along with formal justice. Shyly there
Came Sister Dorothea, half a Saint
Yet all a woman, binding wounds and sores;
Her passing was a breath from the command:
"Unto the least of these my brethren."

These, yea, and many more filed by, until
The mist grew mythic and they faded out
Into the common light of day: anon,
Again I heard the little, piping voice
Make deposition as to woman's worth.

BOSTON, MASS.

Literature

Roosevelt Literature

SINCE the Presidential campaign this year is chiefly concerned with the personality of one man, it is fortunate that the man is more thoroughly known to the people of this and other countries than any other American. When the familiar challenge of "What's the matter with Roosevelt?" is heard people will not have to ask: "Who is he?" as they did of Garfield and Bryan. Without waiting to be enlightened by the "educational literature" of the party managers, every citizen now is quite ready to reply, "He's all right," or, to point out very specifically where he is wrong. Accordingly Mr. Leupp* and Mr. Riis† could not be expected to add much, except personal anecdotes, to our knowledge of the man whom they biograph, but both have given interesting character sketches of Roosevelt from the standpoint of intimate friends.

If "a work of art is an object seen through a temperament," as it has been defined, then Mr. Riis's portrait of President Roosevelt is certainly a work of art. It contains a little more Roosevelt and a little less Riis than "The Making of An American," but not much. But whatever Mr. Riis writes is interesting, even tho—or perhaps because—he makes no distinction between biography and autobiography. Mr. Leupp's treatment of the subject is somewhat more objective, and he is not so indiscriminatingly laudatory. In its main outlines the character of Mr. Roosevelt as here drawn by his two friends is the same, and, indeed, if drawn by his enemies it would not be so very different. Men of opposite political preference would be more in agreement in their estimate of him than they would in regard to President McKinley. His energy and efficiency, his fearlessness and earnestness, his fondness for plain speaking and distaste for circumlocution and finesse, his versatility, his devotion to his friends, his democratic tastes and disregard for conventionality and precedent, are characteristics too strongly marked to be ignored by any one.

In his addresses and Presidential messages‡ Mr. Roosevelt treats a great variety of topics in the same way. He has, in fact, but one style, which is the man himself. Senator Ingalls was condemned for saying that the Ten Commandments and the Golden Rule have no place in practical politics; President Roosevelt is criticised because he makes them too prominent. People who go to a mass meeting expecting as usual to be amused, excited and flattered, find it depressing to be lectured on their need of personal morality and the cultivation of the civic virtues. The volume in hand contains speeches, various in topic and circumstance, before labor unions and chambers of commerce, on battlefields and fair grounds, at missionary meetings and university commencements, to Mormons and Catholics, in Maine, California, Wisconsin and Nevada. His messages to the Fifty-seventh and Fifty-eighth Congresses are published in full. Besides these the volume contains the famous letters in which he defines his views on race suicide, negro officeholding, and the open shop. Altogether it gives a very complete exposition in his own words of Mr. Roosevelt's opinions and policies, and so is complementary to personal portraits above mentioned.

A complete biography of President Roosevelt would read like a biographical dictionary, for he has distinguished himself in such widely different fields of activity. In Europe it is not uncommon that the head of the government should be a literary man and a historian. Mr. Roosevelt is the first President of this type we have had, and he adds the

* THE MAN ROOSEVELT. *By Francis E. Leupp.* New York: D. Appleton & Company. $1.25.

† THEODORE ROOSEVELT THE CITIZEN. *By Jacob A. Riis.* New York: The Outlook Company. $2.00; paper, 50 cents.

‡ THEODORE ROOSEVELT. ADDRESSES AND PRESIDENTIAL MESSAGES, 1902-1904. *With an Introduction by Henry Cabot Lodge.* New York: G. P Putnam's Sons. $1.25.

unique characteristic of being also a naturalist. In the *Roosevelt Book** are gathered selections from his non-political writings, such as "The American Boy," "The Strenuous Life," "Frontier Character," "Daniel Boone," "The Battle of San Juan Hill," "Old Ephraim, the Grisly Bear," "The Bobcat" and some others. It is a collection intended especially for boys, and, since it is not partisan or even political, it is an excellent book to put in school libraries, where it will both instruct and inspire.

The Queen's Quair

MR. HEWLETT'S new novel† recalls the fact that he was one of the writers who brought the historical novel again into favor a few years ago. Since then we have been overwhelmed with cheap imitations. The greatest scenes in history have been made into literary chromos and some of the greatest characters made to pose as swashbuckler heroes. But the excellence of this story reminds us that the authors responsible for the historical fashion in fiction are real artists, and not vulgar comedy writers, whose aspiration is to adapt the splendid past to the vaudeville imagination of the "average reader." The heroine of *The Queen's Quair* is Mary Stuart, that ill-fated lass born of the Lady Lorraine to her black lord, James V., the child widow of the child King of France,—later the white witch, red lipped Queen of Scots, wife of the cad King Darnley, and lastly the haggard bride of her Red Bridegroom, Bothwell,—to say nothing of the lover executed for his presumption, nor of Signior David, murdered before her for a similar reason. On the face of it few women have left behind a more infamous record. Yet few have lived who commanded so much devotion, or, being dead appeal larger to the admiration and curiosity of mankind. And in this volume Mr. Hewlett does not attempt to excuse, but to explain, a character which has baffled historians and lovers for nearly five centuries:

> "A hundred books have been written, a hundred songs sung; men enough these latter days have broken their hearts for Queen Mary's. What is more to the matter is that no heart but hers was broken in time. All the world can love her now; but who loved her then? Not a man among them. A few girls went weeping; a few boys laid down their necks that she might walk free of the mire,—Alas! the mire swallowed them all up, and she must soil her pretty feet. This is the nut of the tragedy, pity is involved rather than terror. But no song ever pierced the gold of her secret, no book ever found out the truth, because none ever sought her heart,"—

And the "secret," the "truth" that accounted for her rashness, for her huntress passion for men and women, he avows, was the desire to be loved, to be cherished by her own mate, and for herself. Instead, she was the "Honey pot" around which adventurers and libertines swarmed. She gave all she had and herself with the prodigality that was ever characteristic of her temperament. And by the law of life which makes no exceptions of queens, she was rewarded with the wormwood and gall. She tasted the bitterness of death in life. A royal woman cursed with the harlot's sense of shame. It is many a day since such a character has been drawn in fiction of any kind. She had, indeed, the head of a queen, but the heart of a wench; she was not beautiful, but fine; not good, but sweet. Her only strength was a passion fierceness to win love rather than obedience. Being royal, she abased herself, and being abased, moved the world to tears over the wanton, pitiful sacrifice. Some think now that the desire to be loved is a sort of frailty, a self-confession of insufficiency; but it was the fashion in Queen Mary's day to acknowledge the primitive desire for love and admiration. Every brave man expected to become the hero of some ballad; and every fair woman demanded a lover in exchange for her fairness. This was Mary's excuse. She was a woman and famished for what women crave most. However, the story proves that she has added a true knight to her train, a love wise gentleman who has that right compassion which comprehends and pitifully interprets her poor frailty.

Besides the Queen's character, other features of the story deserve attention.

---

* THE ROOSEVELT BOOK. SELECTIONS FROM THE WRITINGS OF THEODORE ROOSEVELT. *With an Introduction by Robert Bridges.* New York: Charles Scribner's Sons. 50 cents.

† THE QUEEN'S QUAIR. *By Maurice Hewlett.* New York: The Macmillan Co. $1.50.

The author's presentation of the brawling, mist covered life of Scotland is hearty and brilliant. His vivid pictures of the naked, red legged noblemen of the realm on one hand and of the elegant blackleg courtiers, who flocked about the Honeypot Queen on the other, suggest many things besides her folly. Altogether the book is so instinct with the adventurous blood life of a past age that the prosaic modern reader is made to feel his own romantic limitations.

A New Translation of Tolstoy

When Tolstoy reviews the translations, or mutilations, to be more exact, of his many volumes of writings his spleen must be moved as was that of Charles Lamb, who abhorred things in books' clothing perched upon shelves like false saints, the usurpers of true shrines. In no one country, least of all Russia, can the careful reader get a perfect collection of Tolstoy's works. To do this he must become familiar with the Moscow, Geneva and English editions. In the first are the writings allowed in Russia; the second represents some two-thirds of the prohibited creations; the third is small and made up of later efforts. The literary output of the great Russian has been imperfectly translated into a half dozen languages, and some countries, such as France, England and the United States have as many as four interpretations of one work, all different and all equally unrecognizable to the author. The Maude translation* has Tolstoy's authorization, and he has assisted the translators where it was necessary with information and explanation. With this volume they begin a reliable English edition of Tolstoy, hoping to reach many readers, who can only afford cheap books, by reproducing this translation at a low price for the purpose of disseminating Tolstoyan views. Sevastopol relates the author's own experiences, sensations and reflections during the most noted siege of modern times. The new edition has revelation even to old Tolstoyans. "I selected certain passages from Sevastopol," says Mr. Maude, "which had a spurious ring and wrote to Tolstoy about them. His reply was: 'With reference to the translation of Sevastopol, all the extracts you sent were either altered or inserted by the editor to meet the wishes of the censor, and it would therefore be better to omit them.'" The chief passages referred to were these from the last pages of Sevastopol in December:

> "But here it seems to you that on each face peril, animosity and the privations of war have added to these dominant characteristics traces of a sense of personal dignity and of higher thought and feeling."
>
> . . . . . .
>
> "And this power is a feeling which the Russian people rarely show, and are even ashamed of showing, but which lies deep in every heart—the love of their native land."
>
> "It is a comfort to think that it was not we who began this war, that we are only defending our own country, our own Fatherland."

The famous passage in "May, 1855," in the Tolstoyan version, is thus rendered:

> "Yes, white flags are on the bastions and on the parallels; the flowery valley is covered with dead bodies; the beautiful sun is sinking toward the blue sea; and the undulating blue sea glitters in the golden rays of the sun. Thousands of people crowd together, look at, speak to, and smile at one another. And these people—Christians confessing the one great law of love and self-sacrifice—looking at what they have done, do not at once fall repentant on their knees before Him who has given them life and laid in the soul of each a fear of death and a love of good and of beauty, and do not embrace like brothers with tears of joy and happiness.
>
> "The white flags are lowered, again the engines of death and suffering are sounding, again innocent blood flows, and the air is filled with moans and curses."

Tho bereft of some tinselled ornamentation given in the French version it has a stronger, simpler and truer ring. One can understand why Tolstoy desired its true interpretation in all tongues when he realizes that this noble and beautiful sentiment written by a young man of twenty-seven remains to-day the kernel of his belief. Remarkable for its evidence of genius, it proves furthermore the lifelong consistency of Toystoy's view, so often questioned by the unknowing. The man who penned this passage had in germ "Resurrection" and all his later doctrines of peace and brotherly love.

* SEVASTOPOL, AND OTHER MILITARY TALES. *By Leo Tolstoy. Translated by Louise and Aylmer Maude.* New York: Funk & Wagnalls Co. $1.50.

The Memoirs of Henry Villard. Two vols. Boston: Houghton, Mifflin & Co. $5.00 net.

The late Henry Villard, journalist and financier, came to the United States as a penniless German lad in the year 1853. The story of his life as here given is somewhat of a patchwork in character, as he did not live to complete or revise it himself. It contains, in the first place, his own narrative of his early vicissitudes, and of his work as a newspaper correspondent up to the year 1863; then his somewhat elaborate studies of the battles of Chickamauga and Chattanooga; and, finally, a brief narrative, in the third person, of his career as a financier since the war and up to the time of his death, four years ago. During this period Mr. Villard carried to completion the Northern Pacific Railway, and became the owner of the New York *Evening Post* and *Nation,* which he combined. The character of the two volumes makes it necessary to criticise it from two points of view. The historic narratives, which occupy nearly all of the second volume, are careful studies which will prove of value to the investigator, but they would not interest the same readers to whom the first volume would appeal. The latter is a very interesting account of the experiences of a newspaper correspondent just before the war and during the first two years of it. The autobiography is lacking in personality, but it is a very well written account by a trustworthy writer of persons and events concerning which our records cannot be too full. By far the most picturesque portions of the book are those which describe Mr. Villard's meetings with Lincoln before his election and just afterward. We have seen no more interesting reminiscences of Lincoln since the publication of L. E. Chittenden's "Recollections," many years ago. They give curious glimpses of the uncouth backwoods lawyer, whom the fortunes of the time had brought forward, as also of the manners of his wife. Mr. Villard has also gathered some facts which enable him to throw light upon the much mooted point of Lincoln's religious beliefs. The evidence in the matter varies all the way from that of Samon and Herndon, who make him an "infidel" of the Tom Paine School, to that of General Rusling, who narrates that to him and General Sickles Lincoln declared that he had no fear concerning the issue of Gettysburg, because he had prayed for victory. Mr. Villard has also interesting pictures to give of nearly all the important men of the time. He was present at the fighting of Bull Run, Shiloh, Fredericksburg and Charleston Harbor.

The Story of the Organ. By C. F. Abdy Williams, M.A., Mus. Bac. London: Walter Scott Publishing Co. Imported by Charles Scribner's Sons, New York. $1.25.

This, the latest issue in "The Music Story Series," gives a popular and interesting account of the development of "that wonderful outcome of human ingenuity and skill known as the organ" from the mechanically blown trumpet of Ctesibius of Alexandria (about 250 B. C.) to the modern instrument with all its devices and appliances. The account is based on documentary evidence and the author has gathered a surprising amount of information about organs, the builders thereof and the players thereon. He has handled his wealth of material not only intelligently, but entertainingly as well. The book makes good reading for one at all interested in any phase of the great subject of musical history. There are descriptions of many curiosities of organ building and some good anecdotes of famous musicians. A short final chapter on the method of playing the organ contains wholesome advice for the young organist, ending:

"Obtain as wide a knowledge of music as you possibly can outside the range of your special instrument, and if, in addition to this, you can find time to read great poetry and literature, it will help you in becoming a worthy exponent of the vast and many-sided powers of the king of instruments."

The Golden Chain. By Gwendolen Overton. New York: The Macmillan Co. 50 cents.

A pretty story of the far Southwest, spiced with Spanish phrases and characters. Bits of description of cañon and mesa, the frontier town of Tierra Blanca and the Valle del Muerta are distinctly good. Mexicans, cowboys and wandering actors are drawn at first hand. Miss Overton's knowledge of frontier military posts has stood her in good stead, and the critic will find

few errors in fact or atmosphere of the arid region.

Transitional Eras in Thought, with Special Reference to the Present Age. By A. C. Armstrong, Ph.D. New York: The MacMillan Co. $2.00.

A study of the present tendencies of thought in philosophy and theology in the present "age of doubt and transition," and a comparison with similar eras in the history of opinion, especially the age of the Sophists in Greece, and the period of the *Aufklärung* in the later eighteenth century in France. The rise of the "faith philosophy," as represented in William James's "Will to Believe," is interpreted as a token that the agnostic movement has passed its time of culmination, and that the close of the transitional era has been reached, and suggestions are offered for the new constructional age. The discussion is able and thoughtful, but the style of writing is more technical than the subject demands.

The Trees of North America. The Shrubs of Northeastern America. By Charles S. Newhall. Illustrations from original drawings. Two volumes in one. 8vo, pp. 250, 249. G. P. Putnam's Sons. $1.75.

This work was published in two volumes a dozen years ago, and the original paging is retained, and the thinner paper brings the book to a moderate thickness. Pretty nearly every page has an outline drawing of branch, leaf or flower, from which the species can be determined readily; and a sufficient and accurate description is given. There is nothing better to commend to the student who wishes to identify our trees and shrubs, and the price is reasonable.

The Ingoldsby Country. By Charles G. Harper London: A. & C. Black. $2.00.

Highways and Byways in Sussex. By E. V. Lucas. Illustrated by Frederick L. Griggs. London: Macmillan & Co. $2.00.

The "Ingoldsby Legends," begun in 1837, in Bentley's Miscellany, by Richard Harris Barham, are still regarded in England as specimens of classic humor. If they never attained to the same favor in this country, it is not because their humor is deficient, but because of the local coloring which characterizes them. Even here "The Jackdaw of Rheims" is thoroughly enjoyed, but its theme is a more universal one than that of many of the legends. An English admirer of "Ingoldsby," as Barham called himself, has made a pilgrimage through the country of which the humorist was a native and in which he located most of his legends. Altho the district is by no means one of beauty for the tourist, being mainly a long, dead level of marsh land, the literary pilgrim will find much of interest in visiting it, from Canterbury, or Dover, or Folkestone, and even if he cannot do this he will enjoy the book, for it is pleasantly and enthusiastically written. Another volume of local topography and history is *The Highways and Byways of Sussex,* one of the most interesting counties of England, full of historical associations from the time of the Romans to modern days. The author has gone through its length and breadth in various ways, on foot, on bicycle, by rail, and has collected and related in a thoroughly genial manner a vast amount of interesting matter. The book can be recommended as a vade-mecum to any cyclist who wishes to see English rural life amid historic surroundings; and the county can be easily entered either from Southampton or by the railroad from London to Brighton.

The Woman Wins. By Robert Barr. New York: Frederick Stokes & Co. $1.50.

This is a volume of short stories, in which all the heroes are cads or cheap villains, while the heroines vary accordingly, from a countess to a pretty telegraph operator. Mr. Barr gives the impression of having selected his characters at a bargain counter, and not to have paid too well for them in literary expression. The book abounds in "shuddering cries," "great silences," betrothals, broken hearts and "dramatic hilltops."

In the Dwellings of the Wilderness. By C. Bryson Taylor. New York: Henry Holt & Co. $1.25.

A short story with a new kind of thrill, tho obtained by means of the old properties of Egyptian tombs, the desert and a mummy. We have always thought that Mark Twain's inquiry, "Is he dead?"

when shown a mummy, indicated a lack of intelligence on his part, but if half the things told in this book are true, it was a very wise and cautious question. We warn all who have nerves and nightmares against reading this book.

Slav or Saxon. A Study of the Growth and Tendencies of Russian Civilization. By W. D. Foulke. Third Edition. New York: G. P. Putnam's Sons. $1.00.

This very readable account of Russian expansion was first published in 1887 and has probably had a good deal to do with the growth of Russo-phobic sentiment in the United States. It is now brought up to date by the addition of chapters on the way in which Russia treats the Jews, the Finns, the Armenians and the Chinese. Notwithstanding its bias and its rhetorical generalization, it deserves its popularity, for it gives in a brief and graphic way a description of Russian institutions and a history of the expansion of the empire.

Literary Notes

BLAIR AND ROBERTSON'S valuable reprint of original books and manuscripts bearing on the Philippine Islands, published by A. H. Clark Company, Cleveland, has reached the fourteenth volume and the period 1603-1609. We shall publish another review of the work in a short time.

....The Packers' Association, of San Francisco, has published Prof. George Davidson's report on the Alaska Boundary, which contains detailed maps of the disputed *lisière,* the texts of the treaties and conventions concerning Alaska, and a thorough discussion of the Russian, British and Canadian maps and their bearing on the question. Since the tribunal of arbitration has rendered its decision the argumentary portion of the book loses somewhat of its interest; but as a contribution to history and geography it is well worth publishing.

...."The Canvasback Library of Popular Fiction" consists of reprints of the novels which were popular day before yesterday, but are just as interesting now as they ever were. They are comfortably bound in boards and canvas, and cost 75 cents (John Lane, New York). The first of the series is "Madamoiselle Blanche," by John B. Barry, a genuine French novel. We do not use the words in their objectionable sense, but a romance of such lucidity, directness and simplicity of style and plot is very rarely written outside of France.

Pebbles

DON'T make it worse for a married man by referring to him as a Benedict.—*Atchison Globe.*

THEODORE ROOSEVELT.

ALERT as bird or early worm,
Yet gifted with those courtly ways
Which connoisseurs correctly term
The *"tout-c'-qu'il-y-a de Louis Seize;"*
He reigns, by popular assent,
The People's peerless President!

Behold him! Squarely built and small,
With hands that would resemble Liszt's,
Did they not forcibly recall
The contour of Fitzsimmons's fists;
Beneath whose velvet gloves you feel
The politician's grip of steel.

Accomplished as a King should be,
And autocratic as a Czar,
To him all classes bow the knee,
In spotless Washington afar;
And while his jealous rivals scoff,
He wears the smile-that-won't-come-off.

And since his sole delight and pride
Are exercise and open air,
His spirit chafes at being tied
All day to an official chair,
The bell-boys (in the room beneath)
Can hear him gnash his serried teeth.

In summer time he can't resist
A country gallop on his cob,
So, like a thorough altruist,
He lets another do his job;
In winter he will work all day,
But when the sun shines he makes Hay.

At 6 a. m. he shoots a bear,
At 8 he schools a restive horse,
From 10 to 4 he takes the air—
(He doesn't take it all, of course.)
And then at 5 o'clock, maybe,
Some colored man drops in to tea.

In martial exploits he delights,
And has no fear of War's alarms;
The hero of a hundred fights,
Since first he was a child (in arms):
Like battle horse, when bugles bray,
He champs his bit and tries to neigh.

And spite of jeers that foes have hurled,
No problems can his soul perplex;
He lectures women of the world
Upon the duties of their sex,
And with unfailing courage thrusts
His spoke within the wheels of Trusts.

A lion is his crest, you know,
Columbia stooping to caress it,
With *vi et armis* writ below,
Nemo impune me lacessit;
His motto, as you've read already,
Semper paratus—always Teddy!

—*The Metropolitan Magazine.*

Editorials

The Independent Bound

DID you ever notice how hard it is to get information about an event which happened more than three months and less than three years ago? The latest books do not have it in, and the papers and magazines are usually destroyed as soon as read. You have a recollection of having seen just the article you now need in a recent magazine, but since you cannot get it it is merely an aggravating tantalization.

It may be that the Program Committee of your Current Events Club has called upon you suddenly—they always do call suddenly—for a paper about the Cripple Creek situation, when the dynamite exploded under the railroad station. Then you wished you had preserved that number of THE INDEPENDENT which contained such a complete account of the labor difficulty there. Or if you had known that the Governor General of Finland was going to be shot you would have preserved those articles by prominent Finns on the causes leading to their expulsion. But you did not know that these things were going to happen. You never do. And unless you are in the habit of preserving a file of some magazine you will not have what you want when you want it. A well indexed periodical is better than the best memory.

A magazine is a magazine; it is a storehouse of intellectual ammunition, and it must be kept stored. There are undoubtedly some articles in the present issue which do not interest you, because you do not need them—now, but there are very few which you will not need some time in the next few years. You cannot cut the important articles now for your scrap-book, because you do not know what articles are the most important for you. In science, now, the most important matter is published in periodicals, and the same is coming to be true in literature.

This is not an advertisement. The advertisement is on another page. It is an editorial of general application. But its specific purpose is to remind you that the half-year closes with this issue, and that if you have followed the advice we gave you last January you can return to us the numbers for the past six months and secure a bound volume, which will be as much used as any in your library by the whole family and as often borrowed by the neighbors.

The Republican Ticket and Platform

MR. ROOSEVELT was nominated by acclamation at Chicago because he had made himself so clearly the leader of his party and the first of Republicans. The solemn promise that he would carry out the policies of Mr. McKinley he has faithfully kept, but at the same time he has established policies of his own and exhibited qualities that have commended him to his party as eminently fitted for leadership. His honesty, vigor, courage, patriotism and sincerity, his love of justice, his hatred of corruption and fraud—these are known to all. A large part of the Republican platform is the President himself and the acts of his administration. Of the written platform reported by the Committee on Resolutions and adopted by the convention we shall speak hereafter. The candidate for Vice-President was selected with good judgment. Mr. Fairbanks has had an honorable career and is well-equipped for the office. Considered from the point of view of political expediency, the nomination was wisely made. Possibly the vigorous and picturesque personality of Mr. Cannon would have excited more partisan enthusiasm. But he would not go on the ticket, and as it stands it is a very strong one. Admiration of Mr. Roosevelt will draw some young Democrats to the support of it. On the other hand, if the Democratic party should nominate a conservative candidate like Judge Parker or Judge Gray, upon a platform in accord with his views and tendencies, some who have long been

known as Republicans would vote for it. But there would be not many of these. Democrats who left their party when Mr. Bryan was nominated, however, would eagerly grasp the opportunity to return.

Smoothness is the leading characteristic of the new Republican platform. Sharp, aggressive and angular declarations upon the foremost issues of the time are avoided. There is an abundance of partisan history, much pointing to the record, but little definite promise as to the future. And we are bound to say that the record, even when shorn of partisan exaggeration and misrepresentation, is a remarkable one. It has its place and is justly a source of political strength; but the future should not be avoided. "We insist," says the platform, "upon the maintenance of the principles of protection, and, therefore, the rates of duty should be readjusted only when conditions have so changed that the public interest demands their alteration." Here there is no promise of tariff revision, no statement that the present rates are or are not what they ought to be, no promise even of an official inquiry (by such a Commission as Mr. Roosevelt has suggested, or by any other agency) to ascertain whether readjustment is now required by changed conditions. Nor is there any defense against the assertion made even by Republicans that duties no longer needed for reasonable protection are abused by Trust combinations to the injury of the consuming public. The truth is that the convention was controlled by those who oppose revision, and that the party in the approaching campaign will stand solidly against such tariff reform as is continually suggested by the exactions, in the home market, of protected combinations that sell their products abroad at low prices. We believe that this platform utterance was a blunder and will be a source of weakness in the campaign. The party ought at least to have promised an investigation, to be followed by such action as the conditions might require.

The platform's utterance concerning reciprocity is simply a bar against reciprocal agreements, if it be assumed, as it doubtless is assumed by the platform-makers, that no existing tariff duty can be reduced, by reciprocal treaty, "without injury to American agriculture, American labor, or *any* American industry." The party has gone backward from the position of Mr. McKinley, who was regarded as a stiff protectionist. Its committee declined at Chicago to place in the platform those memorable words of his last speech suggesting the use in reciprocal agreements of "some of our tariffs, if, perchance, they are no longer needed to encourage and protect our industries." It has as little respect for that suggestion as it has for the reciprocal treaties which he caused to be negotiated, and which are covered with dust in the pigeon-holes of a Senate committee room.

"Fortunately," says a prominent Republican journal, "those who opposed any recognition of reciprocity were defeated. To repudiate what the party distinctly proclaimed both in 1896 and in 1900, and what McKinley left as his dying legacy, would have been a colossal blunder which would have returned to plague the party." But this is what the platform does repudiate, and the committee well understood what it was doing.

Trusts and labor unions are considered in one brief paragraph, the gist of which is that neither must be permitted to "break the laws" or to "infringe upon the rights and interests of the people." Good, so far as it goes, but there is not quite enough of it to satisfy many worthy persons whose votes are worth having. There are other references to Trusts, it is true, in the historical parts of the platform, but we find no repetition of that passage in the platform of 1900 which "condemned all conspiracies and combinations intended to restrict business, to create monopolies, to limit production, or to control prices." We do not desire to belittle the enforcement of the Anti-Trust law in the great railroad case, but it must not be forgotten that Trust combinations of manufacturers have not yet been touched, and that a Republican Senate ignored the bill by which Attorney-General Knox expected to reach them. No promise is made in this platform that the party will attempt to restrain the manufacturing combinations by a revision of the tariff or by legislation that would bring them within the scope of the Anti-Trust laws. Here, we think, an opportunity to commend the party to independent voters was lost.

We are glad that the party distinctly favors an inquiry as to the suppression of negro suffrage in the South, and that it demands a proportional reduction of representation in Congress and the Electoral College if it shall be proved that the elective franchise in any State has been unconstitutionally limited. Such a reduction would be nothing but common justice, and no honorable Southern man should object to it. The attitude of the party toward arbitration, the civil service laws, the policy of the President and Secretary Hay in the Orient, the navy and the gold standard is to be commended. The Smoot inquiry might well have suggested a few words in disapproval of polygamy. All who long for Republican success at the polls should regret the impolitic, if not unjust, exclusion of the La Follette Wisconsin, delegation. The election of Mr. Cortelyou to the chairmanship of the National Committee places the management of the campaign in the hands of an honorable man, who enjoys the respect and confidence of the head of the ticket. It remains to be seen how formidable the Opposition will be. Against a united Democracy supporting a conservative candidate upon a reasonable platform the Republican party may feel the need of more definite utterances and promises upon what appear to be the leading issues of the day.

Eugenics

We have a few words to say by way of comment on the article in this issue, in which "A Bachelor Maid" tells why she does not marry. By way of confession and avoidance we admit that what we say of approval or stricture comes from the pen of one of the unworthy male "assortment," so that its judgments may be taken with due reserve.

And first, we agree that she has done well not to marry. If a woman does not care to marry, and is not drawn to any man by her affections reinforced by her best judgment, she ought not to marry.

And next, we agree that the bachelor maid who has an ambition to serve the world as teacher or in any other useful way which fully occupies her time and heart, probably does as useful a service as most of those who marry and rear families. We have no doubt as to our correspondent.

And further, our correspondent is absolutely and totally right in her claim that in marriage it is the wife's part quite as much as the husband's, and more, to say how many children they shall have. That is a matter in which health and other things are to be considered, and as to which the woman's judgment should usually have controlling weight.

And yet again, our correspondent is absolutely and eternally right in her claim that the man has no inherent authority over the woman to overrule and suppress her equal right of judgment and decision. Intelligent and right-minded clergymen no longer require the bride to promise to "obey" her husband, and where the form is accepted the promise is mutually understood not to be binding. Our correspondent has been unfortunate in her wooers.

And further, no decent husband would fail to take pride in any development of intelligence or general service on the part of his wife that she can conscientiously carry on. We have not observed, in fact, that as a rule bachelor wives are much inferior to bachelor maids in attainments and usefulness.

Now for the other side of the question of eugenics, Sir Francis Galton's word, and a more agreeable word than the older and coarse word, *stirpiculture,* for Greek has a gentler sound than Latin. Even euthanasia in its Greek dress sounds almost commendable. It is beyond all doubt in the order of nature, and it is well, that such women as feel the gift for it should marry and have children. Human beings are the crown of creation. There must be children to succeed parents, or all the world is good for would perish. Were other women unfortunately like our "Bachelor Maid," land and water would go back to the rule of Zeuglodonts and Titanotheres, when

> "A monstrous eft was of old the lord and master of earth;
> For him did his high sun flame, and his river billowing ran,
> And he felt himself in his force to be Nature's crowning race."

Do we want the world to go back to the war of Cervidæ and Felidæ? Would

it not be a horrible conclusion of all Earth's worthy history? But that would be the sure alternative if maids and youths should refuse to wed. It must be that duty has some place here as well as instinct.

Again, our correspondent is worlds away from right in looking upon the parental creative process which produces and nourishes children, that by which we approach nearest to the creative work of God, as something too "unromantic," "revolting," and even "disgusting," to be patiently considered by a pure mind; for so she speaks of the desire of her lovers for "a mother for their children."

It is true that married life is not all strawberries and cream. Nor is any other strenuous life. Children are born with pangs, and their care involves much disagreeable service. But they are worth it. They are God's best gift and humanity's chiefest wealth. These pangs and toils are woman's share, and we cannot change it if we would. Men also have their toils and pains, and if women go insane and die from too much of their burden, so do quite as many men from their's. If women's task for their children is revolting or disgusting, so is that of men who must breed the lesser value of cattle, fertilize the ground with the refuse of stables and pig-pens, and be body servant to cows, horses and swine. But the wealth of the farm is well worth raising, and vastly more so the wealth of the cradle. We shut our eyes and close our nostrils to the disgusting, and we wisely clothe with all the glamour of poetry the rich peacefulness of rural independence. And so it is the wiser vision which forgets the pangs of maternity for joy that a man-child or a woman-child is born into the world, and takes dearer delight in caring for one's own infant than in any other pleasure which life offers.

So we hold that those men and those women who choose fit mates, who have the gift of love and sacrifice for each other and for their children, choose what is usually the worthier and the harder and the happier life. They suffer more, they gain more, they lose more, they retain more. Death strikes them nearer; heavier burdens are usually their's, but richer rewards. They marry expecting children, as they should expect. The more children the more wealth, within the bounds of reason. Children, well trained by such parents as those for whom we write, are the crown of honor and the defense of their parents in old age, and children's children will call them blessed. It is marriage that gives dignity and independence to the youth and maid; it is the family that is the unit and stability of the State; it is the children of worthy parents that must receive, maintain and advance the world's civilization. While we honor the useful service for a few years, or many years, of the bachelor maid, who prefers to teach or write, we regret that she could not find the "right man," who would sympathize with and aid her ambitions, while she should be at the same time the proud mother of children.

Commencement Advice

ONLY in the smaller college does commencement oratory of the old school survive. That oratory, paradoxical as the statement sounds, was an art practiced by young men and not by their elders. It is old-school oratory now, because, like a certain type of good manners, it has nearly vanished.

The cultivation and display of that old-time art was a simple matter. From the day he entered college until the dawning of commencement morning at the end of his Senior year, every student knew that he was chosen of destiny to stand before an expectant throng of trustees and professors, famous alumni, serious-minded fathers and mothers, fluttering sisters and sweethearts, and, in rounded periods, to reveal to them, and through them to the world, some great message of philosophical truth or political wisdom that had unaccountably been withheld from the human mind until that hour. In preparation for the crowning event every student practiced "oratory" and participated in prize contests throughout his four years' course.

From the commencement stage of the larger college the inspired band of youthful orators has gone forever. A wordly and impatient age ceased to value graduation eloquence at the old-time appraisal, and began to clamor for a livelier performance. So now we have pro-

cessionals and many down-sittings and up-raisings therewith, and instead of the inspired language of youth we have by way of eloquence an "address," "worthy" of such an "occasion," impressively delivered by a "distinguished mind" or an "eminent publicist."

It is not to be denied that the "distinguished mind" is sometimes clear-headed, and that the "eminent publicist" now and again reveals traces of gray matter. There are commencement addresses in print that pertain to literature and to public law. George William Curtis, for example, had a way of saying things in commencement addresses that were not borne into oblivion on the wings of the summer winds. But the Curtises and the Lowells are no more. The commencement speakers of to-day too often give utterance to "views" that rightly perish with the head lines of yellow journals.

Whatever the theme upon which the graduating senior gave forth wisdom, he rarely failed to strike the chord of hope. Looking out upon life with the eyes of youth he saw how to remedy every social and moral ill. The "distinguished mind" and the "eminent publicist" have been disillusioned. They come before their youthful audiences with warnings and advice. They have learned how different the big world of politics and business is from the little world of the college class room. They have made the important discovery—which they somehow missed in their student days—that books and theories are "academic," and that in a practical age scholarship and idealism are regarded by self-made men as just a bit ornamental or visionary.

The President of Cornell University is a "distinguished mind." Years ago he wrote a book on "The Ethical Import of Darwinism," in which he arrived at the conclusion "that the morality of the family is varied and changeable." After "ransacking the past" and "forecasting the future" he found himself of the opinion that "a change is actually going on in the form of our own system of conjugal relations, the significance of which seems altogether to have escaped attention." "The virtue, soul and essence of the whole business is the existence among us of a family ethics admitting casual unions and separations of the sexes with the same facility and frequency, and with as little loss of respectability, as is wont to obtain among savages and barbarians."

The essay was a doctorate dissertation, and, of course, was "academic." President Schurman has seen a good deal of life since his student days, and now, in his commencement advice to the Cornell boys and girls, he tells them that every young man "should look forward to providing for a wife and family," and that he has "no patience with college graduates who deliberately elect bachelorhood."

This view suggests the same question as one of our contributed articles in this number. If our college graduates of to-day are less inclined to marry and to rear families than their fathers were, is the cause of their disinclination in any way connected with present educational tendencies? Does modern education inhibit natural instincts and enthusiasms? Is the whole story of a radical change in the spirit of education after all told in this substitution of pessimistic commencement advice for spontaneous graduate oratory? Did the old order express a certain popular confidence in the young man, which gave him confidence in himself? Does the new order teach him that too much self-confidence is "bad form"?

The proprietor of the New York *Tribune* is an "eminent publicist," "which nobody can deny." He has been our Ambassador to France, and a member of the Commission that fixed the terms of peace with Spain. In his advice to the graduating class of the College of the City of New York he remarked that many of the people coming to this country from older lands are "entirely unfamiliar with the duties and responsibility of free government, and cannot distinguish between liberty and license. If they are to become useful members of the body politic it must be through the great common school system, of which the City College is the crown."

Most of those who heard this utterance regarded it, we fear, as platitudinous. But it was not. A platitude is a commonplace truth, and these statements are by no means true. Very few, if any, of our immigrants come to our shores ignorant of the distinction between liberty and license. They convert liberty into license after a thorough-going schooling in "how to do it" by our ward politicians, city officials and magistrate's

courts. If they are to be converted into useful members of the body politic they must have, besides the common school instruction that sharpens their wits, a discipline of life under just industrial conditions and a clean adminstration of equitable laws.

On the whole we confess our skepticism upon the value of pessimistic and ill-considered advice, bestowed from above upon graduating youth, as a substitute for the spontaneous and hopeful oratory of self-confident youth itself.

Our Annual Tetanus Epidemic

We called attention last year and the year before to the annual epidemic of tetanus which takes place in this country every year just before and after the Fourth of July. Last year in connection with the celebration of the glorious Fourth in this country 406 deaths from tetanus occurred. These were not the only deaths due to the use of fireworks, for some 60 persons perished as the result of severe injuries. Of serious non-fatal injuries over 1,000 were reported; of minor injuries altogether there were nearly 2,000 of sufficient importance to get them into police or dispensary reports. The *Journal of the American Medical Association,* which is the official representative of the regular profession in this country, calls renewed attention to these statistics and discusses the possibility of making the annual holocaust somewhat less during the present year.

The greatest danger around the Fourth of July consists in the development of tetanus as the result of wounds inflicted by various forms of fireworks. The tetanus bacillus exists commonly in street dirt and is likely to be on the hands of those who are playing or working in the street. Ordinarily the bacillus does not grow readily when freely in contact with the air. If it becomes buried in the tissues, however, out of contact with the air, then it grows very luxuriantly. Injuries inflicted by fireworks are likely to carry street dirt from the hands deep into the tissues. Often the wounds themselves heal very kindly. After from five to ten days, however, symptoms of tetanus develop and then there is very little hope for the patient. Last year, of all the injuries inflicted by fireworks in which tetanus developed, only seven cases were reported as having recovered. As recoveries in tetanus, then, are rare events and are consequently almost sure to be reported, these statistics can be accepted as final, and it may be considered that 95 per cent. of the cases will end fatally.

Of the cases in which the cause of the wound from which the tetanus developed was known 363 were due to blank cartridges. It is evident, then, that this class of wound particularly must be taken special care of in order, if possible, to avoid the occurrence of tetanus. The reason for special liability to infection in these cases is not far to seek. Usually it happens that a portion of the pasteboard wad of the blank cartridge is shot deep into the hand or finger, often carrying with it a disk of the tough palmar skin, and this accident usually occurs in a person whose hands have become thoroughly soiled with street dirt in the process of vigorously celebrating the Fourth. Not infrequently the wound has been inflicted with a pistol close to the tissues. As a consequence they are burned and seared, thus burying the tetanus bacillus out of reach of the air, where it is almost sure to grow abundantly. It is not realized often how deeply penetrating such wounds are. Occasionally portions of pasteboard wad pass through between the bones of the hands to just underneath the skin at the back, tho without penetrating.

The safety of the patient then demands that every part in which dirt from the surface can possibly have been blown be thoroughly cleaned out and then so packed that air can enter and the wound secretions escape. As a rule this requires anesthesia and careful, prolonged dissection and treatment. Very few patients will submit to this, and when the injured are children very few parents care to give permission for what is, after all, quite a surgical operation. Such wounds look rather innocent, and it seems hard to imagine that anything serious can come from them. How much good may be accomplished by thorough methods, however, may be appreciated from the fact that in a series of ten cases treated in Cleveland last July by such measures no tetanus developed, whereas five cases treated superficially outside the hospital

afterward came into the hospital to die of tetanus. The cauterization of the wound as is practiced by some is likely to do more harm than good by actually burying the tetanus bacillus effectually out of contact with the air.

Where deep injuries have been inflicted by fireworks when the hands were dirty and there is manifest danger of tetanus then all the best authorities are agreed that the injection of tetanus antitoxin is a very helpful measure. This neutralizes the toxins of the bacillus and gives nature a chance to overcome the harmful effects before they become absolutely paralyzant to the nervous system. No bad result has ever been known to follow the injection of tetanus antitoxin, tho it has been employed now in many hundreds of thousands of cases. It should in bad cases be injected for several successive days in the neighborhood of the wound and will add greatly to the assurance of the safety of the patient.

If parents do not want to subject their injured boys to such severe surgical procedures, then they should prevent them from using certain classes of fireworks. Besides the toy pistol—that is, the one which shoots blank cartridges—the most dangerous form of fireworks as regards tetanus is the cannon cracker. When this latter explodes in or near the hand a state of affairs results resembling very much those which follow injury by the blank cartridge, and all the precautions advisable for such wounds are in order. Injuries and burns from display fireworks, such as Roman candles and rockets, cause very few tetanus infections, and, so far as could be ascertained by careful investigation by the *Journal of the American Medical Association,* last year, there were no tetanus infections after injuries due to paper caps, torpedoes and small firecrackers.

To diminish greatly the mortality of fireworks at this time it will not be necessary, then, absolutely to abolish the present foolish method of celebrating the Fourth, tho this might be an eminently desirable consummation from other standpoints as well as the fear of tetanus, but only to limit the use of fireworks to those which are less dangerous, and to be ready to encourage and approve the most thorough treatment of fireworks injuries. Even with all this, however, it is sad to contemplate how many young lives will be the victims of a national weakness and how many vigorous, usually healthy children will be sacrificed to the folly so characteristic of our people of letting things go just because they have always gone so. We shall have something like the " Slocum " horror, but without its revulsion of feeling for good.

Camping in the City

If people do not know all about camping it is surely no fault of us magazine editors. We offer a hundred delightful regions for their selection, and all that there is to be done to reach them is the purchase of a railroad ticket, with the added possibility of a stage trip through refreshing scenery. Yet heretofore too little attention has been called to the advantages of camp life in a large city—each summer the abode of a goodly number of lightly settled individuals. Such are chiefly men temporarily deprived of their feminine attachments, who have departed elsewhere in search of whatever they may hope to find.

By this, of course, one does not mean that the city camper sets up his tent in a park or along a leafy boulevard, but that in the city he enjoys a semi-picnic kind of existence, which has attractions in some respects surpassing primitive life in the woods.

To begin with, our camper's shelter—his apartment or rooms—takes on very much the atmosphere of a tent. There is a pleasing abandon about the domicile lately vacated by madam. With the departure of her trunks for the seaside, the place ceases to be kept " picked up." It is probable that some such condition of affairs as this in mind is the reason why she has prudently secured most things ornamental as well as useful within closets or disguised beneath linen and paper wrappers. Hence there remains little for our camper but a stick or two of furniture, with the bare walls and floor of his tent.

It is then that he begins to make surprising discoveries in the science of light housekeeping. If he finds that the electric light or gas bracket is an excellent substitute for the hatrack—sent hence

for repair—what more appropriate place for wet shoes could there be than the kitchen range oven. Again, how shortly it becomes manifest that the interior of the washtub is an absurd waste of space, a very proper use for which may be found as the depository for empty soda water siphons, or anything else he may have omitted to consign to the dumb-waiter. Dust, of course, is ever with us, whether we camp in the forest or city; but a flick of the handkerchief will always remove a cloud of that entirely superfluous element from one particular spot to another. As pots and pans have such a pernicious habit of encrustation or burning holes in themselves, if he elects to prepare his own breakfast he finds that matters can be much simplified by boiling his eggs in the coffee pot. So, too, if in omitting to close the windows a thunderstorm pours a flood of water into the apartment, what matters it when the carpets and curtains have been removed?

In the matter of dress, the city camper, like he of the forest, dispenses with conventionality. But while he sallies forth in negligé garments, such have been nicely pressed for him by the tailor, instead of by his sporting dog sleeping upon them over night. If it is provender he is in search of, he brings his game down in a comfortable restaurant, cooled by electric zephyrs, and served on porcelain by swiftly attentive waiters, instead of on tinware by himself. More than this, when his supper is over he does not find himself confronted by the impossible task of attempting to wash the dishes with cold water, but he lingers over a cup of coffee, listening to the strains of music proceeding from a grotto that is refreshing to the eye and wonderfully like nature, except that it secretes overheated Teutons instead of overactive insects.

But it is in his rambles through the city that it is presently borne in upon our camper's mind that the town has changed its social color. The city has become obliging, deferential, almost obsequious. It is less hard and aggressive. For instance, if he sits on the edge of the grass in the park, just where the overhanging branches of some tree give pleasant shelter, it is more than likely he will be permitted to remain there undisturbed. If he asks the way to some unfamiliar spot, policemen have been known to go out of their's to direct his footsteps thither. He may traverse the length of an avenue on a Saturday afternoon, for all the jostling of a crowd or the danger of speeding vehicles, as if sauntering down the main street of some country village. For a whole block the pavement may be his, while at the corners cabmen touch their hats to him, tho it might seem obvious he has no intention of engaging their services.

Again, the politeness of the shopkeepers is another feature which impresses itself upon the summer camper in the city. It seems to be a real pleasure to drag forth half the stock and display it upon the counter, even tho it has been clearly stipulated that the sum total of expenditure is not to exceed two dollars and a half. But more than this, the proprietor or attendant is not above an exchange of views upon topics of the moment. One is almost inclined to believe that the production of penknife and stick for half an hour's whittle would not be regarded as a subject of inquiry into the customer's mental balance.

In church the city camper is likely to become a bone of dispute between one or two ushers as to which shall conduct him to a front seat. There, with a pew to himself, he may listen to the sermon from the identical spot where in winter time a man of goodness knows how many millions possibly reflects that there are other things in life than cornering the market.

To be sure the city camper cannot build a log fire to spin yarns about,—even a gas log would be too warm. But after all, nature is everywhere and in everything, from the sprouting of a blade of grass to the chorus of sparrows at sunrise and sunset. And above us all, wherever we may be, is there not the one tent celestial, pitched in a field that bears no trespass sign, and to dwell beneath which we are required to ask no man's permission?

Canadian Church Union

The movement for organic union between the Presbyterian, Congregational and Methodist Churches in Canada has been advanced another step by the discussion and resolutions passed at

the Presbyterian General Assembly just concluded at St. John, New Brunswick. These resolutions indorsed Church union, appointed an influential committee to report on the subject to the next general assembly, and widened the scope of the movement so as to include the Anglican and Baptist Churches. It is to be doubted, however, whether this "widening" will further the cause materially, as the Anglican Church in Canada has always regarded itself as the one proper source from which proposals of organic union should emanate, and so far those proposals have suggested the well-known union of the lamb with the lion—the lamb being inside. It is noteworthy, however, that the Methodist Church of Canada, numerically the strongest Protestant Church there, has already declared itself in favor of the movement by a resolution of its general conference; and as it is itself an example of the union of several Methodist sects, whose rivalries were not long ago as pronounced as they were expensive, much may be hoped for from the study and influence of that example. The movement has begun most auspiciously, and as the influence of the Presbyterian Church in Protestant Canada is preponderant, a successful issue may reasonably be expected. There is no disposition among the friends of Canadian Church union to minimize the opposing influences due to differences of doctrinal belief and tradition, but it is pointed out that many of those differences are no longer emphasized in the pulpit, and that a process of social and educational assimilation among the adherents of these three churches has been going on so long that union should not longer be delayed.

The Reason of a Minuscule

Here is a question occasionally asked us, which now it seems worth while to answer, as it comes from a colored man of international distinction. He says:

> There is one thing in connection with THE INDEPENDENT which I have never been able to understand, and that is, why it persistently refuses to spell "Negro" with a capital "N." For example, in your very just criticism of President Hyde's platform you use this sentence: "We know many thousands of trained Chinese, Japanese, Hindus, Indians and negroes who, under the skin, are just like Caucasians." Why you should capitalize every one of these other races except the Negro, is past my understanding.

Both the "Century" and the "Standard" Dictionaries print the word with a small *n;* but that is not our reason, for it is the duty of the dictionaries to follow our, and other, good usage, not ours to follow them. Their duty is to report what good writers and speakers say. One reason is that *negro* is not, like *Chinese, Hindu, Indian,* derived from a geographical proper name. In French even proper adjectives begin with a small letter, which is better than our English way. *Negro* comes from the Spanish word for black, and we do not capitalize the negro race any more than we do the white, yellow or red race. There is another reason: We have observed in negro journalism the idea that somehow a big N dignifies the designation, and, indeed, some seem to swell bigger with the atrocious term "Afro-American." Of two alternatives we choose the less conspicuous—except in advertisements. The low voice marks the gentle breeding.

Syrian Citizens

Meraat-Ul-Gharb, "the Mirror of the West," a semi-weekly Syrian journal published in New York, makes an impassioned appeal to the Government and people of the United States to protect naturalized American citizens of Syrian birth against the rapacity and injustice of Turkish officials. It is only a few blocks from our office to that of our exotic contemporary, and we have listened to too many tales of imprisonment and extortion from those who are nominally our fellow citizens, but whom the Sultan refuses to recognize as such, not to sympathize with their plea. There are some 50,000 Syrians now in this country, mostly engaged in Oriental commerce, and, therefore, in especial need of our protection. We hope Minister Leishman will succeed in the effort he is now making to reach the deaf ear of the Sultan.

Concerning New York's Water Supply

We have received from Mr. John I. Platt, of the Poughkeepsie *Eagle*, a letter suggested by passages in the article on "The Growth of Commercialism in Politics,"

by Mr. Bird S. Coler, formerly Comptroller of New York, which we published on June 9th. Mr. Platt asks a hearing in behalf of certain people in Dutchess County who, he says, were misrepresented by the article in question. It is not true, he asserts, that the bill mentioned by Mr. Coler, to prevent New York from going into certain territory for an additional supply of water, was "a measure in the interest of a private corporation, that will succeed or fail as a business venture by the dishonesty or honesty of future legislatures:"

"For the company referred to is that known as the 'Ramapo Company,' and the bill to which he refers is known as the 'Smith Water bill,' being a bill introduced by Hon. John T. Smith, member of Assembly from the first district of Dutchess County, which prevents the City of New York from taking water from the Matteawan and Wappinger creeks, in Dutchess County, under the provisions of the present laws. I know, of my own knowledge, that the Smith Water bill was not conceived or passed in the interest of the Ramapo Company, or any other private corporation. I cannot comprehend how Mr. Coler himself can avoid similar knowledge, not only that the Smith Water bill was not in the interest of the Ramapo Company, but that there is no possibility by which the Ramapo Company can be affected by it. I say this, because that company once had great powers, which were considered dangerous by many people in New York, Mr. Coler being a leader in that opinion; but these powers have been entirely taken away by legislation, in part, at least, suggested by him, and in the enactment of which he was very prominent. At the same time, powers of condemnation were given to the City of New York, so that since the enactment of these laws the city has the power to take from the Ramapo Company anything and everything of value which it owns, and to do so upon terms to be fixed by impartial commissioners selected and governed by the courts. The Smith Water bill was, and is, purely a defensive measure. When it came before the Legislature there was evidently a concerted attempt to create prejudice against it, and many intelligent men no doubt still believe that it was an improper bill, but its friends have only asked that it be discussed on its merits, and the result of such discussion was to increase the conviction that it was entirely right and just, until a majority of both houses of the Legislature, fully understanding it in every part, voted to make it a law, and Governor Odell, after an exhaustive hearing, signed it."

Mr. Platt expresses a desire to enter into a discussion of the merits of the bill. We have no space for that, and must decline to prolong the controversy in our pages.

This is the sarcastic way in which the *Church Standard* treats the late establishment of half a dozen monks at West Park, N. Y.:

"It appears that these half dozen gentlemen think they can serve God better by abandoning the society in which he placed them than by remaining in it. They may quite conceivably be right in that opinion, and the world as well as the gentlemen themselves may be the better of their retirement from it. These gentlemen further think that it is better to live as celibates than as married men, and they may be right in that. They are also convinced that it is better to have nothing of their own, and to be comfortably provided for by their community, than to engage in the ordinary and often sordid struggle for existence which is the lot of most men. They are further convinced that it is better for each of them to obey some one of their number than to follow his own choice, or even the dictates of his own conscience, in choosing his way of life. We make no objection to any of these beliefs. We simply observe that the men who hold and act upon them are engaged in an exceptional scheme of life which, if it were universal, would either destroy the human race or plunge it into indiscriminate vice within the space of one generation."

The statement of Earl Percy, the Under Foreign Secretary in the House of Commons, that the Anglo-Chinese convention of 1898 provided that Great Britain's lease of Wei-Hai-Wei should only be valid so long as Port Arthur was occupied by Russia, reveals a peculiar complication not previously realized by the public. If her ally, Japan, succeeds in capturing Port Arthur, Great Britain will be expected to evacuate the port she secured to balance the concessions of Chinese territory secured by Germany and Russia as a price of their action in compelling the Japanese to abandon Manchuria and Korea in 1895.

We venture to remind Governor Odell that Mr. Cortelyou, upon becoming chairman of his party's campaign committee, exhibited his sense of propriety by promptly resigning his public office.

New Mississippi Form

THE Continental Insurance Company issues the following circular to its Mississippi agents:

"We are sending you, under separate cover, copy of a new household furniture form which we have found it necessary to adopt, in view of the recently enacted amendment to your law which makes valued policy conditions apply to household and kitchen furniture. Unless we are able to get this class of property under the specific form which we have adopted, we shall have to request you to decline it altogether for this company."

An interesting item forming a part of the new form to which reference is made limits the recovery under the policy to three-fourths of the cash value of the property insured. This clause reads as follows:

"Three-fourths Value Clause.—It is understood and agreed to be a condition of this insurance that in the event of loss or damage by fire to the property insured under this policy, this company shall not be liable for an amount greater than three-fourths of the actual cash value of each item of property insured by this policy (not exceeding the amount insured on each such item) at the time immediately preceding such loss or damage; and in the event of additional insurance—if any is permitted hereon—then this company shall be liable for its proportion only of three-fourths such cash value of each item insured at the time of the fire, not exceeding the amount insured on each such item."

Negro Insurance

A LIFE Insurance Company to be known as the "Ethiopian Mutual Association," which will only operate south of Mason and Dixon's line and which will limit its risks solely to the male negro population, is being organized in Des Moines, Iowa. It will have a capital stock of $125,000.

ANNOUNCEMENT has just been made that the Equitable College Class will be held this year as usual during the month of July. This will be the third annual class and will be the largest of all, as some 150 college graduates will attend. As with previous classes, to be eligible for this one the graduate must have worked his way through college, in whole or in part. The session this year will probably be held on the seventh floor of the Hazen Building, in this city, as the large number of students makes larger quarters necessary than can be given in the home office. As heretofore, the entire proceedings will be in charge of Gage E. Tarbell, Second Vice-President of the Society, and an interesting and varied program has been arranged for each day. The opening session will be devoted to an address of welcome by President James W. Alexander, and an outline of the course by Mr. Tarbell. The sessions will be held daily from 10.30 until 1, excepting Saturdays, there being, of course, no session on July 4th. On that day the entire class will be taken on an outing to West Point.

....The Prudential Insurance Company of America is making a very elaborate showing at the Louisiana Purchase Exposition of diagrams, charts, maps, etc., illustrating life insurance methods and results. The exhibit includes a model of the home office buildings of the Prudential at Newark, N. J., on a scale of ¼ inch to the foot, surrounded by a series of 38 photographs, showing exterior and interior details. A striking feature of the St. Louis display is a stained glass design of the Rock of Gibraltar, the standard advertisement of the Prudential that has become so familiar to every reader of newspapers and magazines, both in this country and abroad. This advertisement was adopted in 1896 and is considered by experts to be the most unique, as well as one of the most appropriate designs, used in advertising. The company issues a finding list that is available to those visiting the St. Louis Exposition.

....*The Journal of Commerce* prints the following revised list of the insurance on the steamer "General Slocum," burned in the East River on June 15th:

St. Paul Fire and Marine	$2,500
Providence-Washington	4,000
United States Lloyds, of New York	4,500
Mannheim, of Germany	5,000
Western, of Toronto	5,000
British America, of Toronto	5,000
Firemen's Fund, of San Francisco	6,500
Boston Insurance Company	15,000
Federal Insurance Company, of Jersey City	12,500
Insurance Company of North America	10,000
Total	$70,000

Financial

Shipyard Trust Civil Suits

PROCEEDINGS in the courts do not permit the public to forget the United States Shipbuilding Company, or Shipyard Trust; but these proceedings are of a civil character, relating to the recovery of damages, and are not designed to enforce the criminal law. Charles H. Kavanaugh, a manufacturer residing in Waterford, N. Y., brought suit to recover the money he had invested in bonds and stock of the company, his claim amounting to $73,375. The trial was to have taken place on June 22d, but it is announced that a settlement out of court has been made. According to the statements of the daily press, Mr. Kavanaugh received $75,000 and is satisfied. In another suit, the complainant is the widow of the late Benjamin Wood. She was induced to pay $195,000 for bonds having the par value of $200,000. Now she attacks the company's prospectus and certain prominent persons connected with the promotion of the enterprise which Receiver Smith called "an artistic swindle." In the suit of H. S. Tavshanjian for $35,000 invested in the bonds, Justice Greenbaum has directed that judgment be entered for the plaintiff. In a suit brought by H. T. Gause, a holder of much stock in one of the subsidiary companies at Wilmington, Del., the demurrers of the defendant Trust Company were overruled by Judge Leventritt. These demurrers, as reported in the daily press, object to the enforcement of certain agreements with Mr. Gause on the ground that the Trust Company had no power, under the laws of New York, to enter into such agreements, and was, in fact, forbidden by these laws so to commit itself. This interesting defense appears to relate to the acts which the New York Superintendent of Banks characterized in his official report as a "flagrant transgression of the laws." Penalties for such violations of the law, as well as for the numerous offenses reported to the court by Receiver Smith, are provided in the statutes; but there is no sign that this phase of the question engages the attention of the District Attorney or of a Grand Jury.

THE first train over the new Pittsburg terminal of the Wabash (and of the Gould system) entered the Pittsburg station a few days ago. Mr. Gould was one of the passengers.

....The $10,000,000 of New York Central 4 per cent. debenture bonds offered recently by J. P. Morgan & Co. and Harvey Fisk & Sons were oversubscribed, and the books were open only a few minutes.

....Net earnings of 101 railroad companies for March showed a decrease of $3,662,000, but the decrease of gross earnings was small. In April the decrease (for 96 companies), as compared with April of last year, was as follows: Gross, $1,736,000; net, $2,540,000.

....A preliminary report from the Interstate Commerce Commission, covering 98 per cent. of the railway mileage, shows an increase of gross earnings from $1,726,380,000 in 1902 to $1,890,150,000 in 1903, and of operating expenses from $1,118,832,000 to $1,248,-520,000. Thus an increase of $34,000,-000 in net earnings is disclosed.

....Dividends announced:

Chicago, R. I. & Pac. R'way, 1¾ per cent., payable July 1st.

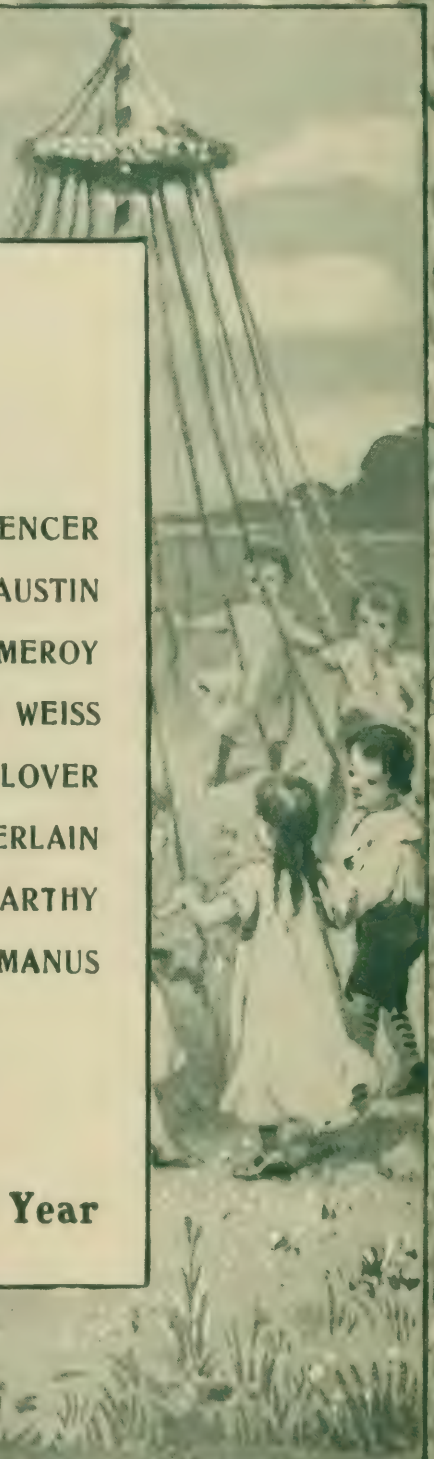
Missouri Pac. R'way, $2.50 per share, payable July 20th.

Am. Woolen Co., Preferred, 1¾ per cent., payable July 15th.

Westighouse Elect. & Mfg. Co., Preferred, 2½ per cent., payable July 11th.

Am. Locomotive Co., Preferred, 1¾ per cent., payable July 21st.

Empire State Surety Co., Brooklyn., 2½ per cent., payable July 1st.



Amer Licorice Co, Preferred, 1½ per cent., payable June 30th.

Southern Pac. Co., various coupons, payable July 1st.

U. S. SEPARATOR

1904 MODEL.

A Triumph of Perfection—Right Up-to-date

NOT ONLY THE

Cleanest Skimming Separator the World Has Ever Seen

HOLDS WORLD'S RECORD

Average Test for 50 Consecutive Runs .0138.

BUT THE

Handiest and Easiest Operated.

The 1904 Model U. S. has the only practical LOW SUPPLY CAN.

Has clutch bushing; no lost motion; as soon as you pull on the crank the bowl begins to turn; and the gearing stops when crank is released.

Safest Machine on the Market; gearing entirely enclosed.

Built for service and efficiency.

Investigate it merits and you will buy none but the U. S.

Read what prominent dairying authorities say about the 1904 Model:

Iowa State College, Dairy Department.
Ames, Ia., March 23, 1904.

Your new 1904 Model (U. S. Separator) has just arrived at our school and has been tested by the students. We find it requires far less power to operate this machine than it did the former style. The lowering of the tank has been a great improvement also. The machines that you have had here from time to time have given excellent satisfaction.

G. L. McKAY (Professor of Dairying).

South Dakota Agricultural College,
Brookings, S. D, March 18, 1904.

The No. 6 U. S. Separator (1904 Model) runs much easier than the old style and is a very attractive and well made machine.

A. H. WHEATON (Professor of Dairying).

WRITE FOR ILLUSTRATED CATALOGUE.
